Books

This list is prepared with the purpose of enabling our Cultivator readers to supply themselves with standard books at lowest possible prices. We call especial attention to a few of the new publications. "Citrus Fruits" by Professor Coit, of the University of California, covers all phases of the Citrus Industry under California conditions—the kind of a book we have had many calls for but never before been able to supply. "Productive Feeding of Farm Animals" by Woll, will command special attention. "Poultry for Profit" (The Cultivator Poultry Book) by Koethen, another California book, is new and excellent, telling what to do and what not to do with poultry in California; a sure guide to poultry success. The new Standard Cyclopedia of Horticulture, by Bailey, is not equalled by anything of the kind which has ever been published at any time in any language. Special terms of payment and discounts are offered by the publishers through us on this Cyclopedia. Write us about it.

Cultivate with a "Baby" Creeping Grip Tractor

Here's the tractor that you have been looking for to handle your ranch work.

This Baby Creeper was designed for the small rancher, particularly the fruit rancher. It delivers 16 Brake and 10 Tractive H. P. and does the work of 6 good horses or mules.

It is low, gets under the trees, turns in its own length, its fuel consumption is very low and it does not require an expert operator

THAT INWARD SHEAR
If you cannot buy a CLIMAX alone, buy with your neighbor. Investigate its greater durability and convenience. If we have no agent or dealer in your locality, get in touch with us at once. Ask any User.

That Inward Shear Saves Power

You can cut easier with a pair of shears near the pivot than out at the points. The last of a cut is the hardest because the fodder is pushed one way or the other. Our inward shear finishes the cut near the main shaft and under the belt; not way out at the point as in other machines. This feature of the

CLIMAX SILAGE CUTTER

is fully explained in our FREE CATALOG, which also explains the power of the feed rolls to draw the fodder in faster. Saves time and labor. The three closed elbows enables you to maintain full pressure into any silo. Be sure to examine these exclusive features of the CLIMAX before you buy any machine. Send for FREE Catalog Today.

One Dollar Yearly

Fall Potatoes for the Sacramento Valley

Written for California Cultivator
By W. S. Guilford

COMMERCIAL potato growing in California will probably always be confined to certain areas where soil and moisture conditions are particularly favorable. The delta region below Stockton should continue to hold first place in tonnage produced, and there in the moist peat and silt soil with moisture under control, potatoes are planted and dug almost any day in the year. Then the Salinas and Lompoc districts are peculiarly adapted to the growing of high class potatoes, and the methods of growing have been worked out with reference to their one crop season and the climatic conditions. But there are places in the great interior valley of California where there is an open, mellow, easily worked soil, where ample irrigation water is available, and where drainage is good, that two crops of potatoes can be raised to advantage—in some instances as a commercial proposition and in many others for the home supply. In fact this home supply can be produced on lands not so light and mellow if the proper preparation is given and they are handled right. By this is meant that a heavy soil may be "lightened" by growing alfalfa on it and by manuring, and gradually worked into the tilth and condition that is necessary for easy working and the application of irrigation water without the baking and cracking that sometimes follows on heavy land and literally chokes the stems and tubers of the potato plant. When this heavy land has been made mellow it should be handled in the same way as will be suggested for the mellow lands mentioned.

In growing potatoes the first thing to be considered is that the crop is in the cool weather class with radishes, lettuce and such crops as distinguished from hot weather crops like melons, corn, etc. The native home of the plant is in the cool valleys in the Rocky and Andes Mountains at an elevation of a mile or higher. There the days are hot and the nights comparatively cool, and there is a rather short period of intense growing weather. The long, intense heat and drouth of the summer period in the Sacramento Valley is not known.

In order to provide conditions as nearly as possible like those in the native home of the potato it is necessary to plant either very early in the season or late so that the intense summer heat is avoided. For instance, potatoes planted in February are well out of the way by May, or before the hottest weather begins. Then the later crop should be planted in August so that it may get started while the maximum growing season

continues, but the tubers may complete their development and mature during the cooler weather in October.

With these climatic requirements of the crop in mind there are certain cultural essentials that must be considered.

First, it is necessary that a good seed bed be prepared. The soil must be plowed deep and disked and harrowed and worked until it is fine and the weeds are well killed out. The moisture content must be such that the potato plant can get a good start before it will be necessary to irrigate. If the rains in the spring have not filled the soil and the subsoil sufficiently with moisture there must be a good irrigation that will send the moisture deep, at least three feet, into the soil, either before the preparation of the seed bed begins or while the work is in progress. This irrigation in August before the fall crop is planted is absolutely necessary.

With a seed bed well prepared the next thing is to do the best possible in the way of securing seed. The most satisfactory seed for planting in warm weather districts and in the Southern states comes from short season Northern places. For instance Maine growers furnish seed for the potato growing sections of the states along the Gulf coast. Seed that is free from disease and grown in Oregon or the higher mountain valleys in California gives good results in the Sacramento Valley. Seed is not imported for every crop, but ordinarily every second year. It is important that the seed be free from rhizoctonia and fusarium, but it has been very difficult to find such during the past year or two. The former is present on the seed potato in the form of little black specks that resemble lumps of dirt, while the latter is indicated by a discoloration that appears when the end of the potato is cut. The remedies for these diseases now recommended are the planting of clean seed on land that has not been infected. When seed potatoes are affected with scab—a roughening of the surface that is quite common—they should be soaked for two hours in a solution made by adding formaldehyde to water at the rate of one pint to 30 gallons.

The seed for the second crop of potatoes for the small planter in the Sacramento Valley will probably be taken from the earlier crop in most cases because this will be the easiest to secure. When this seed is used it should be taken as soon as dug and stored in a cool place as is available, an old cellar for instance, where the tubers will not be affected by the intense summer heat. They should not be piled up, but spread out in thin layers on the floor or on shelves. They should be thoroughly dry when

put in storage and kept dry. Conditions should be such as to prevent sprouting during this storage period if possible because this weakens the vitality of the seed. If, however, sprouts do start they should be rubbed off when they are just starting. If the potatoes are allowed to remain in the sun until they have turned somewhat green before they are placed in storage they may keep better because of the thorough drying and ripening. Potatoes that have been greened should not be eaten; they are bitter and may contain injurious material.

For the early crop, that planted in February, it is an advantage to plant whole seed potatoes that have been allowed to start short, stocky sprouts. By carefully planting these with the sprouts up in a furrow that has been opened up and warmed by the sun for a day or two before planting, the crop will be hastened toward maturity a week or more over a crop grown from seed planted in the cold soil without this previous preparation of seed and soil. But with the late crop there would not be the same advantage because the soil is very warm, and with proper moisture there will be no difficulty in the seed sprouting and coming on fast enough.

To ridge the land where the rows are to be, then split the ridges with a plow, if the potatoes are to be planted by hand in this furrow, or plant with a planter on these ridges, is an advantage with either crop. Planted in this way the crop may be irrigated by running the water in the furrows at the sides of the ridges and an abundance of moisture is provided for the plant through its deep feeding roots without banking and solidifying the soil around the stems on which the tubers form. This can be kept mellow and open and well aired. Many failures in potato growing in the Sacramento Valley have been made because the soil around the potatoes became so hard that it would not permit the tubers to develop properly, and they have been found at digging time to be distorted in shape, of small size and very few in the hill. If this same soil had been formed into good high ridges, a foot high or more and 18 inches wide at the base, and so irrigated that the water did not cover the soil along the sides of the ridge or on the top of it, but simply ran in the furrow between the ridges slowly so that sufficient moisture "subbed" up into this ridge from below, good crops would have resulted.

The best potato growers in Europe use whole seed, and the number of planters in this country who follow this practice is increasing. The advantage in this is that a large amount of nourishment is available for giving the young plant a vigorous start, and

when the tubers are cut for seed it is of advantage to cut the seed pieces large for the same reason.

The second crop of potatoes in the Sacramento Valley is planted in August, and the amount of irrigating required will depend entirely on conditions. If the soil is thoroughly wet well down into the subsoil before the crop is planted no further irrigation may be necessary, but it would not be safe to figure on this. As soon as the soil about the roots begins to get dry water should be applied. No general rule can be given for irrigating, but the best results are most often secured by running a comparatively small stream for a good while, long enough to "sub" the water well into the subsoil. The depth to which the moisture has penetrated can be determined by running a sharp steel rod into the soil. It will go down easily as far as the moisture has, but it is difficult to run it into the dry dirt. The moisture should penetrate to a depth of at least three feet. Cultivation to keep the soil mellow and kill weeds should follow every irrigation.

The supply of moisture to the plant must be uniform; drouth followed by a liberal supply of moisture makes knobby potatoes. This is caused by the growth being stopped or arrested during the dry time and started again by the moisture.

Potatoes may be raised for home consumption almost anywhere and on almost any soil if properly handled, but the larger plantings in the Sacramento Valley should be confined to the lighter soils where irrigation is easy and where other crops can be rotated with potatoes. Then a certain acreage should be grown every year, regardless of the market properties, and the business should be laid out on at least a ten-year basis. Then the average price per year will be satisfactory; there will be some very high and some very low prices, but they will even up. One of the biggest gambles in the farming business is to take a flyer at a crop of potatoes when it looks as though the price for the crop at harvest time may be big. There is a possibility that thousands of others may think the same way about it—and a glutted market result.

But for the grower who has a suitable piece of land and other conditions favorable and who will get the proper equipment and will grow potatoes every year in a district where the bulk of the potatoes used for home consumption are shipped in, there should be a good future for the business. And there is no question about the advisability of a small patch for the farmer who has to buy his supply at the high price that results after the profits of several middlemen are added to the price secured by the original grower.

Relation of a Permanent Agriculture to Social Welfare

By Thomas Forsyth Hunt Before the Annual Convention
of National Real Estate Exchanges at Los Angeles

(Continued from Last Week)

A not unimportant part then of the general problem we are discussing is the fact that the open country cannot afford to support numerous social, religious and racial divisions.

One hot evening last summer I lay on the campus of the University of Missouri, listening to a sociologist while he discussed the rural social conditions in the Southeastern part of the United States. He said that manufacturing industries were being introduced into the cities of the South. The white people were moving into the cities and colored folk acquiring the lands. I know nothing concerning

the facts, but if conditions are as he states, then God pity the Southeastern part of the United States. For it is only a question of time until the cities also will be inhabited by colored people. If families in the cities raise less than two children and families in the country raise three or more it does not require a profound mathematician to show what will happen.

The census bureau of the United States divides population into urban and rural. The urban population is composed of all persons living in towns of more than 2500 inhabitants; the remainder comprises the rural population. On this basis there are 1,500,000 more persons in the urban popula-

tion between the ages of 25 and 44 years, that is of breeding age, than there are in the rural communities. On the other hand there are 6,000,000 more children under 14 years of age in the country than there are in the cities. If we assume that all persons between the ages of 25 and 64 may be considered parents and all persons under 25 may be considered children, then we will see that every couple in the city raises a little less than two, while every couple in the country raises a little less than three children. This is of course quite inaccurate from a statistical point of view, but it answers for the purposes of comparison. In making this comparison, it

must be remembered that a considerable body of young people between the ages of 15 and 24 have moved from the country to the city, while but few have moved from the city to the country.

As long as the people in the country raise larger families than those in the cities and the cities continue to grow faster than the country, it follows that in the cities every generation must be affected by the character of the previous generation in the country.

New York and Boston are rapidly becoming un-American cities for the simple reason that they do not raise enough children to maintain, let alone

(Continued on Page 5)

Don't Plant CITRUS TREES

until you can meet the five essential requirements of success. Here they are: Sufficient Water Supply; Quality Trees; Safe Thermal Conditions; Good Care; Good Soil.

These five things are fundamental and he who ignores any one of the five invites failure.

Good fruiting trees are good revenue producers, and if you have the requisite water, location and soil—true citrus land—you cannot afford to miss the opportunity to

Plant Citrus Trees

Place your order NOW for Spring delivery. You will perhaps never have another chance to buy **QUALITY TREES** at so reasonable a price. Even the so-called **CHEAP TREES** which might better be called **EXPENSIVE TREES** by the man who expects to receive an adequate return on his investment, are quoted the same or very little less.

We were founded twenty-five years ago, and have been improving the grade ever since. Buy **TEAGUE QUALITY TREES**, embodying vigor and symmetry of root, body and top—and in the selection of buds, which will not only be true-to-name in the general acceptance of the term, but true to the best type of the varieties to which they belong as well.

Write today for prices and particulars. No orders too large or too small to fill. All correspondence promptly answered.

Our booklet "CITRUS CULTURE" sent to any address on receipt of 25c.

San Dimas, Cal.

RECEIVER'S PUBLIC SALE

Nursery Stock to be Held at Claremont, Cal.

Wednesday, July 7th, 1915

Peaches, Pears, Apples, Olives, Citrus and a large variety of Deciduous Fruit Trees, Ornamental Plants, Shrubs and Trees, Roses, etc.—To be sold to highest bidder, at office of Claremont Nurseries, Twelfth Street and Indian Hill Blvd., City of Claremont, Los Angeles County, California.

All stock is divided in blocks and will be sold as it stands.

Particulars regarding parcels, contents of each parcel and any other information regarding the sale will be furnished upon application to the Receiver.

Possession is acquired on day of sale, and growing stock may remain in the field until the next digging season, by making arrangements with the present owners of land. Labor can be arranged for, by contracting with responsible parties, now in the employ of the Receiver.

Sale continued to following day if necessary.

TERMS:—1-3 of purchase price at time of Sale, Balance in Ten Days.

Fruits

TOBACCO CLOTH OVER ORCHARDS

SOME 15 years ago the Cultivator gave illustration and description of a lath house built over an orchard at Riverside. We believe this orchard was entirely of oranges. The idea was two-fold, primarily to protect the fruit and trees from frost; also to learn regarding the effect of tempering the sun's rays by this structure. In fact, in the Cultivator of October 24, 1902, Mr. Everest, manager of the orchard which was covered, writes:

"Fruit does not seem to be affected unfavorably by leaving a cover over the orchard during the summer, unless shortage in crop can be laid to shading of trees. There is little loss of moisture by evaporation where ground is protected by this shade, and trees contain practically no split oranges or sun-burned fruit. Ripening is delayed about two weeks, but quality is not affected unfavorably."

So apparently there was fear that even an unfavorable result might be secured. The structure consisted of redwood posts, 18 feet long, connected by pine one-by-fours braced, and all stayed with diagonal wires. The covering was of lath placed the same distance apart as their own width (requiring 50,000 lath per acre), thus shutting off one-half of the sunlight and aiding in retaining the heat to a degree during frosty nights. Mr. Everest writes in 1902:

"We have found the covering a sufficient protection against such frosts as have visited us since its erection about four years ago, though some tender growth was nipped this winter where lath sagged and sun entered freely."

The cost of the structure was about \$450 per acre. Its frail nature, coupled with the fact that the results were not all that could be desired, led to its removal, and we believe the experiment was not duplicated in any other orchard. One objection to the lath house construction was the fact that it furnished a "cold" shade.

Since attention has been called to results secured in tobacco fields of the South by the use of so-called tobacco cloth (a very light fabric of which over 40,000,000 yards are used annually in the South) the National Orange Company proceeded to cover with it a small tract of less than two acres of its lemon orchard in Corona. The tobacco cloth gives a much more effective "shade," or condition within the tent, the air is usually warmer, and as light as the fabric is the tem-

perature during the cooler nights will run about four degrees higher than outside. The great objection, and the one which makes tobacco cloth structures impracticable, is the cost. It is, however, cheaper than lath house structure, though instead of \$450, which is reported as the cost of the lath house, the tobacco cloth structure costs about \$400 per acre. With lemons selling as they are this year such cost means loss, for no matter what the quality of the fruit it is not selling this year at profitable figures.

Through the courtesy of Messrs. Waterbury, Garthwaite and Custer the editor of the Cultivator recently made a trip to two orchards at Corona in which plots have been covered with tobacco cloth. The first of these orchards visited was that of the National Orange Company owned by the Chases of Riverside. Mr. Frank Chase was at the orchard at the time of the visit and referred to the fact that it was a most interesting experiment, but from a practical standpoint with the average price of lemons he did not think it would ever be generally used in our orchards. The life of the cloth is about two years, though in that time it requires much repairing. The repairing is done by using a portable platform which is moved from place to place as needed. The first photograph on cover page gives the outside appearance of the covering. The gentlemen in the picture are Mr. Chase, whose face is almost lost out at the extreme left; by him is Prof. Lipman speaking to Mr. G. W. Waterbury. Mr. J. W. Garthwaite occupies the center of the picture, and the gentleman by the machine is Mr. Custer. The upper view to the right is on the larger tract in the Flagler Orchard of which Mr. W. C. McCully is manager. This shows only a portion of the Flagler covering. At the extreme right of the picture is the ranch house. The lower picture at the left, in which Messrs. Waterbury and Custer are standing near the center and Mr. Garthwaite is holding some of the fallen cloth, shows how the wind and the weakening cloth get the best of the structure where it is not given prompt and regular attention.

We did not see the readings of the instruments, one of which is maintained within and the other without the covering, but in general may say there is slightly greater humidity of the air within the tent, slightly higher temperature, and that the wind velocity is slightly lower.

Must Eat More

THE production of oranges is increasing twice as rapidly as is our population. As to markets now reached, they are handling nearly the capacity of the orange groves of the country. If the increase of output continues and there is no material increase of population, nor of consumption, the orange grower must be content with lower prices. How to increase the consumption of oranges has been the subject of serious discussion on the part of the management of the California Fruit Growers' Exchange. To the end that the most intelligent consideration might be given to the matter, eastern representatives of the exchange who have had to do with advertising were requested to come to California to learn more of our orange and the situation it has created and give to the management their best thought regarding these problems. Messrs. R. J. Grassley, advertising manager for the exchange, and W. T. Kestner, vice-president and general manager of the Lord & Thomas Advertising Agency of Chicago, which concern has handled the advertising of the exchange

for the past six years, together with several other of the eastern representatives of the exchange, have been attending the conference during the past two weeks.

In order to get in touch with the situation these representatives have visited the orange groves and packing houses and received information from those who are directly managing the campaign for greater consumption of California oranges. On last Wednesday several hundred growers gathered in Los Angeles and listened to addresses by Manager Powell and these gentlemen.

Mr. Powell stated the case squarely, in effect that Americans must eat at least twice as many oranges as they are eating today. They must look at oranges more as the Italians look at olives, as a regular feature of their diet. The Italians must have spaghetti, olives and olive oil and lemons; these are their staples. The Americans depend more largely upon meat. The healthfulness of a more extended fruit diet must be told to the people. Americans must drink more orange and lemon juice in the morning before breakfast and in the

evening after dinner. Instead of shipping 10,000 carloads of Valencias as we are doing now, we will soon be shipping 20,000. These will all come in competition with the peaches and apples and small fruits grown all over the country. The healthfulness of the orange must be emphasized. No other fruit is given to the public as is the orange, hermetically sealed; no matter how it is used it must be peeled before eating.

In Mr. Grassley's address he enlarged upon one feature of the advertising of California citrus fruits; the campaign had been absolutely honest. No inflated statements have been made as to its food value, but its general healthfulness and its attractiveness have been brought out in a way to appeal to every consumer. He urged upon the growers more than any other one thing the necessity of uniformity of output. If "Sunkist" brand is to be made a greater asset of the exchange it must be known only to appear on boxes of fruit which are of uniform quality. He even referred to the fact that a high-grade orange put under a medium grade label is objectionable. The few higher grade fruits mixed in would surely make the consumer dissatisfied and give him the feeling that the lower grade fruit was an inferior article which had been foisted upon him.

Mr. Kestner's address had to do with the professional or service end of advertising. He referred to several campaigns in addition to the campaign of making known the word "Sunkist." He spoke of the fact that some of the important advertisers of the country had built up such a business under their trademarks that now the trademark was considered worth millions of dollars. This is exactly the kind of campaign into which growers of California are entering with "Sunkist." This ultimately should be an asset equivalent to the orange groves of California.

The advertising of the exchange has been placed more largely in women's journals or those in which women have most general interest, for the reason that 59 per cent of the family income is spent by the women.

D. W. Francisco, assistant to the general manager of the Chicago office, gave a most interesting address touching upon the work of encouraging retailers to make display of oranges. He has found that one representative concern in a large town making a large window display with a low rate per dozen is more apt to secure a fair price to the consumer than is a definite effort toward lower prices. He has found that many grocers will buy sufficient "Sunkist" oranges to secure banners and the usual advertising matter which goes with them, then go to the trouble of repacking inferior fruit in the "Sunkist" boxes. This policy has been discouraged, and while it may always continue to a certain extent the exchange will see that its rights are not set aside.

It is admitted by the management of the exchange that this campaign results in the selling of more California oranges and even more Florida oranges than would have been sold otherwise, that is, advertising of "Sunkist" oranges makes a market for all oranges. Of course, the great effort of the exchange is to burn in the word "Sunkist." The \$275,000 being spent annually on advertising by the exchange makes an investment on the part of the grower of a little more than one per cent of his income from oranges. Some large concerns which have been building up along the line of advertising have spent as high as 10 per cent or 15 per cent on advertising and still made great sums of money. One large automobile concern with a business of approximately \$20,000,000 or somewhat less than that of the exchange, has spent annually in excess of \$2,000,000 in advertising.

California oranges must claim the greatest place in the eastern fruit market. It will be secured because of the superior quality of this fruit and by a persistent and regular course of advertising which will inform the consumer of its quality.

PERMANENT AGRICULTURE

(Continued from Page 3.)

increase, their population. Almost exactly one-half of the people of Manhattan are foreign born. Less than 15 per cent have two American-born parents. Los Angeles has become the puritanic center of America; Boston is now the second Dublin of the world; Hoboken does not dare to have a parade on the Fourth of July. Unless our children occupy the country our grandchildren will not occupy the cities. It is the people who occupy the land who will eventually inherit the earth.

Unless conditions radically change in three generations, or by 2015, the majority of our people will be descendants of peoples not now living in the United States. I do not say that the population will have retrograded; I trust it will have greatly improved, but I do assert that our progeny will be in the hopeless minority. The world has never before met the problem of enormous masses of people living in the cities. We can see the buffaloes disappearing, but we seem blind to our own fate.

We hear a good deal these days about the best men of nations being sacrificed in the terrible conflict that is now raging and the effect this is going to have on humanity. As a matter of fact this is of small consequence compared to what is going on in America (and elsewhere). The flower of the human race is unborn. It is not in the trenches.

About a week after the incident to which I have previously referred I was traveling across the prairies of western Kansas. Passing a boy, perhaps 14 years of age, possibly only 12, who was driving a load of wheat to the elevator, my companion remarked, "That boy is earning \$2.50 a day." He sat there as proud as a peacock. He was earning more than \$2.50 a day. The experience he is obtaining before reaching the age of 21 will be worth more to him than any bank account he will ever acquire.

The following are probably safe propositions:

No race nor any portion of any race increases abundantly unless the children are a material asset.

Farming is the one great industrial occupation in the United States where children are of economic advantage.

The training which children obtain in thus contributing to the family income is a factor of great importance to society. No equally efficient substitute for this training has yet been discovered.

In the long run it is of no particular advantage to any person to own a farm unless he intends to raise thereon a successful family.

Eventually society will probably, for its own protection, reserve the use of all agricultural lands for persons who wish to use them for that purpose.

What is said to be happening in Southeastern United States has happened, is happening and will continue to happen in many, indeed in most rural communities, unless there is a very great change in existing conditions. The only difference is that the color line does not exist and most people do not notice the changes which take place. It is however just as easy to trace them. Let us see what usually happens:

A farmer raises a family of from three to five children that are born while the parents are between the ages of 25 and 40. Assume the parents live until they are 70. Of necessity therefore the youngest member of the family is 30 years of age. Ordinarily all the members of the family have obtained a foothold in some other business or have acquired an earning capacity which they do not wish to sacrifice in order to accept the responsibility of the farm. The usual result is that some other nationality or race, with different economic, educational, social and religious ideals, takes the farm. With the death of the father the old Scotch Presbyterian or Irish Catholic disappears and the existing church languishes. Even if it is not a new race, but merely a plain American tenant, the condition is not much better; often it is worse.

Let us assume another case, which is the normal one, as is shown by insurance statistics. A farmer marries between the ages of 20 and 25, has four children before he becomes 40 and between the ages of 55 and 60 dies, possessed of a farm worth \$16,-

000. Under these conditions he may readily have one son of the age to assume the management of the farm. What must the son do? Having inherited one-fourth of the property, he must assume the indebtedness of the other three heirs, or an obligation of \$12,000. If there were a system of finance by which he could spread the payments over say 30 or even 20 years he might be able to work his way out. Under present conditions a sale often occurs and the land passes into other hands.

If farms must be recapitalized at least three times in a century; if young men are born into the world without capital to finance them; if the permanence of society is dependent upon a rural population, not merely be-

cause it creates wealth, but because it grows children, then what are we going to do about it? To a man looking down from Mars without local prejudices it would seem that the system of finance which is so successful in other industries might be applied to agriculture.

The proposed land credit system is merely the well tried system of worldwide finance applied to agriculture. It is a means of putting farm mortgages on an investment basis. Stated in its briefest terms, it provides for loans payable in fixed annual sums of both principal and interest, secured by first mortgages on agricultural property, to approved borrowers and under approved conditions, for periods not to exceed, say 35 years, with interest at not less than, say, four per cent. To make this operative, the nation, state or community may create a land mortgage bank, with a trust fund, by legislative appropriation or otherwise. The trustees of this bank may issue and sell mortgage collateral bonds on the fund and on the mortgage securities of the fund not to exceed, say, 20 times the paid-up capital. The trustees may be authorized to frame regulations for the organization of rural credit associations and to make loans secured by first mortgages to members of such associations. These bonds may or may not be guaranteed by the nation or the state. Such guarantee would doubtless enable the sale of the bonds at a lower rate of interest, at least at the beginning, but it is not necessary to the operation of the land credit law.

Recently there came across my desk the annual statement of a life insurance company. Idly turning its pages I noticed that this company possesses \$258,000,000 worth of railway bonds. These are nothing more than debentures secured by mortgages on railway property. The only difference between these railway bonds and land credit bonds is that the railways never intend to pay back the principal, while in the case of the land credit bonds the principal must be paid back in annual installments covering a period of years, say anywhere from 20 to 35 years. It is proposed not only to build railroads, to establish manufacturing plants and department stores, to pave streets, to construct water works and power plants, to erect courthouses, hotels and apartments, and to install luxurious restaurants, most of which is now done with other people's money, but also by means of land credit to build in the open country comfortable homes containing children.

The arguments sometimes made against land credit systems that farm securities are not for various reasons looked upon favorably by banks and because of these unfavorable conditions higher and varying rates of interest must be charged, is the strongest possible argument in favor of land credit measures. It is proposed to give character to farm securities so that a higher rate of interest need not be charged. By creating a liquid asset it is proposed to make a uniform interest rate to all whether they are near or remote from great centers of capital.

How would this system work? Suppose the nation, state or community sells those collateral mortgage bonds at 4½ per cent and adds ½ per cent to cover expenses, thus charging the mortgagee 5 per cent, what annual payment would discharge the debt and interest in 25 years? Answer: Seven per cent of the principal.

Ambassador Herrick in his book on rural credit shows that in 12 countries the annual dues, including interest, cost of business and fraction of the principal required of the borrower for amortizing the debt, form an annuity of only 3½ to 7 per cent of the loan. In other words, the farmer in the countries named is given at least one generation, in some cases more than two generations, for paying back a loan, against three to five years in the United States, while the annuity is smaller on the average than the interest rate alone in the South and Western states." But the conditions are very different in other countries. Precisely so. That is exactly the reason that the conditions should be changed in this country. Under an efficient land credit system the rate of interest on farm mortgages will be dependent upon the money rates current in New York, London, Berlin and Paris, and

not upon the exigencies of a local bank. There is no more difficulty in Berlin dealing in American debentures secured by farm mortgages than those secured by railway mortgages.

The basic reason for issuing collateral bonds against land, as for issuing railway or industrial bonds, is that it is not proper for banks to use their deposits for long-time loans. All long-time loans should be taken up by people who wish to invest their earnings. For years the savings of the people have been used in developing railways, manufacturing plants, department stores, public buildings and city streets. A large part of the development of private corporations as well as the public improvement of cities has been due to the savings of the people, borrowed largely at 4 to 5 per cent. The land credit plan is intended to allow the savings of the people to be invested in the land in order that a permanent agriculture may develop.

Men in cities now conduct great enterprises, enjoy comfortable transportation facilities, occupy luxurious offices and eat in sumptuous restaurants without having a dollar of their own money invested in these agencies except as they may carry life insurance or invest in stocks and bonds. The phenomenal development of the cities within recent years would have been impossible were this not so. Farming is the one great industry remaining in

which men commonly invest their own money in order to engage in the business.

Some months ago the Commonwealth Club of San Francisco spent a dinner and an evening discussing this subject of land credit. For several hours the pro-Allies and pro-Germans of this subject held sway. After it was over two Australians rushed up to me and said: "We have been very much interested in this discussion. We do all these things in Australia. From our point of view there is nothing to discuss. We do it now." So they do. So do 13 other countries.

Some high-minded but impulsive people have discussed seriously the bringing of Belgians to the United States and placing them upon the land. There is about as much probability of the Belgians coming to America in large numbers to settle upon the land as there is that this audience will migrate to Siberia. Any industrious Belgian farmer can borrow money at 4 per cent and have 60 years in which to pay it back.

While the leading nations of the world are in competition to retain and increase existing population we sit tight in smug content, promoting a system of finance and land development which leads inevitably to our own extinction without one gun ever being fired. To us the war in Europe is a small matter in comparison.

Deciduous

Fruits

IS THE LINNET A PEST?

Written for California Cultivator by
H. C. Bryant, Game Expert, California Fish and Game Commission

Of all the native birds of California the linnets, or house-finch, is accused most widely of destroying cultivated crops. The fruit grower especially complains that the linnets not only eats the ripening fruit but also cuts the buds, thereby greatly reducing the crop.

On the other hand many people who do not grow fruit, but who are interested in bird life, defend the linnets as a beautiful songster. The rancher is therefore often in a quandary to know whether this bird should be protected or destroyed. Let us examine some of the evidence for and against the bird and then decide how to attack the problem.

There is no doubt that the linnets destroys fruit buds. Damage however is often overestimated. The United States biological survey in one of its publications dealing with the birds of California in relation to the fruit industry publishes several letters from prominent ranchers in the state reporting damage caused by this bird. The same publication, after giving the results of the examination of over 1200 stomachs, says: "Examination of linnets stomachs does not reveal any very considerable number of blossom buds, and it is probable that but little of the alleged mischief to fruit blossoms is done by this bird."

As a destroyer of fruit the linnets takes first rank. Several years ago a man reported to me that out of a crop of figs which netted 2000 pounds he had to send 500 pounds to the jam factory as bird-picked fruit. Here is apparently good evidence that linnets and perhaps other birds destroyed about one-fourth of this man's crop. Such evidence is convincing, but it must be remembered that the damage caused to a small isolated crop of fruit is much more apparent than that to a larger crop.

Probably the best method of preventing damage in such instances is that used by many ranchers in the vicinity of Fresno, where a practice of hiring boys and men to shoot linnets during the fruit season is made. This method is made inexpensive by using "shot cartridges" in some small-bore rifle such as a 22 or 32. Linnets are usually so numerous however that it takes a great deal of patient work to make any impression on their numbers.

The poison method is always an exceedingly dangerous one and should be avoided wherever possible. Not only are the lives of all other birds endangered but also domestic animals and even human beings.

On the other hand it should be borne in mind that in many districts fruit is not grown to any extent and the depredations of linnets are unknown. Many people in these sections very naturally frown upon any attempt to destroy the bird which they find a seed-eater and beautiful songster.

Then, too, as has been the case in almost every instance where depredations of birds are concerned, much evidence has been of the circumstantial type. When linnets are seen in a budding peach tree the rancher immediately infers that they must be destroying fruit buds. Later on if the crop does not come up to that of a former year he immediately blames the linnets. Without doubt the linnets oftentimes does some damage in destroying buds, but the evidence should be clear before any attempt to reduce their numbers is made. It is an easy matter to test your suspicions. You can either examine the stomach-contents yourself or send it preserved in alcohol to the university, where an examination will be made and a report sent you.

If you think that linnets are destroying the buds on your fruit trees, or the fruit, take the trouble to obtain absolute evidence. Kill some of the birds and examine the stomachs in order to prove or disprove your theory. Meet the emergency then by either defending the bird as a seed-destroyer and a beautiful songster or by reducing the numbers by shooting.

The farmer who takes a middle ground and appreciates both of the points of view discussed above and who tests his evidence comes nearest taking the proper stand in regard to the linnets.

METHODS OF QUICKENING THE GERMINATION OF SEEDS

It is almost always desirable to hasten the germination of seeds, not only that plants may be obtained more quickly, but also that their long exposure to the enemies which exist in the soil and destroy them, or many of them, if seeds are allowed to remain in the ground too long before germinating, may be avoided. As a general rule the fresher seeds are, the quicker they germinate, and with the exception of the cases here enumerated it

is desirable to sow, as far as possible, the last seeds to ripen on any given plant. The exceptions are

First—Where double flowers are desired, as in the case of zinnias, china asters, etc.

Second—Where plants are likely to be ruined by an excess of growth at the expense of heading, such as in the case of lettuce, cabbage, etc.

Third—Where plants are liable to produce leaves at the expense of flowers and fruits, as in the case of tomatoes, cucumbers, melons, etc.

Other things being equal, seeds preserved in their natural envelopes up to the time of planting germinate much better and more quickly than those which have been washed and preserved without covering, even if kept in paper or cloth bags in a dry, equable temperature. With few exceptions all seeds with fleshy coats should be preserved in their natural covering as long as possible. When their natural covering is removed, if the planting time has not come, it is always safe to place the seeds between layers of fine sand containing at least 10 per cent of humidity and so preserve them from direct contact with the atmosphere. Seeds of the grapevine washed and dried at the time the fruit ripened and then placed in bags and sown the following spring, germinated only in the proportion of eight to ten to the 100 the first year, while others did not germinate until the second or third year. The plants produced by these had the seed-leaves nearly always blotched with white. A part of the same seed preserved in their pulp to the end of December and then placed in sand until the sowing time, germinated much more quickly and in the proportion of 75 to 80 in 100. The same precaution is necessary in the case of various large oily seeds, such as the seeds of oaks, the tea-plant, the camellia, laurels, chestnuts, beeches, etc., which lose in a large part their power of germination if preserved during the winter in bags, and require to be sown as soon as ripe, or, at least, to be preserved in sand, and so prepared for germination when the time for sowing arrives. This is the best method, too, in the case of seeds with bony, hard covering, which germinate slowly, such as the seeds of the olive and of most of the rose family, nut-bearing plants, etc. There are also a number of vegetable seeds which take a long time to germinate, such as those of the parsnip, carrot, sugar beet, parsley and tarragon; these are improved by being placed in layers of sand before planting, although their germination can be hastened by more active treatment. Many systems are in use for this purpose among gardeners. Sometimes good results are obtained by mixing seeds of this character with fine soil and then, after placing them in a pot or sack, plunging them for some time into hot water. Others soak such seeds for a longer or shorter time, varying from six to forty-eight hours, in tepid water, to which is added a little salt or chlorine. Some gardeners soak carrot and beet seeds in liquid manure for two or three days before sowing them. All such methods are generally good if they are carefully used.

I have read of certain Indian fakirs being able to cause seed to germinate in a few minutes with a little powder which they sell afterward to an astonished public without disclosing their secret. They are probably very skillful prestidigitators, and their process consists in changing the seed rapidly.

I do not recommend the method of hastening germination which consists in plunging seeds into water strongly impregnated with potassium or caustic soda. The strength of these salts is so great that if a coffee seed is dropped into a solution made with them germination takes place at the end of a few hours; but seeds so treated, instead of continuing to grow, perish when they are transferred to the soil.

It is said that electricity stimulates germination. Experiments which I have made in this direction have only given moderate results, although I recognize certain results which make me suppose that with proper appliances electricity would be a powerful and efficacious means of making old seeds or seeds with hard and bony coatings germinate quickly.

I have secured the germination of seeds in half the ordinary time by plunging them during a period varying from six to 36 hours, ac-

cording to the hardness of their coats, in water to which was added one-tenth of its volume of the liquid ammoniac of commerce.

Any process which facilitates the transformation of the starchy parts of the seed into glucose and renders it assimilable by the embryo, favors its development and hastens germination. Air, humidity and heat being the indispensable agents for this, it only remains to select the substances best suited to aid these agents in their work. That which appears to me the best is ammoniac. In practical application it is best applied in the form of fresh horse manure or horse manure refreshed with horse urine, which should be used either mixed with other substances or alone, and which for this purpose should be placed in a

FROM OLD TULARE

"Tulare, California, June 21, 1915.

Please find enclosed one dollar for the renewal of my subscription to the Cultivator. This marks the 22nd year that I have taken the paper and there is something to interest me every issue.

"Respectfully,

"C. EDMONDSON."

We hope Mr. Edmondson will continue to take the Cultivator for another 22 years and we assure him we will endeavor to merit his kind words and make the paper better with every year.

bed in a warm greenhouse. I have caused in this way the germination of pear and grape seeds, nuts, plumstones, almonds, the seeds of the coffee tree, of palms, sugar beets, peanuts, fraxinella and other seeds of slow germination in half the time needed to secure the germination of the same seeds sown in the ordinary condition. In the case of beets, beans, lupins, and other plants of the pulse family, the use of heated soil produces the most deplorable results on account of the rapid development of the cotyledons, which results in the breaking and destruction of many embryos when the seeds are treated in this way. For all such seeds it is recommended to immerse them for six or eight hours in slightly heated water, which softens the coating of the seed and facilitates the exit of the germ.

There are certainly many additions to make to the examples I have cited, my object being simply to indicate methods of making experiments through which, perhaps, results may be reached which will be of use to future generations of gardeners.—J. B. Weber in the Revue Horticole.

THE JORDAN ALMOND

Written for California Cultivator
By J. W. Mills

The Jordan almond has not met with much favor in California for two reasons. First, while it is an early bearer it is also an early bloomer, one of the earliest, hence is very liable to be caught by the frost. Secondly, it is a sure enough hard shell and is only

marketable to the trade in the kernel, and being long and slender it is more liable to breakage when the cracking is done by machinery. In 1912 I ordered 400 pounds of hard shell almonds for nursery planting and half of the order delivered were Jordan.

FROM AUSTRALASIA

In our issue of May 13 we referred to complaint in a recent issue of an Australian paper because of the quarantine by our state horticultural commission on fruits intended for the Panama Pacific Exposition. The Australians would doubtless have exercised great care and would have chosen their fruit from districts in which there was no Australian fruit fly. However, we supported the attitude of our horticultural commissioner because the magnitude and importance of the California fruit industry justified this extreme action. Of course to a certain extent the regulation worked a hardship on the Australian people. They wished to show the great advantage of their country as a fruit producing section, and our exposition is for the purpose of encouraging just such demonstrations. Referring to our article Mr. Frederick Maskew wrote commending the attitude of the Cultivator and calling attention to the importance of our fruit industry: "I am sending you clipping taken from the Sydney (New South Wales) Herald, in its issue of March 26, 1915:

"On all sides there appears to be a prejudice making itself felt against New South Wales fruits. First of all New Zealand, then the United States, and now South Australia are having laws enforced to protect their own fruit industry and also to prevent the spread of the dreaded fruit fly pest. One would naturally think that in this state the most stringent regulations would be enforced and every endeavor made to wipe out this pest. It is not perhaps a good policy to advertise the

fact that we have such a pest, but unless growers recognize the necessity for more stringent enforcement of the fruit pests act and assist the inspectors in their work the fruit industry must suffer. It is strange that the greatest enemy to the fruit grower's interest is the fruit grower himself.

"Why does the imported fruit from oversea or neighboring states give our fruit such a setback on our own markets? Simply because the growers from those parts have long since learned to understand what freedom from disease, packing and grading mean. Fruit fly is certainly bad in many of our districts. In the Hawkesbury, Patterson and other coastal districts after January one finds growers picking peaches and soft fruits as hard as nails so as not to incur loss from the pest. Late fruit cannot be grown to perfection because of the pest. The kerosene trap method of attracting fruit flies is admitted to be a splendid means of suppression, but the number of growers using these traps is not commensurate with the advantages gained. What an admission! And yet many growers refuse to believe in fruit pest legislation. In point of fact the matter is not regarded seriously enough. Penal clauses should be included in the act, if not already there, but when available they should be enforced."

From this it will be seen that the attitude of other countries is similar to that of California and, best of all, right thinking people appreciate the need of just such action, even if their interests are in the quarantined country.

QUERULOUSNESS.

"What are your politics?"

"It depends a great deal on who happened to make the speech I read last," replied the querulous person. "I'm getting so that every time I read anybody's speech I find something in it that makes me feel like voting for somebody else."

If it were not for water, the great Southwest would still be a desert land. Crops depend upon water for success—therefore the up-to-date rancher should by all means install a pumping system he can absolutely depend upon at all times.

If the LAYNE & BOWLER PUMPING SYSTEM is installed, the irrigator need never have any fear of a breakdown at the critical time. Write for Catalog No. 30. It's free. Exhibit at San Francisco Exposition.

THIS MONTH IN SOUTHERN CALIFORNIA

Written for the California Cultivator by O. M. Morris

JULY is really the harvest month for the earlier planted crops. As soon as these crops are harvested the ground should be thoroughly cleaned off and if possible summer fallowed or plowed up. If there is plenty of water available for irrigation it is advisable to flood the ground and then plow and harrow.

If planted soon there is yet time to mature a bean crop. For inland valleys the tepary would in all probability be best; however, the Mexican pink or the little navy will mature satisfactorily. Corn, either field or sugar, potatoes, lettuce and most other vegetables can be planted for early fall crop. It is advisable to use the earlier maturing varieties of corn. For field corn best varieties would be Wisconsin White Dent, King Phillip or Yellow Flint, as these will succeed better than any of the other varieties. Any of the varieties of sugar corn can be grown.

Cabbage and cauliflower should be sown for plants for late summer planting. These will be ready to transplant in about six weeks, also winter peppers and tomatoes. Probably the best pepper for planting now would be the large bell; of tomatoes would recommend Earliana and Chalk's Early Jewell.

As soon as new potatoes are thoroughly ripened they may be planted any time up to the 15th of August, though the sooner they are in the better. It is essential that the seed be thoroughly ripened before planting. It is best to spread out under trees or in the shade in thin layers on the ground and allow to ripen in this manner. It will ripen much more quickly than if left in piles and will not be so apt to rot. To avoid scab dip potatoes in a solution of formaldehyde, even though they show no signs of the disease. The process is inexpensive and most profitable.

An industry which is looking toward this coast for its future supply is that of pickled cauliflower. This vegetable has been a very uncertain crop throughout the Eastern states, and certain large pickling factories are now looking to California. This vegetable is packed down in salt brine and shipped in casks to the factory, handled in a manner similar to cucumber pickling. We are informed by one concern that they imported from Southern France 800 large casks of this pickled cauliflower last season but because of war conditions they are forced to look elsewhere for this season's supply. Cauliflower for early fall and winter is a fairly sure crop in this district. Up to the present it has been handled exclusively as a fresh product, being shipped East for winter vegetable supply.

UNDERSTANDING THE SPUD BUSINESS.

By Eugene H. Grubb in Denver Field and Farm.

As I travel around the country I do not see that the people are of one type or of one mind or in any way disposed to cooperate to any extent, whether in securing uniform seed, raising a uniform variety of given product, cooperating to develop the same breeds or to keep the weed pests out or disease down. Each man, true to the spirit of American independence, seems to be doing things in his own way. Of course my specialty is potatoes and I am working night and day to bring something out of nothing so that some day the American people will come to realize the true value of the spud in all its important relationship to our national economics and domestic efficiency as to the cost of living.

The first thing to remember is that seed potatoes must often be procured from some new source. They run out and must be renewed every few years.

We are gradually learning how potato diseases spread and these must be combated. Storing them in a cellar where diseased potatoes were kept the year before, cutting healthy seed potatoes with the same blade that has passed through an inoculated spud, running them through a planter with a diseased potato here and there, are some of the ways by which whole fields are contaminated at once. Letting the ground become wet and soggy, lack of cultivation to loosen it up and get the sunshine and air into it, planting good seed on ground where a diseased crop grew the year before are some of the mistakes men are making and for which they are paying a terrible sacrifice.

It appears to me all the more distressing when I see these things developing on new farms where conditions ought to be nearly perfect. I have made a number of trips abroad, studying agriculture on those old farms in England, Scotland and Germany

The Lawn and

Flower Garden

THIS MONTH IN SOUTHERN CALIFORNIA

Written for California Cultivator By O. M. Morris

FLOWERING perennials for winter and spring bedding should be planted. If possible sow the seed under lath covering or in beds which may be temporarily shaded. Penstemons, digitalis, coreopsis, snapdragons, and plants of this nature may be left in this bed, if thinly planted, until wanted for re-bedding in the winter. A convenient small bed could be constructed of footboards, making a cold frame and covering with either burlap or muslin. Plant the seed in this and keep covered for the first 20 or 30 days, after which time the covering can be removed and the plants left in the bed until wanted in the fall and winter.

All bulbs that have dried down should be cared for now. Beds should be either mulched over with straw or litter for all tender bulbs, or if other planting is to be made in the same bed it is best to dig the bulbs up and store them. Such bulbs as daffodils, in fact, all the narcissus, if the bed can be kept perfectly dry, will summer through all right, but it is necessary that they have no water until growth starts in the fall. If watering is continued the bulbs are apt to go blind the next season, that is, they will give no flowers the following season.

Pansies and stock for early winter bloom should be put in within the next thirty days. Pansies should be planted in a well-protected bed—a cold frame would be best—with a good heavy shade or burlap covering. Stocks require but very light covering, but pansies must be kept thoroughly shaded and very wet at all times, at least for the first 30 days.

Shrubs and ornamental tree seeds may be planted. Most of these may be handled in the same manner as the perennials, allowing them to grow in the seed bed until wanted in the fall and winter.

Rake up the grass clippings and spread about your rose plants two or three inches deep. They will break the effect of the hot sun and aid in the retention of moisture. The secret of success with roses consists in the liberal use of plant food and repeated prunings to encourage development of new branches. Blossoms come only on new growth. Cut back each branch after flowering.

where they have been farming right along for 2000 years and are raising twice as much to the acre as we are, and always sure of their crops. There is much for us to learn and it is not to our credit to despise their methods. They use good seed; they prepare the ground scientifically; they plant carefully; they cultivate, harvest, sort, pack, sell and get the money. We work on a larger scale, make more mistakes, waste more and fall down more quickly.

We boast of 500 or 600 bushels of potatoes raised on an acre, but at the Dalmeney farms in Scotland they have run the record up to 2050 bushels on the measured acre. They understand their business so well and are so systematic that they can work along in their adverse climatic conditions and beat us two to one, and it is due to knowing how and doing it the best known way. I wish our farmers could be induced to cut down their acreage one half and give themselves the pleasure of farming the reduced acreage twice as well, doing less work on the half than they have been poorly doing on the whole, receiving as much income from the half as from the whole and at less expense. If they would try this for just one year they would get so much more satisfaction and profit that they would never return to the old slipshod way of farming.

ERADICATION OF DANDELIONS

The dandelion, like the poor, is always with us. To maintain a lawn free from this pest means in most parts of the country a constant warfare, and we have at present no methods of eradication to recommend which are easy or permanent. The following methods which are employed are more or less successful according to locality and the persistence with which they are followed.

Thick Seeding

Any means by which a thick, vigorous growth of lawn grass is maintained will greatly aid in the control of lawn weeds. Bare spots and thin sod invite a growth of weeds. Occasional sowing of new, clean grass seed, well raked into the bare spots, together with annual fertilizing, should be practiced.

Digging the Dandelions.

This, the most common control method employed, is quite effective in removing the large plants, if persistently followed and properly done. Unfortunately the piece of root left in the ground is capable of sending up one to six or more sprouts from the cut end, especially if not cut deeply. A one-inch chisel or long-bladed knife are suitable tools, and the work is easiest done after a rain or irrigation while the ground is soft. The plants should be cut as deeply as possible, and the plants destroyed to prevent ripening of the seed.

Spraying

The use of iron sulphate at the rate of one and a quarter pounds to the gallon of water, applied in the form of a fine, forcible spray upon the lawn has proven effective, at the agricultural college in this state, in greatly reducing the number of plants and in some cases entirely eradicating them. Three applications about ten days or two weeks apart should be given just after the lawn is mown. No water should be applied during the next 24 hours. The grass will turn dark at first, but soon recovers and usually appears more vigorous than before. This work appears to be the most effective when done during midsummer and early autumn. Gasoline applied with an oil-can at the rate of about a teaspoon in the crown of each plant is quite effective in killing the large plants, and is useful in conjunction with the other methods.—B. O. Longyear, Colorado Agricultural College, Fort Collins.

Panama-Pacific Exposition Night Illumination. View from Main Entrance. The Jewel City is Wonderfully Beautiful at Night.

COMING EVENTS

NEXT week is a busy one. A vast number of the events scheduled will have little interest for most of our readers but to give an idea of the inclusiveness of the program and special events we give almost entire special features. The following events are all within the dates of July 5-12 and so far in the exposition program mark its most interesting week.

Conventions

National Congress on Recreation, beginning Monday; National Editorial Association, beginning Monday; Navy League of the United States, beginning Monday; California High School Teachers' Association, beginning Monday; Pi Beta Phi Sorority, beginning Monday; Classical Association of Northern California, beginning Monday; Girls' Friendly Association of America, beginning Monday; International Press Congress, beginning Monday; Conference of Amateur Press Associations, beginning Monday; Alpha Chi Omega Sorority, beginning Monday; California Press Association, beginning Tuesday; Grand Interfraternity Council of the United States, beginning Tuesday; California State Rural Letter Carriers' Association, beginning Tuesday; California Drug Clerks' Association, beginning Tuesday; American Association of Museums, beginning Tuesday; Association of Retail Sheet Music Dealers of the United States, beginning Tuesday; Baptist Young People's Union, beginning Wednesday; National Leather and Shoe Finders' Association, beginning Wednesday; Gamma Eta Kappa Fraternity, beginning Wednesday; National Federation of Musical Clubs, beginning Thursday; Actors' Equality Association, beginning Thursday; International Milk Dealers' Association, beginning Thursday; National Council of Women Voters, beginning Thursday; American Association of Journalism Teachers, beginning Saturday; Philological Association of Pacific Coast and Modern Language Association of America, beginning Saturday; State University of Iowa Reunion, beginning Saturday; Theta Delta Chi Fraternity, beginning Saturday; Congress of Federal Suffrage Association, beginning Sunday.

Music

The world famous John Philip Sousa and his band of 80 musicians, daily. Also Conway's great band of 50 players. Philippine Constabulary band of 90 players, Marine Band, Great Exposition Orchestra of 80 pieces and daily recitals on the \$50,000 exposition pipe organ.

Special Days and Special Events

Monday—Independence Day Celebration; Playground Boy's Week; Ancient Order of Hibernians Field Day.

Tuesday—Grand Interfraternity Council Day; Shoe and Leather Industries Day; Pacific Coast Press Association Day; Kalamazoo, Michigan, Day.

Wednesday—Bridgeport, Connecticut, Day; International Conference of Women Workers to Promote Peace Day; Nevada Day; Redding, Pennsylvania Day; California Press Association Day; Lowell, Massachusetts, Day; International Milk Dealers' Association Day.

Thursday—"The Trojan Women," a tragedy of war and peace, presented by the Chicago Little Theater Co., Thursday and Friday nights; Gamma Eta Kappa Day; Nashville, Tennessee, Day; Virginia Day; National Federation of Musical Clubs Day.

Friday—Actors' Day; Erie, Pennsylvania, Day and Springfield, Massachusetts, Day; Theta Delta Chi Day; Elks Day; Great Celebration; Baptist Young People's Union Day; Panama-Pacific International Exposition Tennis Championships; Press Club Day.

The following week's program is not yet fully announced but one event of interest to viticulturists of California is the International Viticultural Congress, which will be held in San Francisco, July 12-13. Several thousand wine makers and vineyardists from every state in the union and from many over-sea nations, will take part in the campaign of world-wide publicity which will be inaugurated to make the fermented juice of the grape the universal table drink. A special train of wine-makers will come from New York.

Another great day which religious people the world over are planning for is The Lord's Day Congress, which will be held July 27 to August 1. Noted men from 21 foreign nations will be present at this congress. Sunday excursions and theatrical performances, together with commercialized Sunday amusements, saloons, etc., will be discussed from the standpoint that they are foes of Sunday rest laws.

OF AGRICULTURAL NOTE

Among the more important agricultural conferences to be attended by experts of international note, may be mentioned the Society for the Promotion of Agricultural Science, August 7; The American Society of Agronomy, August 9; Association of American Agricultural Colleges and Experiment Stations, August 11; American Farm Management Association, August 9; International Congress of Farm Women, August 31; American Pomological Society, September 1 and the Universal Corn Convention, August 5 to 6.

It is interesting to note that of the 325 gatherings, 528 are national in character and 57 international, with but 172 strictly California conventions. The remainder include those of Pacific Coast activities.

Today, Thursday, is Oregon Cherry Day.

Exhibited by a concessionaire is a hog motor which is a sort of cafeteria for swine where the hog must do the work or get nothing to eat.

The Dogs of All Nations are shown by another concessionaire who has arranged as an attractive feature a series of trials.

During the month of July the subject of "Modern Rural Schools" will be discussed at the farm center meetings. The majority of the school houses in this county were built 20 or 30 years ago, thus making them far from modern structures. The interest the farmers are showing in this movement is more than timely and we hope that much good may result from these meetings during this month.

The squirrel campaign which we are conducting in this county is meeting with more than satisfactory results. The farmers are very ready and willing to take up this work. The poison barley which we have been furnishing has been sold to the farmers at six cents per pound, this being

the cost of the materials necessary for its preparation.

The farm center meetings will be held throughout the summer as usual and we anticipate better attendance than during the winter because of better roads. I find that usually we have on an average of 50 persons in attendance at the meetings. We have 16 such centers. Thus you will see that this work is reaching the majority of the farmers in the county, and I might state that the farmers are not of a disposition that they are so often given credit for, namely, unwilling to be shown or have new points of farming brought to their attention.

One thing that more than anything else limits the possibilities of my work in this county is the time element, there being more calls at all times than I can attend to, even though the horticultural commissioner has been very kind in answering some calls.

I have during the past ten months secured positions on the ranches for approximately 125 men who were out of employment. In this way the farm adviser movement has in this county helped to a certain extent to solve the labor problem in bringing the farmer who wants help and the unemployed in touch with one another.

It appears to me that the position of farm adviser has unlimited possibilities. A person might be especially well trained in veterinary science and in this way more than pay for the money expended by the county for his expenses, or he might be an expert in cooperative movements showing the farmers how to cooperate and in this way again making the movement very popular and successful.

I have so far found that a farm adviser must necessarily be a person who has been reared or partially educated on the farm or he will not be able to meet the requirements the farmers demand.

Yolo County, Niles P. Searls, Adviser, Woodland

Esparto, Wednesday, July 7.

Rumsey, Thursday, July 8.

West Sacramento, Friday, July 9.

Winters, Monday, July 12.

Madison, Tuesday, July 13.

Davis, Wednesday, July 14.

Clarksburg, Monday, July 19.

Knights Landing, Wednesday, July 21.

Woodland, Thursday, July 29.

Yolo, Wednesday, July 28.

Not discouraged by the dissolution of the Yolo County Cow Testing Association, several of the old members have announced their intention of securing the necessary help from the University Farm in this county and keeping up their herd books. It is believed that a student can be obtained each Saturday who will be glad to run the tests on three or four herds a month.

As soon as the requisite number of cows can be again procured, the testing association will be started. There is no likelihood of this being possible before next spring. There have been sold about 200 cows from the association number, and at present they can not be replaced.

Madera County, Thomas C. Mayhew, Adviser, Madera

Madera, July 2.

Dixieland, July 6.

Fairmead, July 9.

Chowchilla, July 12.

Eastin, July 15.

Raymond, July 20.

Nippinnawassie, July 22.

Oakhurst, July 27.

Coarse Gold, July 28.

North Fork, July 29.

The farm adviser will not take his vacation during the summer months. Inasmuch as the weather conditions are more favorable to visiting than in the winter work will continue during the summer.

As to the value of the farm bureau's work in Madera County we quote from the Madera Tribune:

"The social value of the farm units throughout Madera County is something that is vividly brought home to a stranger who attends one of them. Whether at Alpha, Fairmead, Chowchilla, Oakhurst, Eastin, Coarse Gold or any of the other units the pleasant social atmosphere that sur-

6,000 Miles Guaranteed

will hereafter be the basis of service for all Pennsylvania Oilproof

VACUUM CUP TIRES

—per guarantee tag attached to each casing.

This also applies to all tires now in service.

This increase in guarantee follows logically the result of the Automobile Club of America Official Test—in which strictly stock Vacuum Cup Tires on heavy cars averaged 6,760 miles.

On this new guarantee basis, V.C.'s are 17% to 22% lower in cost per mile than any so-called non-skid tire sold on a 3,500 miles adjustment basis.

The new guarantee also covers VACUUM CUP TIRES FOR FORD CARS

adding 50% to the service warranty of these special price V.C. casings—already unapproached for economy.

When writing advertisers, mention the Cultivator.

rounds these meetings is one of their chief charms. Always a little volunteer program is put on, of music, singing, recitations, or story telling. The meetings are presided over by one of the members of the unit. Farm Adviser T. C. Mayhew makes a little talk, sometimes on the value and importance of agriculture, sometimes taking up some specific subject, such as an insect pest, or one of the many other problems that come before a farmer in his work.

"People who ordinarily would have but a nodding acquaintance with each other are brought close together, they talk over matters of interest, exchange experiences and derive benefits from such intercourse that are incalculable."

Glenn County, W. H. Heileman, Adviser, Willows

Bayliss, July 1 and 2.

Ord, July 5 and 6.

Larkin, July 8 and 9.

Codora, July 12 and 13.

Jacinto, July 15 and 16.

Dates after July 20 will be filled according to the needs of the work throughout the county.

Arrangements have been made whereby the Bayliss center will hold a meeting the first Friday evening of each month, the Larkin will hold a meeting the second Friday evening, and the Jacinto center will hold a meeting on the third Friday evening of each month. The Ord center will hold its meeting on the first Tuesday night of each month, the Codora the second Tuesday night, and the Orland center the third Tuesday night of each month. The effect of this is to establish regular night meetings for each center throughout the county.

The monthly directors' meeting will be held at Willows at 10 a. m., July 7. The county board of supervisors have been invited to attend this directors' meeting and take luncheon with the farm bureau officers.

During the month the various centers in Glenn County have made progress in their drainage and power extension campaigns and have been working on the organization of dairy and hog breeders' associations. The farm centers in the county are taking up the method of discussing some special problem or crop at each meeting. One of the centers is making concerted effort for the extension of rural free mail delivery.

As rapidly as the organization of the dairy and hog interests of the county are completed, effort will be made for the establishment of cow-testing associations, and also a study will be made of marketing conditions throughout the county.

On July 5 the Ord-Bayliss-Jacinto farm centers will hold a celebration and picnic on the Sacramento river, about two miles north of Ord. The Codora and Larkin farm centers will also hold a celebration on the Sacramento river, adjacent to the Butte City road. These celebrations will be some miles apart and are so located as to permit attendance from different parts of the county. These farm center celebrations have been advertised throughout the county, and invitation is being extended to everybody who wishes to enjoy a day of recreation. A good program has been assured and very satisfactory arrangements have been made for caring for the people. Speakers from the university will be in attendance at these celebrations.

IF DAD COULD!

The impecunious artist had brought home a little bottle of medicine for his small daughter. It was unpleasant looking stuff, and she demurred at taking it.

"But," pleaded her father, "poor old dad has spent his last dollar for this medicine."

Touched the little child took the draught.

But a little later she sidled up to her father. "Dad," she said, "if—if you fink you could afford it, I'd like to frow this up."

It is remarkable how a few shrubs, flowers and trees will add to the value of the farm home. In no other way that we know can a few dollars enhance the value of the farm and make the place a more desirable home. When we think of it, isn't it strange that there should be any homes without trees, shrubs and flowers?

Questions

THE EDITOR

and Answers

AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Leaf Spot Fungus

I enclose leaf from mammoth blackberries affected with the leaf spot. Will spraying control the trouble, and will it affect the berries?—Subscriber, Yorba Linda.

Prof. H. S. Fawcett answers: "The blackberry leaves appear to be affected with the leaf spot fungus, *Septoria rubi*. Professor R. E. Smith recommends as a treatment for this disease spraying with Bordeaux mixture three or four times at short intervals of about ten days, the first application being used when the buds are beginning to unfold. I do not believe any particular good would be accomplished by spraying at this time. It might be well however to burn the affected leaves in the fall after they drop off."

Ticks in Chicken House

Am sending you ticks from an old chicken-coop. There are thousands of them in cracks and crevices of old coops which have not been used for months.—Subscriber, Kern County.

These are good, healthy specimens of chicken ticks, one of the most persistent pests once they are established in an old chicken house. In "Poultry for Profit," Mrs. Jean A. Koethen gives the following: "The tick or bedbug of poultry closely resembles the bedbug found in dwelling houses. It is found only in certain localities, usually on very sandy soil, but where it does exist it is a terrible pest. The Maine station's bulletin on poultry management says the sprays recommended for mites will destroy ticks as well, but California poultrymen have found painting or spraying the infested house with corrosive sublimate solution (eight ounces of corrosive sublimate to 20 gallons of water) the most effective remedy. When houses can be tightly closed they may be fumigated with sulphur or formaldehyde or with the cyanide process used for citrus trees. With ticks as with other pests the best remedy is prevention. A house that is kept perfectly clean is not likely to be infested."

"Green Lady Bugs"

I am greatly troubled with green lady bugs, sometimes greenish with black spots and sometimes with black stripes. They are on cucumber and other vines.—Subscriber, Corning.

We trust our subscriber at Corning will not slander the beneficial little lady bug by connecting it in any way with diabrotica, which is green

with black stripes or spots. This is always injurious, while the lady bug is the farmer's friend. The lady bug is usually yellow or orange in color and should always be protected. These fellows with the black spots or stripes should be destroyed. We would refer our inquirer to the Cultivator of June 24, 1915, regarding their control.

Slobbers

What is the cause of slobbers and how cured?—E. H., Manteca.

If E. H. had given name we would have been glad to have sent copy of the Cultivator of June 17, 1915, which gives information regarding this trouble.

Fraudulent Use of Mails

If one believes the United States mails are being used to spread information regarding fraudulent schemes and wishes to notify the proper authorities who should be informed?—Subscriber, Orange County.

Write at once to Post Office Inspector, 319 Federal Building, Los Angeles.

Poisoning Squirrels

Have used strychnine in watermelons, oranges, etc., but perhaps I used too much. What is proper dosage for half an orange or a pound of wheat?—Subscriber, Upland.

Regarding poisoned grain we presume the best formula is the one recommended by the United States marine hospital service. Some years ago it made a fight against ground squirrels in this state because of the fact that they carry ticks which spread bubonic plague. This formula is as follows: Whole barley, 20 pounds; starch paste, one pint; strychnine sulphate, one ounce; saccharine, one dram. The barley is placed in a receptacle large enough to permit thorough stirring (as a wash tub). One pint of water is then brought to a boil and sufficient laundry starch (about two tablespoons dissolved in

a little cold water) is slowly added to form, when well cooked, a paste about the consistency of cream. The strychnine (first powdered if in crystals) and the saccharine, are now added to the hot starch paste and the mixture well stirred until dissolved. While still hot this is poured over the barley, mixed well, and the whole put aside for several hours before using. Scatter a teaspoon of the poisoned grain along the squirrel trails on hard places near the holes. The poison should not be placed in heaps on the soft mounds at the mouths of the holes. It will probably be found most efficient if scattered early in the morning between the hours of three and seven a. m. Poisoned grain should not be placed in wet weather. Its destructive properties will not deteriorate with age so long as the grain is kept dry and free from moisture.

In using strychnine with fruits care must be taken not to smear over the surface because this will make the fruit bitter and the pests will not eat sufficient to cause death. As a rule a bit of the powdered strychnine on the point of a knife, put under the skin of a fruit or hidden as far as possible in whatever form the fruit is given, succeeds the best. Always leave some portion of the fruit not poisoned so that the taste for more may be encouraged.

Not Moulting.

What does it indicate when I find my hens with a thick growth of new feathers in the middle of June, without having dropped their old feathers? They stopped laying a month ago, but are healthy and vigorous. Can I hope for fall eggs from them or will they moult this fall? It's a new wrinkle to me and I wonder whether I had better sell them off.—Subscriber, Inglewood.

Evidently the feed you have been giving your hens has gone to make feathers rather than eggs, why I cannot say without knowing more of the history of the hens. If they have not dropped their old feathers they must drop them sooner or later, but are you perfectly certain that they have not dropped them a few at a time? It may be that you have been feeding heavily of oil meals and other forcing foods. Sometimes such feeding induces a moult at the wrong time, but I never heard of its causing a spring moult. If your hens were hatched in the fall this might help to account for an eccentric moult. There is considerable uncertainty about the first moult of

(Continued on Page 19.)

geles, California, as Second-Class Matter.**Thursday, July 1, 1915****OUR ADVERTISERS RELIABLE**We guarantee our subscribers against
loss through dishonesty of any adver-
tiser in the Cultivator. We do not at-
tempt, however, to adjust trifling dif-
ferences between subscribers and honest,
responsible advertisers, nor will we pay
the debts of honest bankrupts. Notice
of complaint must be sent us within 30
days from date of the transaction, and
the subscriber must have mentioned the
Cultivator when writing the advertiser.**EXPERIMENTS ON ALKALI**In "Experiments on Alkali Soil
Treatment" a preliminary report is be-
ing mailed by the University of Cali-
fornia press. It is by Professors Lip-
man and Sharp. The paper is a tech-
nical one, giving description of vari-
ous experiments tending to show, in
a word, the possibility of using cheap
sulphuric acid to reclaim alkali land.
This report has much of novelty and
we hope a great deal of utility in its
suggestions. It will be followed by
a more complete report of experiments
yet being carried on.**TRADEMARKED GOODS**Some months ago seven dif-
ferent farm publications with circula-
tions in different parts of the coun-
try made a canvass amongst their
subscribers as to purchases of adver-
tised, especially trademarked, goods.
The canvass shows conclusively that
once the public is informed of the real
quality of any trademarked goods it
prefers to pay an increased price for
the insurance given by such goods. It
is also interesting to note that as a
result of this canvass California shows
a larger percentage of sales of brands
of advertised goods than any other
state. For example in the matter of
soaps the brand which is probably bet-
ter advertised than any other received
by far the greater number of votes, or
rather in the return as to purchases
made this particular brand was strong-
ly in the lead. In California, out of
293 answers 61 preferred Ghirardelli's
chocolate. Competing, or other brands
in the market, numbered 28. One
point which the consumer recognizes
is that the concern that throws thou-
sands and sometimes millions into ad-
vertising cannot afford to jeopardize
its reputation by ever putting out an
inferior article.**AN ADVANCE IN FUMIGATION**For more than a quarter of a
century fumigation has been used to
a degree at least in controlling fruit
insects, especially those of the citrus
orchard. It took many years of in-
vestigation and practice to perfect
it, and even yet it is not perfect in its
workings. Originally it was found that
the effect of the light on the hydro-
cyanic acid gas was such that the
work must be done at night. Since
then it has been one perpetual fight as
to form and material for tents which
would give efficient service. Leakage
has been considered in every dosage
table and still must be.This however, we believe is in a
large part overcome by a process
which has been used with more or
less success for the past year or two.
This, in a word, is a machine for mix-
ing the liquids and injecting the gas
underneath the tent and doing it in-
stantaneously instead of by the usual
slow process conducted in a vessel
underneath the tent. The slow gen-
eration in the vessel required about
15 minutes to secure the entire
strength of the gas. This permitted,
with the best of tents, a loss of more
or less of some of the first gas gener-
ated before the other was added to it.
Now the entire strength is placed with-
in the tent instantly. We use the
word "instantly" advisedly for the rea-
son that once the liquid cyanide of
potassium, or rather sodium, is mixed
with the diluted acid an explosion re-
sults and every bit of gas is injected
within the tent.This means that from the very first
moment of treatment the full strength
of the gas is operating on the insects.
Of course leaking will result, as in the
former case, but it takes a longer time
to dilute the gas below the point of
efficiency.It is to be hoped that one result of
this new appliance will be to make
possible the use of lighter dosage,
which means economy, likewise less
injury to fruit and to tree. Some en-
thusiasts believe that this means also
daylight fumigation, which again will
add to the economy and certainty of
the work. However, methods for the
time being will be much as formerly
excepting the use of the machine for
instantaneous generation.**DON'T BE DISCOURAGED**What the California cured fruit
producer will do with his fruit this
year is a problem with which he is
wrestling at this moment. If he can
pull through a season such as this
promises to be and make the expenses
of curing and marketing his fruit, he
will prove himself a most worthy busi-
ness man. The market which has
heretofore taken the greater portion
of the California cured fruit product
is closed either by the war or by lack
of funds. If the American consumer
were in a better position financially
he would be able to handle much of
California's surplus, but with such a
year as this his purchasing power is
very low and it seems that even a well
directed advertising campaign would
have little effect in inducing greater
consumption.As a rule the grower is sitting tight
and making no unfavorable contracts.
The Kings County growers recently
gathered and discussed a proposition
which has been made to them by a
packing company, but finally decided
to keep their products entirely within
their own hands unless a more favor-
able proposition were made. In this
they were certainly wise, for accord-ing to the terms of the agreement
which this concern wished the grow-
ers to sign, fixed charges were to be
made to the growers as follows: For
receiving, grading and sacking
peaches, apricots and prunes, one-
fourth cent per pound; receiving, grad-
ing and packing in 50-pound boxes,
one-half cent per pound; in 25-pound
boxes, unfaced, five-eighths cents per
pound, and the same, faced, seven-
eighths cents per pound. An over-
head charge of \$4.00 per ton will be
made, and a selling charge of \$3.00
per ton, and in addition six per cent
of the returns will be deducted to
cover what are known as trade dis-
counts. A storage charge of 50 cents
per ton will be made on crops held
after February 1, 1916.In presenting this matter the com-
pany wished the growers to under-
stand the prices would probably be
extremely low, in any case not to ex-
ceed three and a half cents per pound
for peaches in the sack. At such
figures and with such charges the
growers could secure better results by
turning hogs into their orchards to
eat up the waste. In any case don't
let a shipper tie up a contract which
will cause a greater loss, and don't be
discouraged.**DON'T BE BUNCOED**The time was when the farmer
was the butt of all jokes, and unfor-
tunately it often seemed justly, be-
cause of his being an easy mark. But
the professional man and the financier,
especially the financier, have been
caught so many times that the farmer
can smile and look at the other fellow.
Perhaps warning might be given along
various lines, but particularly we wish
to give a warning which the Cultiva-
tor has given before, that is in the
matter of plugging trees. For a score
of years we have been giving warning
of the fact that this process was, so
far as could be determined, worthless,
and yet is it everlastingly bobbing up.
A few weeks ago we repeated the cau-
tion given many years ago. We are
glad that our state university is mak-
ing an investigation of a new propo-
sition for ridding trees of insect pests
by placing a substance in a hole bored
into the heart of the tree.Prof. George P. Gray has the matter
in hand and reports the latest material
offered to the public along this line
—which it is not necessary to name
—but it is safe for the orchardist to
keep in mind that these methods will
bear investigation before he ruins an
orchard by boring the trees full of
holes. The powder referred to has
been analyzed at the state university
and shows the following content: Po-
tassium nitrate (saltpeter), 2 parts;
sulphur, 5 parts; iron compounds
(chiefly oxide and carbonate), 1 part.Prof. Gray adds: "It is evidently a
fake of the crudest sort. The circulars
accompanying the package make such
sweeping claims and are gotten up in
such a crude manner that I believe any
thoughtful person would immedi-
ately classify the "remedy" as a fake.
The ingredients in themselves are com-
paratively harmless so that the user
is, in this respect, only humbugged at
the rate of \$2.00 a pound. The most
serious part of this propaganda, how-
ever, is the very doubtful practice of
indiscriminately plugging the trees.
It is believed that great harm can be
done in this way which may not be
manifest for a year or more. I no-
tice that this matter of plugging trees
was discussed in the California Cultiva-
tor of April 22, 1915."The California insecticide law was
originally worded so as to protect the
consumer against just such frauds as
this. Amendments to the law, how-
ever, have made it very difficult to
effectually prevent the sale of such
materials which in themselves are
comparatively harmless even though
valueless as insecticides or fungi-
cides."**Agricultural Notes**The freight rate on Manila hemp,
from Manila to New York, has ad-
vanced since the war began from \$15
per ton to \$40.15.The coming olive crop in Andalusia
gives promise of being a very good
one. Producers also have a large
stock of oil on hand.Drouth has seriously damaged crops
of rice and hemp in the provinces of
Albay and Ambos Camarines in the
Philippines. The loss in rice alone is
estimated at \$5,000,000.A shipment of California ripe olives
was made to Australia on June 9.
Many inquiries have been received
from that country as to dehydrated
olives. The Australians call them de-
natured olives.The United Fruit Companies of Nova
Scotia, a cooperative society of or-
chardists and farmers throughout the
Annapolis Valley, have opened a store
in Halifax and will sell butter, eggs,
vegetables, apples, and other country
produce direct from the farms to the
producer.This year's sugar beet crop in the
United States was estimated by the
Department of Agriculture on June 1
at 6,290,000 tons. Colorado has the
largest acreage planted, 171,000 acres.
Michigan is second with 146,600; Cali-
fornia third with 128,900. The aver-
age yield indicated is 10.6 tons per
acre.A recent investigation into the cost
of sugar beet growing in England
showed that the expense incurred by
the farmer in growing an acre of sugar
beets was approximately \$40, repre-
senting a cost per ton of beets of \$4.15.
The charge for loading and transpor-
tation brought the cost of the beets de-
livered at the factory up to \$5.10 a ton.Since Japan has been in control of
Korea—renamed by it Chosen—syste-
matic afforestation has been under-
taken. The denudation of the moun-
tains has caused serious losses from
drouth and flood. April 3 has been
made a national holiday, an Arbor
Day, when everybody is encouraged to
plant trees. More than 12,000,000 were
planted on Arbor Day in 1913.American cotton intended for Rus-
sian factories has piled up in Vladi-
vostock awaiting the long haul over
the Siberian railway. A special com-
mission has been formed to expedite
transportation and distribute the raw
cotton to factories in the Moscow dis-
trict. This commission has been prom-
ised by the government the use of
ten cars per day, nevertheless the
factories fear they cannot operate con-
tinuously. They have been forced to
use much Caucasus cotton which is
of an inferior grade.German hops are mainly used in the
production of beer, and those which
are not so consumed at home are
shipped abroad. Beer drinking in Ger-
many, however, has declined and ex-
portation is interrupted. The prices re-
main low, while only the poorer grades
are sought. Inferior varieties from Al-
sace recently brought \$4.70 to \$5.50 per
100 pounds. The highest price obtained
for the best Bohemian variety (Saazer)
was only \$23 per 100 pounds. No re-
cent quotations for Bavarian hops have
been given, but the prices obtained
since the war have been poor, offering
a marked contrast to the record price
of \$107.30 for the best sort in the year
1911. Hop culture declined in some
districts of southern Germany about
25 per cent. The decline in Bohemia
is reported as even greater.

Agricultural News Notes

of the Pacific Coast

Northern California

Entries for the poultry show to be held at the Panama-Pacific exposition close October 15.

Over 1000 people attended the cherry carnival of the San Juan Ridge in Nevada County.

The Alameda County farm bureau held its annual picnic and election of officers at Newark Park, Saturday, June 19.

The Gravenstein Apple Show at Sebastopol is to be made an eight-day affair this year. It will open on Saturday, August 14.

Nearly 100,000 pounds of hops were disposed of within the past two weeks in Sonoma and Mendocino Counties. Contracts have been made at 12 cents.

Swine breeders of Solano County met at Dixon June 16 to organize a swine breeders' association. The meeting was called by Farm Adviser Mills.

Governor Johnson has signed the Chinese egg bill. Under the provisions of the bill the word "imported" must be stamped on all egg cases containing foreign eggs.

A poultry, livestock, agricultural and mineral exposition has been planned for Redding early in September. Committees have been appointed to arrange for the various exhibits.

The new head of the agricultural engineering department of the University of California has been selected in the person of J. B. Davidson, who has held a similar position at Ames, Iowa.

At the sweet pea flower show held in the Palace of Horticulture on the exposition grounds at San Francisco 1500 vases of flowers were displayed. The American Sweet Pea Society directed the show.

Two hundred dollars is to be given in cash prizes for almond displays at the Esparto almond festival. G. W. Pierce of Davis has been named chairman of the county committee on arrangements.

Grain growers are facing a serious shortage in bags. A large consignment is expected to arrive from Calcutta very soon but this will not meet the demand. Harvesting has begun in several sections.

Berry picking in the Gold Ridge and Green Valley sections of Sonoma County is now on, and large quantities are being shipped to Eastern and Southern points. Growers expect to realize good prices for the season's crop.

Speaking of the increase in acreage planted to rice in the Sacramento Valley since 1912 C. E. Chambliss, a rice expert connected with the United States department of agriculture, said that in three years the acreage had increased from 1400 to 30,000.

The American Poultry Association will hold its next annual meeting in San Francisco November 14-21. Other poultry organizations which will meet during the same month are the American Buff Plymouth Rock Club, November 18; American Buff Plymouth Club, Pacific Coast Division, November 18; Buff Minorca Club of America, November 20, and the American Pigeon Fanciers' Association, November 24.

Central California

There is a movement to organize the Salinas Valley Cattle Association.

Dairymen in the vicinity of Tulare received over \$80,000 for May deliveries of cream.

Fumigation work against gray scale in Tulare County will commence about July 15.

Denair now has the largest local farm bureau in Stanislaus County. It has 125 members.

The board of directors of Stanislaus County has been requested to appoint a county statistician.

There will be a meeting of the Modesto farm bureau on July 6 at the Modesto irrigation district offices.

Santa Clara County growers estimate their county will produce 62 per cent of the prune crop of the state.

Stanislaus County has 16 local branches of the county farm bureau, with an enrollment of more than 20 per cent of farmers of the county.

The board of supervisors of Monterey County has appropriated \$1000 to aid in construction of trails in the Monterey national forest as a fire protection.

Members of the Chowchilla unit of the Madera County farm bureau are buying grain bags cooperatively. Members will also buy a threshing machine to be held in common.

The district fair association of Fresno County and the city beautiful committee of Fresno will cooperate in a flower show. Seven hundred dollars is to be offered in premiums for best cut flowers.

The fruit standardization bill passed by the last legislature becomes effective August 7. After that date all green fruit packed for shipment outside the state must come up to the standard of quality and packing.

The Woodlake, Tulare County, Co-operative Cannery has perfected its organization by election of the following officers: W. P. Crumley, president; James H. Blair, vice president; J. G. Ropes, secretary-treasurer.

Fresno has been designated as an inspection point for plants sent by parcel post. F. P. Roullard has been appointed inspector at Fresno. Bakersfield, Madera and Hanford also have been named as inspection points.

The Associated Raisin Company is reported to have taken over the Farmers' Union packing plant at Dinuba, Fresno County. This is the last of the independent packing plants in that city, others having already been taken over by the Associated.

Immigration Commissioner Caminetti announces that the employment departments established by the United States government through the local post offices have resulted in finding enough laborers to harvest all the crops in the Sacramento and San Joaquin Valleys.

The state highway commission has advised Kings County that as soon as the county is ready to buy \$50,000 worth of highway bonds, work on the lateral will be started in this county. The extra amount is necessary owing to the fact that the road will cost \$105,000 instead of \$70,000.

Southern California

Both fruit canneries of Pomona will open the first of the month.

Brawley ships a carload of mixed vegetables by express daily.

More than a third of the Valencia crop of Southern California orchards has been marketed.

Cotton is being shipped from Brawley to New Orleans for export at the rate of two carloads a day.

Dairymen members of the San Diego County farm bureau are contemplating formation of a cow testing association.

The Almond Growers' Association of Banning is expecting a very large crop this year. They will be obliged to increase warehouse facilities to handle it.

Four mountain lions were killed by N. W. Palmer in the southern part of San Luis Obispo County, after the lions had killed 14 of his Angora goats. The bounty will amount to \$80.

Manager Dreher of the San Antonio Fruit Growers' Exchange says that prices now being received for Valencia oranges are the highest for this time of the year for six seasons past.

Horticultural Commissioner Beers of Santa Barbara County says that the walnut blight which appeared so serious earlier in the season is largely disappearing as the warm weather comes on.

Orange County is talking of forming a bean growers' association. The plan is to install bean machinery in orange packing houses as the oranges will be out of the way in time for the bean harvest.

Prices of feed, prices of eggs, and farm cost accounting were the three main topics of discussion at the meeting of the Arlington poultry association recently held at the Arlington public library.

Instead of the 50,000 acres of beans which directors of the Lima Bean Growers' Association set as the minimum with which the association could conduct business only about 35,000 were signed up.

Beet dumps will be opened about July 20 to take care of the beet crop of Garden Grove, Orange County. It is stated that the yield in that section will average one ton per acre over last year's.

One lemon orchard at Corona, Riverside County, has a section containing over seven acres covered with tobacco cloth. The installation of this feature of lemon growing costs in excess of \$400 per acre.

The report that withdrawn lands in Imperial Valley were to be thrown open to settlement immediately has been officially denied by Gratz Helm, in charge of adjustment of rights of the settlers to certain of the withdrawn lands.

The El Cajon Valley News states that Game Warden Toms has given out information that the law that protects cottontail rabbits will not be enforced against ranchers who find it necessary to kill the rabbits in order to protect their crops. It is said that the animals are increasing very rapidly and are becoming a pest in many localities.

The Coast

Utah will have the biggest sugar beet crop in its history, both as to acreage and yield.

Farmers of Higley, Arizona, are organizing a local branch of the farm improvement association.

One million pounds of wool changed hands at the first wool sale held at Pilot Rock, Oregon. The highest price paid for coarse wool was 26 5-8 cents.

Progressive dairymen in the Glendale district of Arizona are asking that an attempt be made to organize a cow testing association, to enable them to improve their herds.

Egg buyers of Portland have decided to buy eggs according to grade and to form an organization to educate farmers and country merchants in the advantages of producing and marketing eggs of quality.

Tillamook County, Oregon, produced almost 40,000,000 pounds of milk last year and manufactured 4,290,000 pounds of cheese. This makes Tillamook the banner cheese section of Oregon and the Northwest.

Petitions are being circulated by farmers and business men in Phoenix, Mesa, Gilbert and Roosevelt Districts asking the supervisors to support the office of the farm adviser. These have not all reported but in one locality approximately 200 men quickly signed up.

Mr. Leo, a rancher south of Higley, Arizona, secured an exceptionally good yield of wheat on desert land without irrigation by drilling it in rows about 16 to 20 inches apart and cultivating to conserve moisture. He is planning to secure a small tractor to plow and also to pump water.

Higley, Arizona, farmers are preparing to organize a local branch of the farm improvement association to secure better service from the county farm adviser. The adviser spent Saturday, June 19, visiting ranchers and attending a meeting of the Higley board of trade, which is boosting the proposition.

Wickenburg, Arizona, has petitioned through F. B. Jacobs to have a branch of the farm improvement association formed at that place. Fruit trees are being planted in considerable numbers and the ranchers want all the information available to enable them to avoid costly mistakes made in other fruit growing sections.

Seedmen and fruit growers in California have applied to the farm adviser for prices and samples on more than two carloads of sour clover seed. This product which has heretofore been a waste is now bringing \$2.50 per hundred, F. O. B. cars when pure and properly recleaned and local seedmen have offered as much as \$1.00 for the rough seed as it is screened out of wheat and barley by thrashing machines.

The Farmers' Educational and Co-operative Union, Local No. 1, in its regular meeting on May 22, held at Chandler, Arizona, decided to hold one open meeting each month for the purpose of cooperating with the farm adviser of Maricopa County.

ALPHA GAS ENGINES

Do any Work—Use all Oil Fuels

No Batteries
No Coil
No Troubles

A Built-in, Gear
Driven Magneto
As Regular
Equipment

AN ENGINE THAT WILL DO THE work you want it to do; that will operate without being continually adjusted and tinkered with; that will burn any fuel you wish, is one of the greatest conveniences you can have on your farm.

ALPHA ENGINES ENTIRELY measure up to these requirements in every respect. You can always rely on them. They start and run on a simple, low-speed magneto. There are no troublesome batteries to watch or fuss with, or wear out and frequently require renewing. Simply turn on the fuel, give the fly wheel a turn, and the engine is good for a steady all-day run at any kind of work.

Twelve sizes, 2½ to 40 horse-power. Each furnished in stationary, semi-portable or portable style, and with either hopper or tank cooled cylinder.

DE LAVAL DAIRY SUPPLY CO.

EVERYTHING FOR THE DAIRY

Viking Rotary Pumps

Ideal Green Feed Silo

James Sanitary Barn Equipment

SAN FRANCISCO

SEATTLE

ALPHA ENGINES ARE IDEAL FOR farm use, because any one can operate them. Your wife or boy or hired man can use one of these engines without the least trouble, and do easily many small jobs that would otherwise require a lot of time and hard work. Alpha Engines will save you money by doing quickly those time-wasting jobs that ordinarily take you away from field work that is demanding your attention.

ASK FOR THE ALPHA ENGINE catalog. It will give you a lot of valuable information on the many superior and exclusive features of these engines, and will show you how to get more work done in less time and at less cost.

Live Stock and Dairy

MILKING THE COW

EARS of experience on dairy farms and seeing cows milked on many farms in the capacity of dairy tester have afforded a writer in Hoard's Dairyman opportunities for study of the relationship that should exist between the cow and her milker, and the various methods employed by milkers in drawing milk from the cow. From his experience he writes: "My father first taught me to milk as it is done in Holland. I believe there really is but one way to milk, namely, the right way.

"If the milker is seated squarely, in erect posture, on a well-made stool of convenient height (usually 10 to 13 inches) and just far enough from the cow that his arms will be almost fully extended when milking her, and if the cow is standing with her right hind leg set back, then the hands of the milker will be all that comes in contact with the cow during the process of milking. The average farmer should at least clean the litter and dirt off the flank and udder before milking. The milk pail should be held between the knees of the milker and not more than six inches below the teats. Finger nails should be well trimmed. Milking with moist hands is filthy and inexcusable.

"The milk should be drawn by pressure of the full hands encircling the teat. Milking with the full hand is often impossible with heifers and then stripping must be resorted to. The udder should not be swayed or pulled downward but should be held almost motionless. If the arms or wrists of the milker get tired while milking, then resting his elbows on his thighs may be helpful. "The cow that does not kick over the milk pail when her hinder parts are bobbing up and down through the violence and inconsiderateness of the milker has many times more patience than her milker has judgment." The practice of holding the hand on the teat close against the udder tends to develop a teat of uniform thickness throughout. Stripping tends to taper the teat, and sometimes a sort of cushion forms where the teat is attached to the udder, for the lower part of the teat is drawn out in stripping.

"Whenever possible, milk from the fore quarters should be drawn first. Cows that yield most of the milk from the fore quarters are rare. As usually the cow lets down her milk more readily in the rear quarters and yields more milk from these, the tendency often is for the milker to draw this milk first. If this is done, the cow may yield even more milk from the rear quarters and develop a funnel-shaped udder. Drawing milk from a fore quarter on one side and from a rear quarter on the other side is practiced by some milkers. This may be all right if the quarters are begun alternately.

"All the milk that is let down into the teat should be drawn out with each pressure of the hand; if this is not done it may develop a hard milking cow. Try to milk a full stream that causes foam to rise in the pail without hurting the cow. If it hurts her, ease the pressure on her teat. Be especially careful not to hurt the cow if her teat is sore or if her udder is inflamed.

"When milking I like to watch the position of the cow's ears and her facial expression when she turns her head about. A milker should exhibit some of the same patience and affection toward the cow he milks as does the cow toward her calf. There should be harmony between the cow and her milker.

"Experience has taught me that the cow's udder can be milked dry with the full hand and that stripping is unnecessary. A few gentle pressures upward against the milk cistern usually bring down the last drops of milk. This is the method of calves. Every one knows that stripping requires more stripping; then why strip

at all? It is one of the pleasures of dairying to draw a large quantity of milk easily from a well-shaped teat and udder belonging to a well bred cow of good dairy type that is pleased to have one draw the milk from her at the regular hour."

SAN DIEGO COUNTY WILL HAVE

COW TESTING ASSOCIATION
By Farm Adviser H. A. Weinland.

Cow testing associations are becoming the regular thing among progressive dairymen of today. A cow testing association is an association of dairymen for the purpose of hiring a competent tester to determine whether the amount of butter fat produced by their cows is sufficient to warrant their keeping the cows for milk or cream producers and also to enable the dairymen to get better results with various foods, etc.

Cow testing associations are not new, although the first one was formed in Denmark 20 years ago. From that beginning it has spread until in 1909 there were over 1,500 in the European countries. The first association in the United States was organized in Michigan in 1905, 110 associations emanating therefrom by 1909. Many more have been formed since this time, there being at the present time nine in California.

The question often arises whether or not a dairyman cannot do his own testing. He can, of course, as the Babcock test for butter fat is a very simple one and very easily made, but of the many dairymen who own Babcock testers very few actually find time to use them regularly. The association for a nominal cost per cow provides a man who visits each dairy in the association once every month, tests the milk of each cow night and morning for its butterfat content, weighs the milk the cow is giving and estimates the feed she is consuming to furnish that amount of milk. He keeps an accurate record of this for each cow and for each herd, and at the end of the year has a record which will enable any dairyman to know which of his cows should be sent to the butcher and which are the ones whom he should save for calves.

The tester also makes test of the cream, tests the skim milk in order to determine whether the separator is working well and in many ways is in position to advise the dairymen as to methods of handling his dairy cattle in order to produce larger returns.

Where the testing association has been conducted for some time the results of the increase in returns is very striking; for example, in a dairy herd in Sweden an increase of over 4,000 pounds of milk in the average yield per cow was made as a result of the association's ten years of existence. The butter-fat average yield per cow increased 176 pounds per year; the cost of producing 100 pounds of milk was reduced 16 cents and cost of producing a pound of butter seven cents as a result of better feeding methods instigated by the work of the association.

The formation of an association was commenced in San Diego County, with meetings held by the farm adviser in San Pasqual, Ramona and Lakeside June 8, 9 and 10, at which meetings Prof. True of the animal husbandry division of the University of California was present. About 400 cows were signed up at the meetings and membership agreements were left with Mr. Herbert Judson of San Pasqual, Mr. Henry Baldwin of Ramona and Mr. William Miller of Lakeside, for the convenience of dairymen in each of the sections who were unable to attend the meeting. The tentative membership agreement can be signed by calling on the persons above mentioned or by indicating a desire to the farm adviser.

Six hundred cows are necessary to form an association. The price to begin with will be \$1.50 per cow per year, but as a tester can handle upwards of 1,000 cows, if more are obtained the price can be lowered by the

SILOS

BUILT FOR YOUR PARTICULAR NEEDS. EXACTLY AS YOU WANT THEM. ALL SIZES AND DIMENSIONS.

16x36 REDWOOD STAVE SILO MANUFACTURED BY US FOR THE PANAMA-PACIFIC INTERNATIONAL EXPOSITION, SAN FRANCISCO, 1915

TANKS

Perkins, Sacramento Co., Cal.

tor and we were given the name of the Huston Farms Company of Yolo County as a concern which had made extended experiments in ensilage for hogs. We wrote the company and from its manager, Mr. Pike, have the following:

"We are exclusively in the hog-raising business and everything we raise on our acreage is for the purpose of feeding the hogs. Ensilage was with us as a hog ration an experiment, but as it developed it was a most successful one from every standpoint. We constructed two 150-ton silos. These were filled with milo silage, which was used exclusively in conjunction with ground barley for the feeding of our farrowing and litter lot sows. We also used it quite extensively for the feeding of our weanlings, and it was simply astonishing the way this food was relished and the amount that would be consumed, particularly by the small and weanling pigs. Our findings were that it was a great milk producer for farrowing sows, and so well were we pleased with the results that we contemplate constructing two additional silos this fall, which we propose filling with kaffir corn ensilage. We feed about nine pounds each to the sows in the farrowing pens, and in our litter lots, where we keep the sows with their litters after leaving the farrowing pens (which lots have enclosures that permit the little pigs to eat by themselves), we figure on one pound per small pig per day. In these litter lots we feed on platforms, and this quantity, nine pounds to the sow and one pound for each little pig, is cleaned up every evening.

COTTON-SEED MEAL FOR HORSES

In answer to the inquiry "Is cottonseed meal good feed for horses?" Professor Foster of the New Mexico experiment station states that it is when fed in small quantities in combination with other concentrates. A number of southern experiment stations and horse owners report satisfactory results from feeding it to mares, colts, and driving horses at the rate of one pound per head daily, mixed with ground corn or other grain, and to work horses at the rate of two pounds per head daily, fed in the same manner.

The Iowa station found that when fed in connection with corn and oats, 1.1 pounds of cottonseed meal was equal to 1.4 pounds of linseed oil meal in maintaining the weight of the horses and enabling them to work; and that on account of its being less laxative than the oil meal it is better adapted to the needs of horses at hard work. Because of its high protein content and its peculiar flavor it gives most satisfactory results and is eaten with greater relish when fed in a mixture with some of the grains, such as corn, oats, milo or barley. In localities where alfalfa is the principal roughage, cottonseed meal is not needed to properly balance the ration for farm horses. Any of the grains mentioned are sufficient. Its value is more apparent where farmers must rely mainly on timothy or prairie hay or some of the coarse fodders for roughage.

A FEW THINGS TO DO TO BETTER LIVESTOCK

Treat cows gently and avoid excitement.

Be regular in time of milking.
Keep stables clean, well lighted and ventilated.

Weigh the milk of each cow at milking time.

Get your neighbor to share with you in owning a Babcock milk tester, and test the product of each cow.

Discard the animals which have failed at the end of the year to pay for their keep.

Breed your cows to a pure-bred, registered dairy bull from a family having large and profitable production of butter fat.

Raise well the heifer calves from cows which for one or more generations have made large and profitable productions of milk and butter fat.

Breed heifers to drop their first calves at 24 to 30 months of age. Give cows six or eight weeks' rest between lactation periods.

Join a dairy cattle breeders association. It will help you keep posted and in touch with the best and most modern ways of managing your dairy herd.
—George C. Humphrey, College of Agriculture, University of Wisconsin.

DEHORNING CALVES

Those who have had the experience of dehorning a bunch of cattle know that it is not a simple task. Furthermore, it involves more or less cruelty, saying nothing of the danger of losing an animal occasionally and the shrinkage that frequently accompanies the operation. It is much better to do the dehorning, as it were, be

fore there are any horns to take off. It involves a simple operation on calves when they are a few days old. At that time it causes but little discomfort, with absolutely no danger whatever of loss or accompanying shrinkage.

Any stockman can perform the simple operation. It is done by the use of caustic potash, which may be purchased in small sticks. Wet the end

You need a new DE LAVAL SEPARATOR NOW

1st If you are still using some gravity or setting process of creaming —

BECAUSE YOUR WASTE IS greatest and quality of product poorest in mid-summer when the milk supply is heaviest.

BECAUSE TIME IS OF GREAT-est value on the farm at this season and the time and labor saving of the good separator counts for most.

BECAUSE THE SKIM-MILK IS poorest without a separator in hot weather and often more harmful than helpful to calves.

BECAUSE THE WORK OF AN improved De Laval Cream Separator is as perfect and its product as superior with one kind of weather as with another.

2nd If you have a very old De Laval or an inferior separator of any kind —

BECAUSE THE LOSSES OF THE poor separator from incomplete skimming and the tainted product of the hard-to-clean and insanitary separator are greatest at this season.

BECAUSE OF THE GREAT economy of time at this season in having a separator of ample capacity to do the work so much more quickly.

BECAUSE AN IMPROVED DE Laval is so much simpler and more

easily handled and cared for than any other, and you cannot afford to waste time these busy days "fussing" with a machine that ought to have been thrown on the junk-pile long ago.

BECAUSE THE DE LAVAL Separator of to-day is just as superior to other separators as the best of other separators to gravity setting, and every feature of De Laval superiority counts for most during the hot summer months.

These are all facts every De Laval local agent is glad of the opportunity to prove to any prospective buyer. If you don't know the nearest De Laval agency simply write the nearest main office, as below.

California's Largest Manufacturers of Harness, Collars, Saddles.

of one of these sticks and rub it over the miniature horn after clipping the hair away from that region. Rub it until the skin is red. The potash may have to be wet several times in order to get the skin over the horn considerably inflamed. A little care must be taken to prevent burning the fingers but this result may be avoided by wrapping that part of the potash stick that comes in contact with the fingers with paper or cloth. Care

should be taken not to use water enough so that it will run down the forehead or cheek of the animal because in that case it will remove the hair. If the work is properly done a small scab will form on top of the horn and when this comes off it will mean the death of the horn itself.—Wisconsin Farmer.

Chandler, Arizona, is making efforts to secure a sugar milk factory.

Avoid the Dangers of Stall Feeding

GILBERT HESS, Doctor of Veterinary Science, Doctor of Medicine

I want to warn you in time that stock taken off pasture and put on dry feed are pretty apt to get out of fix, because corn, grain, hay and fodder do not contain the laxatives so abundantly supplied in grass.

Some of your animals are sure to become constipated, others off feed, rough in the hair, with paleness of the eyes, lips and nostrils, or the legs may stock or dropsical swellings of the abdomen appear, or the urine may become yellow and thick; but the common ailment of all is worms.

DR. HESS STOCK TONIC

Makes Stock Healthy. Expels Worms.

Being both a doctor of medicine and a veterinary scientist, I formulated Dr. Hess Stock Tonic to correct these evils. It contains a laxative substitute for grass, diuretics to remove dropsical swellings, tonics to improve the appetite and increase digestion and vermifuges to expel worms.

Right now is the time to feed Dr. Hess Stock Tonic, because it's the cow in the pink of condition that fills the milk pail, the steer with an appetite that lays on fat, the horse that digests its dinner that pulls on the bit.

So sure am I that Dr. Hess Stock Tonic will put your animals in a thriving condition, make the ailing ones healthy and expel the worms, that I have authorized your nearest dealer to supply you with enough for your stock, and if it does not do what I claim, return the empty packages and get your money back.

Dr. Hess Stock Tonic is never sold by peddlers—only reliable dealers; I save you peddler's salary and expenses, as these prices prove: West of Rockies: 25-lb. pail \$2.25; 100-lb. sack \$7.00. Smaller packages in proportion.

Send for my book that tells all about Dr. Hess Stock Tonic—it's free.

ANOTHER SALE OF HOLSTEINS

Mr. J. W. McAllister, Jr., who recently managed the successful Schumacher sale of Holsteins at Los Angeles, announces that there will be another great sale of Holsteins held at Sacramento this fall with some magnificent stock offered, much of it from the McAllister ranch at Chino. He writes:

"We expect to have over 70 females in the sale, a large number of whom will be bred to Tilly Alcartra Son. It will be remembered that the success of the Los Angeles sale which established a new average record for the West of \$414 per head was due to the fact that there were 24 females in calf to this bull. Although from \$400 to \$750 apiece was offered for the heifer calves sired by this bull, the options were exercised on but four. Tilly Alcartra Son is growing more and more in popularity every day and there have been as many as 50 head belonging to outside parties on the ranch at one time left to be bred to this bull."

Mr. McAllister states that there is apparently an increasing interest in California in the blacks and whites. The supply of Holsteins is not in any measure equal to the demand. Referring to sales recently made he says:

"One of these recent sales was the splendidly bred young bull, King Segis De Kol Mead, to the Whittier state school. We were very much gratified at this sale as it was the second herd header we had sold the state school in the past six months, and it was sold in competition with a number of bulls from some of the best herds in California and in the East. The dam of King Segis De Kol Mead has won grand championship at the California state fair and is one of the most noted show cows of the breed. She has three daughters with large yearly records, one of which has already broken two world's records. King Segis De Kol Mead will have a splendid opportunity in the Whittier state school herd and we expect to hear a great deal of his daughters when they come fresh."

KEEP THE SEPARATOR CLEAN

After six months' use the cream separator may still look clean and bright on the outside, but that does not always signify that it is all right inside. The gummy substance that is sure to accumulate around the gearing and bearings causes many a separator to be cast aside prematurely. If the owner would clean it thoroughly, readjust the bearings, and replace with new parts the small pieces which show most wear, the life time of many a separator would be doubled and the draft would be greatly diminished. The separators of today are simple enough so that the average farmer can take them apart and assemble without trouble.—Oklahoma Farmer.

Veterinary Queries

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Lung Worms

My cows and calves appear to have good health, eat heartily, give the usual amount of milk, but they have a cough. They are in wild pasture and have running water. What is the trouble, and is there danger of horses in the same pasture being affected?—Subscriber, Santa Clara.

The trouble is probably due to lung worms, verminous bronchitis. They get into the lungs from the grass on wet pastures. In warm weather the cattle go to the low lands for fresh grass and that is the time they seem to get them. The full history of the worm is not known, but when it is once in a pasture it is likely to bother the cattle every summer. If

the worms are not gotten out of the lungs, in time they will cause a discharge from the nose and you may be able to find some of the worms in the mucus. They are small, thread-like worms and sometimes grow to be two or three inches long. Turpentine seems to be the only medicine that will destroy them. For the cows, give two ounces of turpentine in a pint of sweet milk once a day. For the calves give half or one-fourth the amount, according to age. A better and quicker way to reach the worms is to use an hypodermic syringe and inject the turpentine clear. Inject a teaspoon of the turpentine directly into the wind-pipe by passing the needle of the syringe through the skin and between the rings of the wind-pipe. Hold the animal's head up for a moment until the turpentine runs down into the lungs. Two or three treatments of this kind will cure almost any case.

Mange

Mares and colts have skin trouble which causes intense itching. The horses will scratch against anything and bite themselves. The trouble is not so serious in cold weather.—Subscriber, Blythe.

The trouble is probably mange, which is due to a small mite in the skin. Wet the horses all over with a solution of zenoleum. Make the solution by adding a teacup of the zenoleum to two gallons of warm water. Rub it well into the hair and be sure to wet all parts. Repeat this once a week until four or five applications have been made.

Bloat

My cows bloat badly. Am feeding alfalfa hay, occasionally alfalfa meal and some barley. The cow gives four and a half gallons of milk.—Subscriber, Reedley.

Probably some of the alfalfa hay has rolled into a large ball in the first stomach, the rumen, and will not pass on, causing indigestion. Every time fresh food is taken fermentation starts and gas is formed. To empty the stomach of the mass, first reduce the feed. Feed no grain and only give dry hay that will require a great deal of chewing. Get the following medicines and give as directed: Raw linseed oil three quarts, turpentine 10 ounces and aloin three ounces. Mix, shake well and divide into five doses. Give one dose every three or four days. It may take some time to work the mass out of the stomach. Stirring up the contents of the stomach once or twice a day by pressing into the left side with the fists will help to break up the mass and hasten its moving out.

TEN SUGGESTIONS

Provide plenty of clean, dry nests for your hens.

Gather the eggs daily in cool weather and twice a day in hot or rainy weather.

Do not wash eggs. Use the dirty and small eggs at home.

Keep eggs in a cool, dry place, which is free from odors.

Don't sell eggs which have been in an incubator.

Market your eggs daily, if possible; if not, every other day.

Don't sell eggs which were found in a stolen nest. Use them at home.

Keep the eggs out of the sun when taking them to town.

Don't keep eggs near oil, onions, etc., as they readily absorb odors.

Kill or sell all roosters as soon as the hatching season is over.

Poultry for Profit

INFERTILE EGGS

IT is conservatively estimated that there is an annual loss in eggs in this country of \$45,000,000. Practically all of this enormous loss is sustained by the farmers of this country, as it is on the general farms that the great bulk of eggs is produced. A very great part of this loss can be prevented by the production of infertile eggs which are laid by hens that do not have a male bird with them. The male bird has no influence whatever on the number of eggs laid. Therefore as soon as the hatching season is over the male should be removed from the flock.

The greatest trouble from blood rings in eggs occurs in hot weather. Special care should be given to the gathering and storing of the eggs during the late spring and summer months. At these times the eggs should be gathered at least twice a day, placed in a room or cellar where the temperature does not rise above 70 degrees Fahrenheit, and marketed two or three times a week.

Blood rings are caused by the development of the embryo of a fertile egg and its subsequent death. It is impossible to hatch an infertile egg or cause a blood ring to form in one. It is generally considered that eggs become infertile from seven to 14 days after the male bird is removed from the flock. Repeated experiments have shown that where fertile and infertile eggs are kept under similar conditions, the fertile eggs spoil much quicker, due to the fact that they deteriorate faster than infertile eggs in the average summer temperature. Summer heat has the same effect as the hen or incubator on fertile eggs. Sell, kill, or confine the male bird as soon as the hatching season is over.

A COMMON CAUSE OF CHICK LOSSES

That many poultrymen are mistaking a disease known as aspergillosis for bacillary white diarrhea is the belief of Helen Dow Whitaker, head of the poultry division of the state college of Washington. The confusion more readily results because fowls affected with either disease show diarrhea accompanied by a whitish discharge. In both cases affected birds mope about with drooping wings, are very weak and wish to drink constantly. Aspergillosis, or brooder pneumonia, as the disease is called when it affects very young chicks, is a disease of the respiratory system caused by a fungous growth which develops in the membranes of the nostrils, mouth and throat, finally affecting the lungs. It may in time extend to the digestive system, producing whitish or yellowish nodules in the tissues of the liver and even the intestines. Sometimes these spots are flat and slightly greenish in color, due to the growth of the mold on the surface of the diseased area. From the beginning the breathing of the bird is rapid and difficult. Death results from exhaustion or suffocation.

The disease is caused by eating musty or moldy food. The spores are most often found in the straw litter or chaff that the baby chicks are given to scratch in on the floors of their brooder, or in decaying vegetation, or in spoiled corn or corn meal. If there is an old straw or manure pile, or a rubbish heap to which fowls have access, the disease is likely to develop and one bird will transmit it to another. It is a disease difficult to cure and it hardly pays to try, especially in the case of brooder chicks which are so weakened that if they survive they seldom develop into anything but runts. The remedy that is generally used is to stir two tablespoons of wood tar into a quart of warm water. Let the mixture stand a few hours, then put the affected fowls into a closed box or room where the tar water is dropped upon a heated brick or stone, thus making a vapor which

the birds inhale. Care should be used not to smother the birds. It is also helpful to apply flowers of sulphur or tincture of iodine to the diseased passages in the mouth and throat. In all cases it is much better to burn than to bury the bodies of fowls that die with aspergillosis.

Since little can be done in successfully treating affected fowls, the purpose of this discussion is to warn poultrymen against packing eggs for hatching in moldy or damp material, against using incubators or brooders that have been stored where they might gather dampness during the winter without first thoroughly disinfecting them, and above all, against permitting fowls, young or old, access to any moldy litter, decayed vegetation, rubbish heaps, manure piles where the spores of the fungous that cause this disease may be found by them.

BACILLARY WHITE DIARRHEA OF CHICKS.

Bacillary white diarrhea of chicks is an infectious disease. It may be inherited from the parent stock or contracted by healthy chicks if brooded with affected chicks. The following statement concerning this disease is made by Helen Dow Whitaker, head of the poultry department of the state college of Washington, who believes that it is of vital importance that poultrymen throughout the West should learn to recognize this disease and stamp it out lest it become the dread scourge of Western flocks that it has of many in the East.

Chicks are most susceptible to the disease during the first two days after hatching, and most of the deaths occur under one month of age. The first symptoms are a tendency to huddle and to sleep. The chicks are listless, make very indifferent efforts to pick up food, their wings droop, and sometimes they show a decided thirst. The diarrhea may not appear for a day or two after the chicks show the other symptoms. The secretion is usually white but may be streaked with brown and generally is sticky enough to paste up the vent. There is no generally accepted cure for bacillary white diarrhea. All the buttermilk or sour milk that the chicks will drink from the second day on is the best preventive, together with proper care of the chicks and healthy breeding stock.

Any poultryman can determine quite accurately whether or not his mature stock is or has been infected with bacillary white diarrhea. Whenever hens are killed examination should be made of the ovaries. The ovary of a laying hen in shape resembles a bunch of grapes with a more or less completely developed ova or yolks attached like grapes to a common stock. In a healthy hen the undeveloped ova are similar to tapioca grains that have been soaked in water until they are transparent, except that they vary in size, some being as small as a pin point. The color of the developing ova varies from a light yellow to the color of the normal yolk. In a typical white diarrhea ovary the ova are usually more or less mottled so that almost all shades of yellow and brown may be seen. The contents of these discolored ova is a cheesy matter permeated by a clear amber colored fluid. Furthermore, the diseased ova are flattened or angular on the surface, while the normal ova appear round.

Poultrymen cannot be too careful in preventing the spread of this disease. The bodies of all infected birds should be immediately burned, not buried. It should be remembered that a pullet once infected and apparently entirely recovered will nevertheless transmit the disease to her chicks and it is the utmost folly to attempt to breed from infected birds. An infected bird in the laying pen is a constant source of danger since the germs may

cling to the shells of the eggs she lays, infest the droppings and hence the ground upon which she ranges.

FIFTH MISSOURI NATIONAL EGG-LAYING CONTEST

The state experiment station at Mountain Grove, Missouri, is sending announcement of its fifth national egg-laying contest. The test will begin November 1, 1915, and continue for 12 months. In the opening of this book, which contains rules and regulations of the contest, we note:

"These egg-laying contests have marked a new epoch in the history of the poultry industry. Before the egg-laying contests started poultry was bred largely in a haphazard manner so far as egg production was concerned, but today the breeders have adopted better methods, and by the use of the trap nests they are able to know definitely the pedigree of the chickens they raise. By knowing this they can select and breed both males and females from the hens which make the highest records.

"The breeders who enter pens in this egg-laying contest have an opportunity to raise chickens from their own hens which have officially certified records. This gives them a foundation to breed from which could not be secured in any other way."

The prizes are not large, \$50 in cash with a silver loving cup being the reward for the highest record for the 12 months' work of five pure bred pullets. However, in addition there are monthly premiums and other rewards which aid in carrying the expenses of the successful contestant.

HATCHING GUINEAS

Young guineas sometimes appear to be deformed when first hatched, and as a rule the apparent deformity is simply the result of a slow hatch. When chicken hens or incubators are used, it is an easy matter to give the eggs proper attention. Guineaes resent intrusion, especially while setting. This alone would be sufficient reason for hatching with chicken hens, or with incubators, although there is still another reason not given. Guinea hens if not controlled will drag the young guineas around through the grass in all kinds of weather, and the result can easily be imagined. Of course, young guineas need exercise, but they are very tender at first and should be kept out of wet grass or rain. They are far less apt to take gapes if kept dry. It is the same with chicks and turkeys. We have houses, not coops, for all the young poultry, and find that keeping the floors clean and dry is as important as keeping everything free of vermin. However, we are convinced that lice kill more young poultry than all the other causes combined.

During the first few days after guineas are hatched they have to be fed quite frequently. We feed a little every two hours. Dry bread, finely crumbled with a little chopped "greens," such as lettuce or onions, will always give good results. A little coarse sand is sprinkled over the feed at first, but this is not necessary after they have learned to eat grit whenever required. However, sharp sand and other grit should always be provided. Boiled eggs are not suitable food for young guineas, as they are almost sure to cause constipation. After they are a few days old they will eat oatmeal dry, or cornbread. A varied ration is better than any one feed. When they are a few weeks old they will eat cracked corn, whole wheat or whatever chicks will eat. When they are a month old they should not be fed more than three or four times a day, and if they have good range, a very little feed each time will be sufficient. In fact, they could get along on two feeds a day, but we like to teach them to come home for feed. They are great foragers, and if there are any grain fields near, they will make regular trips to pick up what they can find among the stubble. Guineaes, both old and young, are good bug-catchers and they will not injure garden crops as chickens are apt to do, because they rarely scratch unless grain is thrown among litter.—Poultry Tribune.

A DEFINITION

A smile: the lighting system of the face and the heating system of the heart.—April Woman's Home Companion.

A DOG STORY

We brought from Scotland a collie about six months old. He was allowed to be with us at the breakfast table, but never to be fed in the dining room. This rule was enforced by my daughter. I was the only member of the family who ever broke over the rule. And often when I offered him a tempting bone he would glance across the table and if he caught the forbidding eye he would resist the temptation. But one morning she left the table abruptly. Rab followed her into the hall and watched her till she had closed the door of her study. Then he scampered back, nudged my elbow, as if to say, "Now is our time," seized the bone and was soon crunching it with the greatest satisfaction.—London Spectator.

DIVIDEND NOTICE

The German Savings and Loan Society (The German Bank)

526 California St., San Francisco

For the half-year ending June 30, 1915, a dividend has been declared at the rate of four (4) per cent per annum on all deposits, payable on and after Thursday, July 1, 1915. Dividends not called for are added to the deposit account and earn dividends from July 1, 1915.

GEORGE TOURNY, Manager.

Irrigators

Who are Interested in Lifting Water from Deep Wells Should WRITE for This BOOK

It contains valuable information about irrigation and the World's best pump.

For deep lifts as well as shallow lifts combined with high heads above surface and through long pipe lines. No auxiliary pump needed for forcing water above the surface.

8-ft. mills, \$19.50; 10-ft. \$27.50; 12-ft. \$45. H. P. BALER, \$90; SOUTHWICK power baler, \$350, cost over \$700; WHITMAN power baler, \$200. Steam tractor with complete baling outfit, \$600.

Mowers, Rakes, Sprayer, harrows, potato, beet machinery, Fan Mill, Corn Sheller, small ranch tools.

ENGINES, PUMPS, BOILERS
Eighty H. Boiler, Smith Valle Steam engine 14x18 and Compressor 12x18, \$1000, cost \$6000. Absolutely cheapest serviceable material can be produced for. Pioneers in our line. **DEMMITT CO., UP-STAIRS, 120 N. Main, Los Angeles, Yard, 816 Yale.** Buy Tools of All Kinds.

For Sale—Used and new Gas Engines, 2 H. P. up, rebuilt and fitted with modern equipment. 22 years' experience enables us to repair and rebuild Gas Engines correctly. Get prices. Lloyd, 806-808 N. Main St., Los Angeles. F7020—Broadway 4103.

For Sale—One 15 H. P. Western gas engine in good condition with fuel tank, all necessary pipe and fittings, batteries, etc. Also one Gould and one Price No. 4 horizontal centrifugal pumps. Cheap. **Hugh T. Thomson, Orange, Cal.**

SEEDS AND PLANTS

For Cattle, Hog and Poultry Forage plant now Luther Burbank & Mediterranean Spineless Cactus. **ROBINSON CITRUS NURSERIES, R. F. D. 35-A, San Dimas, Cal.**

Burbank Spineless Cactus—Hardest varieties, "Melrose" and "Special." Strong, matured slabs. \$8.50 per 100; \$50 per 1,000. Labranza Ranch, Athlone, Merced Co., Cal.

Genuine Burbank Spineless Cactus—Strong mature slabs, \$8 per 100—\$50 per 1,000. Thos. Cathers, Morgan Hill, Cal.

FARM LANDS FOR SALE

For Sale—A highly improved dairy ranch in the celebrated Modesto irrigating district, located on the State highway, one mile from R. R. Station, 15 to 20 minutes walk from electric car running every hour, daily free mail, telephone. New, modern 2 story 10 room house, large barn, well, windmill and large storage tank. Private pumping plant costing \$2500.00. Can sell water to neighbors. 35 acres in good stand alfalfa, family orchard, all kinds berries, vegetable garden, 22 cows, 8 heifers, 1 bull, 3 horses, all farm tools to handle this first-class income property. \$15,000.00 cash, \$7000.00 to suit buyer. For more information, write L. O. Johnson, Modesto, Calif.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. **Geo. W. Sill & Co., Watsonville, Cal.**

For Sale—You can own your own 10-acre ranch and home with water for \$750.00, \$150.00 cash and \$150.00 a year; 7 per cent interest, in Fruitland Colony Lands. F2467. 1005 S. Main St., Los Angeles, Cal.

I have some cash buyers for salable farms and ranches, owners only, write C. C. Buckingham, Houston, Texas.

For Sale—On reasonable terms, 40 acres young orchard. Implements, Buildings, everything complete. G. C., 1015 I St., Fresno.

5 Acres Improved Ranch near San Diego, value \$4500.00; to trade for ranch in Orange County. Submit your offer to E. J. Zeller, Nestor, Cal.

MISCELLANEOUS

Free for Six Months—My special offer to introduce my magazine "INVESTING FOR PROFIT." It is worth \$10 a copy to anyone who has been getting poorer while the rich, richer. It demonstrates the REAL earning power of money, and shows how anyone, no matter how poor, CAN acquire riches. **INVESTING FOR PROFIT** is the only progressive financial journal published. It shows how \$100 grows to \$2200. Write NOW and I'll send it six months free. H. L. Barber, 430, 28 W. Jackson Blvd., Chicago.

Walnut Budding—I have originated the only successful method of budding walnuts. Full particulars and natural cut mailed on receipt of \$1.00. W. A. Barnett, Vacaville, Cal.

Living Expenses Reduced Through Co-operative Buying—Open to all. Write for catalog and particulars. Pacific Co-operative League, Dept. C, 236 Commercial St., San Francisco.

"Smith's Pay the Freight"—To reduce the high cost of living, send for our Wholesale to Consumer Catalogue. **Smith's Cash Store, 112 Clay St., San Francisco.**

POULTRY

Just Out—The Cultivator Poultry Book. "Poultry for Profit," by Jean A. Koethen. Published by the Cultivator Publishing Co. Highly endorsed by experts. Over 200 pages, 50 illustrations. Contains simple methods of avoiding and overcoming difficulties. A guide to poultry success under Western conditions—it tells what to do, why to do it, and how to do it. Nicely bound in cloth. Price \$1.00 postpaid, or with Cultivator one year, \$1.75. Send orders to Cultivator Publishing Co., 115-117 North Broadway, Los Angeles, Cal.

Baby Chicks—Rhode Island Reds and White Leghorns. My guarantee safe arrival, full count, strong, vigorous; fine bred chicks, Leghorns, \$9.00 per 100. Will lay in five months. Reds, \$11.00 per 100. Will lay in six months. J. W. Lyon, Gardena, Cal.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. **National Poultry Co., 607 E. Third St., Los Angeles, Cal.**

Baby Chicks—Electric Hatched. White and Brown Leghorns, R. I. Reds, Barred Rocks, Black Minorcas and Anconas. Special prices for June and July. **THE ORLAND HATCHERY, ORLAND, GLENN CO., CALIF.**

Barred Plymouth Rocks—"The kind that Lay and Win." Choice stock for sale. Catalog free. C. H. Voden, Los Gatos, Cal.

At Your Service 365 Days in the Year—First-class chicks; eggs for hatching, eight breeds. **Hawkeye Hatchery, Turlock, Cal.**

WANTED

Position Wanted—By experienced dairyman and wife. Capable of taking complete charge of dairy ranch or would like to lease such a ranch. Must be near school. H. J. Bateman, College City, Colusa Co., Cal.

Good Territory open for agents or fertilizer salesmen in California to handle Radio-active-earth (Radium residue) for mixing with fertilizers. A. M. Wells, 633 Van Nuys Building, Los Angeles, Calif.

Wanted—A party that understands dry farming in Mojave Desert. Room 612, 110 Sutter St., San Francisco.

SCHOOLS AND COLLEGES

Wanted—About seventy-five young men and women to enter The WESTERN NORMAL on August 30th, to prepare for teaching. Western Normal graduates secure and hold good positions. We assist graduates to secure good positions and promotion. We save you time and money. For information, address, **WESTERN NORMAL, J. R. Humphreys, Principal, Stockton, Cal. 634 E. Main St.**

Telegraphy—Stenography, bookkeeping, English branches. Positions guaranteed. **Mackay Business College, Los Angeles.**

KODAK FINISHING

Developing, 10c per roll. Printing, 2 1/2 x 3 1/4, 2 1/2 x 4, 3c; 3 1/4 x 4 1/4, 3c; 3 1/4 x 5 1/4, 4c. **Denver Store, 706 S. Hill St., Los Angeles.**

LIVE STOCK

Billiken Herd—Pure bred, pedigreed, O. I. C. swine; the big white kind. Ready for immediate shipment; weaned pigs of both sexes; pairs and trios; mates not akin. All these pigs are from big type stock, of extra heavy bone; weight, with early maturing quality. Immunized against hog cholera; crated and registered free. Write for descriptive circular and price list. C. B. Cunningham, Mills, Sacramento County, California.

Hogs—Forty head of BIG TYPE POLAND CHINA boars of any age. Sired by IOWA WONDER, who is a son of A WONDER, the greatest hog living or dead. No females to sell at present. On account of large number on hand will make special prices. **Geo. A. Smith, Corcoran, Cal.**

Big Money in Milch Goats—But you must learn the business—feeding, care, breeding, diseases. Mistakes costly. Booklet tells how—based on 8 years' experience in U. S., also data from hundreds of others. Send 3 dimes; 1st ed. nearly gone. B. C. Pub. Co., 2939 E. 16th St., Oakland, Cal.

Grape Wild Farm Thoroughbreds—Guernsey Bulls of A. R. B. breeding. **BERKSHIRE HOGS**. Finest herd in the state. All ages for sale. A. B. Humphrey, proprietor. Mayhews, Sacramento Co., California.

Cholera Immune Berkshire Pigs—All ages. Registered Holstein bull. **Prairie Pictette** 107062, three years old—gentle and guaranteed in every way. Selling to avoid inbreeding—\$300.00. **Ricconi Bros., Mountain View.**

For Sale—Registered, Berkshires: 25 choice pigs of best breeding from the best strains in America. For prices and description address **H. L. Murphy, Perkins, Sacramento Co., Cal.**

For Sale—A few O. I. C. boars ten months old, also pigs two and three months old. Registered. Special offer to those who write within three weeks. Address **G. H. DuBois, San Martin, Calif.**

Blatchford's Pig Meal weans pigs easily and safely; no trouble; no milk. Write for free folder, "The Safety Route from Pignood to Porkage." **Coulson Co., Petaluma.**

Milch Goats—Toggenburg Guggisburger yearling does from a very heavy milking family—high grade Saanen buck kids. **Mason & Son, R. 2, Phoenix, Ariz.**

For Sale—At all times, Jacks and Stallions, driving and saddle horses. Price and stock guaranteed. **Phillips and Kingsbury, 2318 G Street, Sacramento.**

Berkshires—Pedigreed Boars ready for service. Bred sows, weanling pigs, both grade and thoroughbred, finest stock. **C. H. Thompson, Novato, Cal.**

Duroc Jersey Swine—Registered boars, no gilts for sale. Guarantee satisfaction. Prices reasonable. **H. P. Eakle, R. F. D. 3, Woodland, Cal.**

For Sale—Bred sows and gilts. All cholera immune and extra choice large stock. **Main 1326—F-6350. Mr. Hill, 429 Union Oil Bldg., Los Angeles, Cal.**

Poland Chinas—Young stock; either sex. Write for pedigree. Reasonable prices. **Edwd. A. Hall, Watsonville, Cal.**

Glenview Poland China—Stock for sale. **Chas. R. Hanna, R. F. D. No. 3, Riverside, Cal.**

Pedigreed Duroc Jersey Boars or sow pigs—Extra fine. **John Kincaid, Box 161, East Bakersfield, Cal.**

For Sale—Thoroughbred Duroc Jersey Boars and Gilts, strong and vigorous stock. **Fred Hart, Exeter, Cal.**

Berkshires—Boar pigs for sale, **Butte City Ranch, Butte City, Glenn Co., California.**

N. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

RABBITS

Leading Rabbitry in America—Flemish Giants a specialty. Prize winning and heavy weight stock. Scored and sold on their merits. Inquiry and inspection solicited. Catalogue on request. **Empire Rabbitry, Empire, Cal.**

Bosworth's Imperial Red New Zealand Hares sold at hard times prices. **NOTHING BETTER.** **Geo. M. Bosworth, Geyersville, Cal.**

Caldwell's Royal Red New Zealand scored and sold on merit. Catalog free. **Caldwell Bros., Box 613R, Los Angeles.**

MUSICAL INSTRUMENTS

Special Piano Offer to country buyers, for a short time only. Any piano or player piano at \$100.00 special discount. Ten different standard makes, styles and finishes to select from. Act quick. Address **GIRARD PIANO COMPANY, 517-519 14th St., Oakland, Cal.** Established 1873.

We repair, buy, sell and exchange musical instruments; used instruments, good as new, sold cheap. Write for bargain list. **Bolander's Fiddle Hospital, 52 Second street, San Francisco.**

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. **The Kruckeberg Press, 237 Franklin St., Los Angeles.**

HER SAD EXPERIENCE

"But why did you leave your last place?" the lady asked the would-be cook.

"To tell the truth, mum, I just couldn't stand the way the master an' the missus used to quarrel, mum."

"Dear me! Do you mean to say that they actually used to quarrel?"

"Yis, mun; all the time. When it wasn't me an' him it was me an' her."

New Books

ESSENTIALS OF AGRICULTURE

"Essentials of Agriculture," by Henry Jackson Waters, president of the Kansas agricultural college, published by Ginn & Company, Boston, at \$1.25. This is a book of nearly 500 pages, well printed and with an illustration on nearly every page. There are 37 chapters with a regular text and many chapters devoted to a valuable appendix. An idea of the scope of the book is given in its table of contents from which we quote titles of a few chapters: "The New Agriculture," "Better Plants and Animals," "How Plants Feed and Grow," "Plant Propagation," "Soil," "Manures and Fertilizers," "Small Grains," "Fiber Crops," "Grasses," "Legumes," "Forage Crops," "Roots," "Silos," "Orchards," "Wood Crop," "Plant Diseases." The first paragraph in Chapter I is quoted from Vergil, and as it touches agriculture as continued in America today we quote it entire:

"Here is a land where no bulls, breathing fire from their nostrils, have plowed the soil; where no enormous dragons' teeth were ever sown; where no human harvest started up, bristling with helmets and crowded lances; but teeming corn and the wine god's Massic juice have made it their own; its tenants are bursting crops and luxuriant herds of cattle. Hence comes the war horse that prances proudly into the battlefield. Hence the white flocks upon a thousand hills. Think, too, of stately cities and trophies of human toil and towns piled by man's hand with great rivers flowing beneath their honored walls. It is a land, too, which has disclosed streams of metal mantling in its veins, a land that has produced mortal tribes of heroic mold. Hail to thee, mighty mother of noble fruits and noble men."

The book is intended as a textbook and it is of a type which is invaluable for the farmer of today.

CONTROL OF CITRUS INSECTS

Prof. H. J. Quayle has for several years been making a study of insects affecting the citrus industry. The result of his investigations is now chronicled in Circular 129, "The Control of Citrus Insects." In his opening paragraph touching upon fumigation he says:

"Fumigation is the most satisfactory treatment for the control of scale insects on citrus trees. The denseness of foliage and compactness of growth of citrus trees make them well suited for a gas treatment within an enclosed tent covering. Most citrus growers are not so directly interested in the details of the fumigation processes because such work has been usually done by contract, by the local Fruit Growers' Exchange, or by an association. However, the growers themselves should understand enough of the essentials of the fumigation work to pass proper judgment on the character of such work. As compared with other necessary operations in the citrus grove, such as cultivating, irrigating, pruning, and fertilizing most growers know the least about fumigating."

The author then refers to the various methods of working out fumigation satisfactorily and also gives extended description of the fumigation machine and the cyanofumer. The bulletin may be had by addressing the Agricultural Experiment Station, College of Agriculture, Berkeley.

THE AVOCADO IN CALIFORNIA

Part I of Bulletin 254 of the agricultural experiment station, Berkeley, "The Avocado in California," is written by Prof. I. J. Condit and treats upon the culture, production and marketing of California avocados. In Part II Prof. M. E. Jaffa discusses the composition and food value of the fruit. The great interest in avocados will doubtless call for wide distribution of this bulletin. It is illustrated with several engravings showing clusters of the fruit, large trees, method of growing trees in nursery, and different types of fruit.

The bulletin may be had by addressing the state experiment station, College of Agriculture, Berkeley.

QUESTIONS AND ANSWERS

(Continued from Page 11)

fall pullets. Moulting time is supposed to come at the end of the first season's laying and fall pullets which begin to lay in the spring are apt to moult late in the fall. I remember mine last year began to moult in December. It would be possible, I suppose, for extra good layers to postpone their moulting till spring, but if you have noticed no feathers on the ground I cannot believe that this is a real moult. Whether or not you sell these hens off ought to depend I think on their age and productivity. If they are two-year-old hens and have stopped laying entirely it would hardly seem worth while to keep many of them. If they are last year's pullets and have done good work I should not be in a hurry to get rid of them. It may be that they will begin laying soon and not go into the regular moult till winter. I have heard that many Leghorns moult twice a year in this warm climate, but mine did not.—J. A. K.

Soaking Barley

Having a request for information regarding feeding value of barley soaked 12 hours as compared with rolled barley, we have asked a stock feeder of the Sacramento Valley regarding his experience in the matter. He writes:

"I do not know of any feeding experiments bearing directly on the question as to whether whole barley soaked 12 hours is as satisfactory a feed for horses and hogs as rolled barley. I have seen both rolled and soaked barley fed to stock on the same job, and if there was any difference as far as could be noted it was in favor of the soaked barley. There is some prejudice against feeding soaked barley to horses and mules, but I can see no reason for it. I would prefer soaked whole barley to rolled barley dry for hogs because I believe they would masticate it better. The whole problem is one of having the grain in the best condition to be acted on by the juices of the alimentary canal, and hard, dry barley is made more easy to chew up and masticate both by grinding and soaking. Most of the barley fed to horses through Central California is rolled, but I have seen a considerable amount soaked and fed with good results. The argument in favor of soaking is that it makes it easier to masticate and less of it passes through the animal whole.—W. S. G."

In addition we wrote Prof. F. W. Woll of the university farm at Davis and he answers:

"The practice of feeding soaked grain to horses and other farm stock was rather common a generation ago, but has now been generally abandoned. Farm animals with sound teeth are abundantly able to grind the dry grains, except in the case of small, hard seeds like barley, rye, millet, sorghum, etc., which had better be rolled or ground to avoid a waste of feed. In chewing the feed it is mixed with saliva in the mouth and the first step in digestion commences; if the feed is fed wet there is less secretion of saliva and no advantage is gained in point of digestibility. It is true that farm animals will eat larger quantities of soaked feed than of dry feed, but this is of importance only in the case of fattening or milk-producing animals that are forced to a maximum production and when the cost of feed is a minor consideration.

"The fact that soaking feed for farm stock is no longer practiced, except for swine in some cases, shows that the method is of no value as a general proposition. This applies with still greater force to cooking feed for farm animals; an occasional allowance of cooked or warm feed may be of value for regulating the bowels or for its tonic effect, but healthy stock with good teeth need no such special attention and will not give adequate returns for it."

Almonds Not Growing

This spring I planted seven almond trees of different varieties and at this writing, June 5, none have grown, except to put out the first leaves from bud. Trees were planted the latter part of February and there they stand on well tilled decomposed granite soil, with a dry, withery look. Trees were grown at Hemet. At time of planting I cut back to about 18 to 24 inches, according to size. As I remember, the

trees had fairly good roots and healthy looking tops and were of fair size. Other trees, such as peaches, planted beside the almonds and at the same time, are growing beautifully. I would like to know why the almonds have failed to grow. Would it do any good to cut back at this time to say 12 or 15 inches? Ground is in fine condition. They have not been irrigated, excepting a couple of trees that water was carried to.—Subscriber.

There is evidently something the matter with the roots of your almond trees. You will no doubt find that they have failed to throw out rootlets. Trees with a single tap root usually act that way and when the roots are heavy and thick with no fibers. They will sometimes stand all summer and not start. This is why most growers prefer a medium-sized tree. Cutting back will not start the roots. The best thing for you to do is to start again next season and plant June buds. They will outgrow the trees you now have even if they do start growing.—J. W. M.

Mildew on Beans.

A subscriber recently inquired as to cultivating beans when moisture is on the plants. He had been warned not to do so because of the practice encouraging the spread of mildew. The matter was referred to Mr. G. W. Hendry, who answers:

"Mildew on beans in California is generally due to the fungus scientifically known as *Erysiphe polygoni*. The idea of the subscriber that the disease is apt to occasion greater losses when cultivation is given while the vines are wet is quite correct because the spores of the fungus may be carried from plant to plant by the moisture adhering to horses and implements. The best means of controlling mildew on beans is to spray with flowers of sulphur, preferably early in the morning while the dew is still on the vines. If the sulphur is to be applied during the day it should be put on in liquid form in order that it may adhere to the foliage. In spraying with dry sulphur the flowers of sulphur is preferable to any of the ground forms of sulphur, but when spraying with the liquid spray, where the material is cooked before application, coarser forms of sulphur may be used with good success. This has been an exceptional season because of the late spring rains, and the mildew, especially in the fog zone of the coastal sections, has been unusually prevalent."

Moles and Rabbits

How can I catch moles, and what is the best poison for rabbits?—Subscriber, Upland.

The best method of controlling moles is to use the ordinary mole trap. This is a double trap, the trigger of which is arranged to come over the runway of the mole, which has been pressed down with the foot. The jaws of the trap are pressed into the ground on both sides of the portion of the runway which is closed. When the mole comes through the runway he springs the trap, and no matter which way he is coming from the trap gets him. The type of trap with spears forced down into the ground is not so effective. Perhaps the best poison for rabbits is strychnine placed under the skin of fresh fruit, or a solution of arsenate of lead, three pounds to 50 gallons of water, may be made and wisps of fresh alfalfa dipped into it and left about the rabbits' runway. These wisps should not be left where they will be accessible to stock.

Lime-Gypsum

Kindly advise if gypsum will take the place of air-slaked lime for changing mechanical condition of soil? Have some land that bakes badly and is always lumpy. Air-slaked lime seems to correct the trouble but as gypsum is cheaper would prefer to use it if it will accomplish the same result.—Subscriber, National City.

Gypsum does not have the power of flocculating or "lightening" the soil as does lime. Gypsum is excellent for holding moisture, making available the potash in the soil, and there would be no harm in its use. In addition to application of lime would suggest the liberal application of coarse, strawy manure or even weeds or wild grass, well worked into the soil.

Potato Seed

Will Early Rose potatoes from this spring's crop answer for seed for the fall planting?—Subscriber, Newhall.

Yes, ripen as well as possible, spread in the light where they may be greened for a few days and they will usually start all right. See Mr. Guilford's article in this issue.

Weaning Kid

Having request for information as to best age to wean kid we have asked Mr. Winthrop Howland of Redlands to give information along this line. He writes: "For best results a doe kid should not be fully weaned until about five months of age. During the first month a kid should be nursed five times daily, as frequent nursings with but little at a time are best for very young kids. After a kid is two months old three times daily is sufficient. When they are three months old they may be fed alfalfa and a very little grain, about a tablespoon daily at first, gradually increased. By gradually increasing the amount of alfalfa and grain until the kid is five months old she should be in fine condition and fully weaned. If a kid is stunted through lack of feeding she can never be made to attain normal size, no matter how well fed and cared for. The first few months are the critical ones for making growth in a doe, and frequent and moderate feeding is the proper rule."

Shothole Borer

A subscriber has brought to the office a small portion of bark from an apple tree which is filled with numberless small holes a little larger than a pin. Some of the trees in the orchard are dying. All seem to be affected. The matter was referred to Prof. E. O. Essig, in charge of the university insectary, and he reports that this work is done by a beetle, "one of the ambrosia beetles commonly called the lesser shothole borer, *Xyleborus xylographus*." Referring to *Injurious and Beneficial Insects of California*, on page 314 we find a description of this pest with its life history and the nature of its work. Its food plants include many of our fruit trees. Regarding the control of this pest Mr. Essig in his book recommends:

"Keeping the trees as healthy as possible and inspecting nursery stock to prevent introduction are the most important considerations with regard to this beetle. If infestation does occur, all trees which are badly attacked should be removed and burned and the others carefully pruned to remove all the infested parts possible. The application of a coat of carbolated whitewash (one pint of 25 per cent crude carbolic acid to ten gallons of whitewash) is recommended. Prof. E. D. Sanderson also recommends the use of a thick soap wash containing a pint of crude carbolic acid to every ten gallons, and quotes Prof. Gossard as having attained good results by applying early in spring, midsummer and October a whitewash to which is added a small amount of table salt or Portland cement to make it stick. Prof. Gossard is also given as the authority for having obtained good results in killing the larvae within their burrows by the application of a spray made by dissolving three pounds of naphtha soap in three gallons of hot water and adding one gallon of carbolineum. This is thoroughly agitated while still hot and diluted one to four of water for use."

Water Glass for Eggs

A friend tells me that in using water glass for preserving eggs she boils and cools the water, then simply pours the water glass on top of it. Mrs. Koethen's book, as quoted in the *Cultivator*, refers to boiling the water, then cooling and thoroughly mixing. Which is correct?—Subscriber, Porterville.

The water glass must be mixed with the water somehow for if it does not reach the pores of every egg and seal them up there will be decay. Just how the mixing is done, however, is a matter of no consequence. Very likely, since water glass is heavier than water, it will settle through it if it is merely poured on top and will thus mix itself.—J. A. K.

Meet your Business Face to Face

The Cultivator
Poultry Book
Poultry for Profit
BY
Jean A. Koethen
Graduate of University of Calif.

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

Where is there a thoroughly successful business person, who did not first go over carefully all the ins and outs of his future business. The poultry business is your future business; meet it face to face with all its ups and downs explained thoroughly in the book "Poultry for Profit."

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on eggshell book, binding full cloth vellum de luxe, at the price of one dollar postpaid.

Order your copy NOW.
Equip yourself mentally FIRST.

HOT WEATHER DAINTIES

A Delicious Ice Cream Easily Prepared

This is the time of year when cooling foods and drinks take precedence over all others. The making of a good ice cream should be one of the accomplishments of every efficient housekeeper. A recipe in much favor in all parts of the country calls for: One cup sugar, $\frac{1}{2}$ teaspoon salt, one tablespoon cornstarch, one pint milk, yolks of three eggs, one pint cream. Mix the cornstarch with the sugar and add to the slightly beaten eggs. Pour on the milk slowly, add the salt and cook over water until thoroughly done. When cold, add the cream and freeze, flavoring to taste.

In order to insure the best results with the above recipe it is important that a good quality of cornstarch be used, as an inferior cornstarch will mar the entire dish.

Housekeepers everywhere who have the best success with cornstarch recipes always depend upon the famous Kingsford's brand, which can be obtained at all modern grocers. To guard against disappointment, use Kingsford's wherever cornstarch is required. Ordinary cornstarch cannot be depended upon for the results you desire. In ordering Kingsford's, ask your grocer for the little Kingsford's Cook Book which contains the above and many other valuable recipes and culinary hints.

SODA IN BAKING

First Prize Article

By M. Louise Berneike, Santa Ana.

THE difficulty in using soda with sour milk or buttermilk arises from the fact that the amount of acid in these substances is a variable quantity, varying with the length of time the acid fermentation has continued. But if fresh buttermilk is used or sour milk, which has just reached the consistency of custard, i. e., before the whey has separated or but shortly after that process has begun, a very definite rule may be used as follows: Crush the soda to a fine powder. Of this powder take one level teaspoon to one pint (two teacups) of sour milk or buttermilk. Always sift the soda several times with the flour and use the milk as the wetting. By this method the soda and sour milk or buttermilk may be successfully substituted for baking powder in any recipes for baking.

If you need but half a teaspoon of soda (as for one cup of milk) be sure to fill your teaspoon full, strike it level with the straight edge of a knife, and with the knife divide off one-half from the handle to the tip of the spoon, thus making an even division.

Many of the old recipes direct mixing the soda with the sour milk, but this is an unreasonable and unscientific procedure. Much of the gas (carbon dioxide), upon which the lightness of the product depends is thus lost. If the soda is mixed with the flour the carbon dioxide is formed gradually during the addition of the milk and the gas bubbles are caught and held by the dough.

If milk or buttermilk stands too long before using the extra acid developed will require more soda, and to gauge the amount correctly is almost impossible. If too little soda is used to completely neutralize the acid the product is soggy. If more than enough soda to neutralize the acid is used the product has the disagreeable soapy odor and taste and the yellow color so well known.

It would seem unnecessary for a housekeeper in Southern California to use much baking powder. One level teaspoon of soda will neutralize the acid of one good lemon. The writer

has made biscuit, using soda in the flour and the juice of a lemon (free from pulp) as part of the pint of wetting. Everyone supposed them to have been made with baking powder until told otherwise.

A few especially good recipes are as follows:

Queen Griddle Cakes

One pint of good rich buttermilk (or one pint of sour milk and two tablespoons sweet cream), one pint of flour, one large apple chopped or sliced very fine, one egg, one teaspoon salt, one teaspoon soda. Sift soda, salt and flour well together. Put the egg into the milk without beating. Add the flour and apple and beat well together. Bake on a hot griddle.

Note—If the flour used makes too thick a batter thin with a little sweet milk or water.

Little Gem Tea Cakes

One cup sugar, one cup thick milk or buttermilk, one egg, piece of butter the size of an egg, one-half teaspoon soda, one-half teaspoon salt, one cup seedless raisins, two and one-half cups flour. Sift well together soda, salt and flour and stir in the raisins. Rub butter and sugar together, add the egg and beat well. Pour in the milk and part of the flour mixture; beat together. Add the remainder of the flour and beat thoroughly. Drop by spoon into hot buttered gem pans. Sift granulated sugar thickly over the tops and bake in quick oven about 20 minutes.

Note—Do not forget to sift on the sugar. The product is not at all the same for flavor or lightness without it.

Blackberry Short Cake

Two tablespoons butter, one cup sugar, one egg, the juice and grated rind of one lemon (good-sized and juicy), one teacup sweet milk (i. e., one-half pint), two teacups flour, one level teaspoon soda. Sift flour, salt and soda well together. Cream together sugar and butter; add the egg and beat well.

Put the lemon juice and grated rind into a teacup and fill up with sweet milk or water. Add to the previous mixture. Add the prepared flour and mix well. Bake in three layers.

Take a platter large enough to hold juice. On this place the layers upside down, covering each thickly with blackberries mashed with a plentiful supply of sugar. Pour on all juice.

The lemon combination in this case is very delicious.

Griddle Cakes

These are light as a feather. Make batter over night of one pint of water or milk, one teaspoon salt, one yeast cake dissolved in warm water and flour enough to make light batter. In morning add one and one-half cups sour milk or buttermilk, two eggs well-beaten, one tablespoon melted butter, one level teaspoon soda and flour to make consistency of pancake batter. Let stand 10 or 15 minutes and bake. —Mrs. H. B. Kindscher, Oxnard.

Soda Biscuit

For each quart of flour use one level teaspoon of soda. Sift thoroughly through the flour, or the soda may show in yellow streaks through the biscuit. Use one level teaspoon of salt and two of shortening. Mix with buttermilk or part buttermilk and part thick sour cream, not much stiffer than in making baking powder biscuit.

If you use the sour cream omit the shortening. Bake in a hot oven. —Mrs. J. F. D. Lindsay.

Biscuit

One quart flour, one teaspoon salt, three teaspoons lard rubbed well into the flour, one teaspoon soda dissolved in one pint sour milk. Roll out well and cut with biscuit cutter and bake 15 to 20 minutes in quick oven. —J. C. Goodrich, Alpaugh.

Bran Biscuits

Two cups bran, one cup whole wheat flour, one and one-half cups sour milk, one-half cup olive oil, three tablespoons molasses, one teaspoon soda, one teaspoon salt. Bake in muffin tins. —Mrs. H. W. Hall, Ponoma.

Milo-Maize Johnnie Cake

One pint milo meal, one-half pint wheat flour, one egg, two tablespoons sugar, two tablespoons molasses, one teaspoon salt, one teaspoon soda, one cup sour milk. Bake in a sheet and cut in squares.

This is a new recipe I originated a few days ago. —Laura F. Kimball, National City.

Brown Bread

One cup corn meal, one cup graham (or rye) flour, one cup wheat flour, one cup sour milk, two-thirds cup dark honey, slightly warmed; one-fourth cup sugar, two mixing spoons cream, one-half teaspoon salt, one teaspoon soda dissolved in the honey. Mix well and fill a well-buttered mold two-thirds full and steam three hours. —Mrs. H. F. Mellen, Acton.

Graham Bread

Two cups buttermilk, one cup sweet milk, one scant teaspoon soda, one scant teaspoon baking powder, one-half teaspoon salt, three cups Graham flour and two cups white flour. One-half cup of raisins makes a nice addition. Bake one hour. —Mrs. Alice E. Myers, Angiola.

Nut Bread

One and three-fourths cups Graham flour, three-fourths cup white flour, one small teaspoon salt, one-half cup brown sugar, one and one-half cups (large) sour milk, one-half teaspoon soda and a little baking powder. Stir all dry ingredients together and put in one large cup walnuts broken in small pieces before adding milk. Bake covered about one hour. —Mrs. N. C. Johnson, Chatsworth.

Graham Bread

One cup sour buttermilk, one-third cup molasses, one teaspoon salt, one teaspoon soda, two and three-fourths cups Graham flour, one tablespoon melted butter. Beat all together thoroughly. Steam two hours. —Mrs. N. L. Dryden, Hollister.

Brown Bread

Two cups corn meal, one cup whole wheat flour, two cups fresh buttermilk, two-thirds cup New Orleans molasses, one level teaspoon soda. Pinch of salt. Grease mold and steam three hours. Then take out of water and bake in mold 20 minutes. —W. D. W., Arroyo Grande.

Oatmeal Bread

Two cups sour milk or buttermilk, two cups Graham flour, one and one-half cups white flour, one and one-half cups oatmeal, one tablespoon melted shortening (any kind), one tablespoon brown sugar, one teaspoon each baking soda and salt. Bake for 45 minutes in a loaf in a moderate oven. —Mrs. J. William Randall, San Dimas.

Cheese Cakes—(English Recipe)

Heat a quart of sour milk very slowly until the curd separates from the whey; cut the thick milk into squares and it will cook in the whey more evenly; drain carefully through a cloth or colander. Beat the curd fine with a fork or put it through a sieve; add two beaten eggs, one-half cup sugar, the juice of a lemon, some grated nutmeg and a pinch of salt. Bake slowly in patty pans lined with puff paste. —Mrs. O. P. Towne, Downey.

Soft Ginger Bread

One cup brown sugar, one cup New Orleans molasses, one cup shortening, one cup sour milk, three cups flour, one teaspoon each of salt and soda, two teaspoons of ginger, three eggs. Cream sugar and shortening, add molasses; dissolve salt and soda in sour milk and add to the mixture; beat eggs and stir in; sift flour and ginger into the mixture and beat thoroughly. Turn into a well-greased pan, into which flour has been dusted and bake in a moderate oven 45 minutes. —Mrs. J. W. Lander, Exeter.

Hurry-Ups

One cup rolled oats, one cup flour,

one large tablespoon shortening, one large tablespoon sugar, one teaspoon salt, one-half teaspoon soda, one-half cup buttermilk or sour milk.—A. K. Swain, El Centro.

Tutti-Frutti Cake

One and one-half cups brown sugar, one heaping tablespoon shortening, one egg and yolk of another, one cup sour milk with two teaspoons soda, two cups flour, two teaspoons each of cinnamon and nutmeg.

Filling

One cup sugar and four tablespoons water. Boil until it will spin a thread. Have the white of one egg beaten stiff and beat the syrup into egg gradually. When thick add one cup chopped raisins. Excellent.—Mrs. H. A. Brimmer, San Bernardino.

Ginger Bread

One and one-half cups flour and one teaspoon each of soda and ginger sifted together; one-third cup shortening, one-half cup each sour milk (preferably buttermilk) and grape syrup.

This is a good original recipe, and is very inexpensive. The grape syrup is made simply by boiling the juice of ripe grapes, and nothing else, till it ropes slightly. Any one who has access to a vineyard can get all the culls or second crop grapes she wants for little or nothing. They make as good syrup as any.—Delia E. Burd, Lodi.

Preserving Time Again at Hand

Part Corn Syrup Being Used In Place of All Sugar

Every woman who does her own preserving will be interested to know that most excellent results are being obtained by the use of part corn syrup and part sugar, in place of all sugar, in the making of all kinds of preserves, jams and jellies. The corn syrup being less sweet, more of the natural flavor of the fruit is retained, and it is only necessary to use sufficient sugar to make the product suit the taste of the individual. This is particularly true in canning pears, peaches, raspberries and many other of the more delicately flavored fruits.

In order to demonstrate this properly, it is essential that the best quality of corn syrup be used. Most excellent results are being obtained with the brand of syrup known as Karo (Crystal White), which can be obtained at all modern grocers. This is the ideal preserving syrup; and if you have not tried it before, be sure and do so this season.

In ordering ask your grocer for a copy of the little Karo Cook Book, which contains much valuable information on the subject of preserving, as well as on culinary subjects generally. For preserving purposes always specify Karo (Crystal White)—to distinguish it from the Karo table syrup.

Why Suffer Longer From Ants?

When Their Extermination Is A Comparatively Simple Matter?

If you should ask the average housekeeper to name the principal annoyances with which she has to contend, ants would invariably be given a prominent place in the list.

This will not hold true for any great length of time, however, for women everywhere are rapidly learning of the great discovery made by a baker and candy-maker in Los Angeles, whose place was over-run with ants, but who originated a paste which rid his shop entirely of them in one day. So rapidly did the news of the discovery spread that it was necessary to build a large factory to supply the demand.

This remedy is put up for general use under the name of Kellogg's Ant Paste and can be obtained at all good druggists. Women everywhere are using it with surprising results. Try a package today.

Buttermilk Nut Cake

Two cups granulated sugar, half cup butter or other shortening, two cups fresh buttermilk, one large teaspoon soda in milk, one cup chopped raisins, one cup chopped or ground English walnuts, three level cups flour, one teaspoon nutmeg, one teaspoon cinnamon; bake slowly.

The batter wants to be a little thicker than when you use eggs.

This is one of my best cake recipes.—Mrs. G. W. Mullendore, Perris.

Brownstone Front Cake

Three-fourths cup chocolate, one-half cup sweet milk, two-thirds cup sugar, yolks of three eggs. Put on the stove in a double boiler and cook to a custard, adding the eggs last as they thicken it. Take one-half cup butter, one cup sugar, one cup sour milk, two cups flour, whites of three eggs, one teaspoon soda dissolved in the sour milk, one teaspoon baking powder. Let the custard cool and add to mixture last. Beat all together and bake in four layers. Flavor with vanilla. Filling—One cup of sugar, one-half cup thin cream and two tablespoons syrup. Let boil till it forms a soft ball in cold water. Cool, then beat till creamy and spread on cake and you have a cake fit for the queen.—Mrs. C. W. McEwen, Modesto.

Chocolate Cake

One large cup sugar, one cup sour milk, one-third cup shortening (softened), one egg and yolk of another (or one large or two small eggs), one level teaspoon soda, salt (unless you use butter for shortening), two cups of flour, and two teaspoons cocoa or grated chocolate. Put all ingredients except one-half cup of the flour into mixing bowl and beat well. Then add the one-half cup flour with perhaps one-half teaspoon of baking powder. Bake in layers and put together with white frosting.—M. D. Jennings, Redlands.

Prince Albert Cake

Two-thirds cup butter, two cups sugar, three eggs, one cup sweet milk, three cups flour, one teaspoon cream tartar, one-half teaspoon soda; bake two-thirds of this in two pans and to remainder add one tablespoon molasses, one-half cup currants, one tablespoon cinnamon, cloves and nutmeg. Put together with plain icing.—Mrs. John Scruby, Whittier.

Peter Pans

Half cup brown sugar, one egg well beaten, half cup molasses, two-thirds cup sour milk, teaspoon vanilla, teaspoon powdered cinnamon, two cups pastry flour, into which one teaspoon of soda has been carefully sifted, half cup each of finely chopped nut meats and raisins, one-fourth cup butter, one-fourth cup lard. Cream the lard, butter and sugar; then in order named add other ingredients, beating thoroughly. Drop on buttered tins and bake in a hot oven.

Sour Cream Frosting—Cup thick, sour cream, one and one-half cups granulated sugar, pinch of soda; boil about eight minutes; remove from fire, add cup finely chopped nut meats, stirring until cool.

In all the above recipes level measures are used; if the milk is quite sour use one-third more soda. Where lard and butter are called for Crisco or Cottole may be advantageously substituted, giving equally as good results, and reducing the cost materially.—Mrs. C. B. Kirkpatrick, Los Angeles.

Oatmeal Cookies

One and one-half cups rolled oats, one and one-half cups flour, one cup sugar, three-fourths cup cut raisins, one-fourth cup walnut meats, four tablespoons melted butter or lard, four tablespoons sour milk, two eggs, one-half teaspoon soda, one-half teaspoon cinnamon. Mix dry ingredients and fruit; add beaten eggs and milk with soda dissolved in it. Mix well; add melted butter and drop in teaspoon on baking sheet.—Annie M. Beals, Corvallis, Oregon.

Oatmeal Cookies

Three cups flour, one cup shortening; mix as for pastry. Add one and one-half cups granulated sugar, one and one-half cups oatmeal, nutmeg and cinnamon to taste, one cup raisins, one cup chopped walnuts,

one teaspoon salt, one teaspoon soda, one cup of thin sour milk. Mix well and bake in slow oven.—Mrs. H. S. Ackleson, La Canada.

Cookies

Three eggs, three cups sugar one cup lard or one-half cup lard and one-half cup butter, one cup buttermilk, one teaspoon soda, one teaspoon vanilla, pinch of salt, flour to make soft dough. Cream sugar and lard and add beaten eggs. Dissolve soda in milk and add flavoring and stir in flour. This makes a good plain cookie, and is fine with a cup of raisins added or any kind of nut; especially fine with peanuts or black walnuts.—Mrs. L. W. Miller, Salinas.

Soft Jumbles

One and one-half cups sugar, one cup sour cream, two-thirds cup butter, three eggs, three cups flour, one teaspoon soda, one teaspoon vanilla. Bake in gem pans.

Frosting—Two cups powdered sugar, one-half cup chocolate, one-half cup sweet cream. Just boil up and beat till cool. Add vanilla and

spread.—Mrs. W. S. Brown, Winton.

Old Fashioned Cookies

Two eggs, two cups sugar, one-half cup lard, one-half cup sour milk, one-half cup thick sour cream, one teaspoon soda, one teaspoon baking powder. Mix not too stiff if liked soft; roll rather thick, cut and sprinkle with sugar before baking.

The cup used is a half-pint measuring cup, not a teacup, nor a coffee cup.—Mrs. M. F. Beardsley, Campbell.

Doughnuts

Three eggs and one and one-half cups sugar. Beat thoroughly until light; add one-half cup sour cream and beat again. Then add one cup good buttermilk, one teaspoon salt, one teaspoon vanilla, one-half teaspoon nutmeg, one teaspoon soda dissolved in the buttermilk; flour to make right consistency to roll. Cut with doughnut cutter and fry.—Mrs. R. H. Leeson, Ontario.

Doughnuts

Two eggs, one and one-half cups (Continued on Page 23.)

Gas Stove
Convenience
with Kerosene

Kitchen Economy

With wood or coal—waste heat. Too much or too little for best cooking. In hot weather too much heat coming out into the room.

With a good oil-stove—no waste heat or fuel. One burner or four—low flame or high—a slow fire or a hot one. All the convenience of gas for every home, all the year round.

New Perfection Oil Cook-Stove

For Best Results Use Pearl Oil

Better cooking,—flame adjustable to just the degree needed for roasts, for bread, for pastry. No odor. Does not taint the food. A cool cook and a clean kitchen. Ask your dealer. See demonstration, Palace of Manufactures, Panama-Pacific Exposition.

Manchurian Butters	4.50@4.75
Red Mexican	5.40@5.50

ment of new crop has become more active as there have been received a number of shipments of second cutting new hay of nice type and apparently in good condition. A cargo of second cutting from the river district has attracted notice on account of its excellent quality, being better than anything we have seen for a long time. Prices of the new crop appear to be based on the going prices of the old crop. Fancy Wheat Hay (lt. bales.)

We quote the average wholesale selling price of hay in carload lots on today's market as follows:

Fancy Wheat Hay (lt. bales)	13.00@14.00
No. 1 Wheat or Wheat and Oat	10.50@11.50
No. 2 Wheat or Wheat and Oat	8.00@9.00
Choice Tame Oat	11.00@11.50
Other Tame Oat	7.50@10.00

Citrus Fruit Market

LOS ANGELES, June 30, 1915.

A very satisfactory condition prevails in practically all orange markets. It is thought there may be a slight easing up after the fourth of July trade, but at the same time there is promise of a very satisfactory condition throughout the season.

Lemons are still showing great weakness. The market is filled with fruit held back. Many sales have been made around the dollar mark, which means that freight simply has been received for the fruit. The weather is cold and rainy and there is absolutely no demand for lemons. Shipments at this end are being held up and this will continue until the market is cleared of some of the fruit now stored.

Shipments.

Shipments of citrus fruits from Southern California points since November 1, 1914: Oranges 23,772, lemons 4774, total 33,546; to same date last year, oranges 30,960, lemons 2185, total 33,145. Tulare County: Oranges 5648, lemons 198, total 5846; to same date last year, oranges 5854, lemons 39, total 5893. Northern California: Oranges 630, lemons 2, total 632; last year same date, oranges 404, lemons 5.

NEW YORK, June 28.—Twenty-eight cars Valencia, two navel, one St. Michaels, three mixed cars, and six cars lemons sold. Market unchanged on oranges, weak and lower on lemons.

"Three years ago," says President F. A. Seiberling of The Goodyear Tire & Rubber Co., "bankers were wondering where the people of the United States would get the money to pay for the 150,000 automobiles then manufactured. There are now 1,500,000 machines in use, and next year the number will pass the 2,000,000 mark. This great expansion of the automobile business will require millions of additional tires."

One of our neighbors lost a horse Thursday from overheating. To work horses to the limit while the temperature is above 90 degrees, and not a breath of air is stirring, is neither profitable nor humane. As a rule the horse is not given the consideration that he deserves. Drivers are too often actuated by selfish motives in their treatment of these faithful friends of ours upon which depends the prosperity of the owners.—Ex.

POSSIBLY SO.

"You say there are lots of skunks out in the country where you live?"
"Yep, a right smart."
"Mercy! I don't see how you could stand them!"
"It may be, son—excuse me for movin' to windward of ye—that it's because they don't smoke cigarettes."

Tulare County has invited the California Fruit Growers to meet at Tulare in December.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department. Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Mortgaged Property Sold

A loans money to B, taking his note secured by mortgage on real estate. B sells property to C subject to mortgage. To whom does A look for his interest, to B whose note he holds or to C? If C fails to pay interest when due can he still hold B?—Subscriber, Hemet.

C, taking the property subject to the mortgage and not assuming the same, is not liable for a deficiency judgment on the same, and the only recourse of A for his interest is upon B, or if the interest is not paid to foreclose the mortgage.

Wife's Property

Husband's son by first wife deeded property to husband's second wife, mortgaged without interest, not paid for. Is same absolutely hers on husband's death (no will)? Can she sell or rent same without the son's consent? If she dies before it is paid for, whose is it, and has she any right to will it to anyone? No children by second wife.—Subscriber.

The property being a gift to the wife, became her separate estate and she has an absolute right to devise it to whomsoever she may desire.

Presumption of Gift

A widow with one son, on remarriage put her money all into the home property, in the husband's name. Should the wife die what part of the estate would go to the son? No children other than this son, no children by second marriage. How would the property be divided between the stepfather and son?—Subscriber.

Having placed her separate property in her husband's name a presumption of an absolute gift to the husband will arise. The wife is entitled to will her separate estate to whomsoever she may desire, and she could therefore will this property, if it was her separate estate. For precaution it would be well to have a written agreement between the parties concerned as to the real owner of this property. As, if the presumption of gift would prevail, the husband might take the whole property; whereas, if this did not prevail, it being the separate property of the wife, she could do whatsoever she desired.

GETTING EVEN WITH DAD

"This war will go on and on," said Mrs. Harry Payne Whitney, who has given a \$250,000 field hospital to the belligerents.

"This war will go on and on," she repeated sadly, "and the side that is getting the worst of it will display the spirit of little Willie."

"Little Willie's father, as he laid on the slipper, said:

"Willie, this hurts me more, far more, than it does you."

"Then keep it up," said little Willie, grinding his teeth. "Keep it up, dad. I can stand it."—Washington Star.

VISITOR AND VICTIM

"Madam," said the man in the street car, "I know I ought to get up and give you my seat, but, unfortunately, I've recently joined the Sit Still Club."

"That's all right, sir," replied the woman. "And you must excuse me for staring at you so hard; I am a member of the Stand and Stare Club."

She proved herself so active and conscientious a member that the man began to feel uncomfortable under her gaze. Finally he rose and said: "Take my seat, madam; I guess I'll resign from my club and join yours."—Boston Transcript.

SODA IN BAKING

(Continued from Page 21)

sugar, one cup sour milk, one and one-half teaspoons soda, one small teaspoon cream tartar, very small piece butter, little nutmeg and salt. Mix soft dough and fry—Mrs. C. A. Hilton, Modesto.

Doughnuts

Beat one egg and add to it one cup of sugar, a pinch of salt, nutmeg to taste, and one and one-half cups of sour milk in which one teaspoon of soda has been dissolved. Then add two teaspoons of melted lard or butter. If sour cream is used omit shortening. Stir in enough flour to make soft dough, about four cups. Roll out one-half inch thick; cut and fry in deep fat.—Mrs. D. H. Tarbet, Onarga, Illinois.

Tomato Soup

I don't believe it is generally known that just as good tomato soup can be made from sour milk as sweet, providing it has not clabbered. Use one quart tomatoes, two sliced onions, small, one level teaspoon soda. Cook together until it quits foaming, then add one quart milk (sour or sweet). Thicken with flour worked into butter and when thickened strain through a sieve, salt and pepper to taste and serve.—Mrs. R. V. Langford, National City.

Sour Cream Salad Dressing

A salad dressing which makes a welcome change is made of thick sour cream whipped stiff and seasoned with vinegar, sugar and paprika, with a little celery seed added if desired. For a cup of cream use a tablespoon of vinegar.—Mrs. Cora Irwin, Lancaster.

PRIZE WINNERS

Mrs. Berneike's splendid article, "Soda in Baking," receives first prize; Mrs. C. B. Kirkpatrick's, second.

JULY PRIZE CONTEST

For outdoor lunches. A subscriber has asked for suggestions for picnic lunches, campfire parties, etc., for the vacation good times.

For best list of good things for outing lunch with one recipe the Cultivator will give \$2.00; for second best, \$1.00. All published will receive three months' subscription to the California Cultivator. If a member of your family is now subscribing send the name that subscription may be extended.

Those who have received one extension of subscription this year are not entitled to another. All may however compete for cash prizes.

Write Early

Write early. All letters should be in this office by the morning of July 15. Recipes will appear in issue of July 22.

Please write on one side of paper only. Address letters to California Cultivator, Los Angeles. Send only one suggestion, the one you yourself think the very best. So much splendid material was contributed for the June contest that we could not use for lack of space that our feelings were dreadfully hurt; we wanted to use it all and we wanted you all to see it all. Therefore we will ask you to do the selecting yourselves of the one best.

Send Suggestions

Any suggestions for future contests will be gladly received. The Cultivator wishes to give what its readers most need or are most interested in. The present issue's presentation of use of soda in baking was the result of a request from a subscriber, as is the subject of the July contest. Send in a subject for August.

WOULD GET A CHANCE

Dolly—At last I have met my ideal! Kind-hearted, modest, patient, self-denying. But, alas, he is married.

Daisy—Don't worry; no woman will live long with such a freak. You'll get a chance yet.

"The Car of No Regrets"

**\$1350
COMPLETE**

EIGHT CYLINDER KING

**40-45
HORSE POWER**

**A city man's car in beauty, silence and flexibility.
The Farmer's car in power, strength and dependability.**

The King Eight Cylinder was announced October 26, 1914. It is the pioneer popular-priced Eight, and its success has surpassed the most sanguine hopes of its builders. Hundreds of King Eights, all over America, are daily teaching motorists what they should now expect from an automobile. In England alone, 90 King Eights are successfully operating, and South Africa, Australia, Spain, Russia, Sweden, Venezuela, Holland, Cuba, and many other foreign countries have purchased, then praised, this wonderful car. These export successes are the strongest proof of King Eight efficiency, as no "service" can be given and purchases are made only after the most exhaustive investigation.

The reasons for Eight-Cylinder superiority are easily understood. A Four-Cylinder engine has two power im-

pulses per revolution; a Six-Cylinder, *three*; while the "Eight" has *four*. This almost "turbine" flow of power means, in the King Eight, traveling from a creeping mile and a fraction to a racing 50 without gear-changing, and the ability to gather speed up to 30 miles an hour in 20 seconds. Such flexibility naturally reduces vibration to nearly nil, which in turn results in silence and longevity and adds to riding comfort.

This Eight will give better than 15 miles to a gallon of gasoline, and over 800 miles to the same measure of motor oil. The famous King Cantilever Springs contribute their large part to the car's easy-riding qualities, and its complete equipment includes a Ward Leonard electric starting and lighting system and an engine-driven tire pump.

There's a King dealer in your locality.

One Dollar Yearly

U. of C. Summer Travel Course in Citriculture

With Introduction by Dr. J. Eliot Coit. Most Valuable Feature of Citricultural Work. Letters from Each Member of the Class as to This Year's Lessons

EACH summer during vacation the division of citriculture of the college of agriculture conducts a summer travelling course for the benefit of students who intend to specialize in citriculture. The object of this is to widen the students' horizon and make sure that each graduate has some practical knowledge of the great citrus industry of California as a whole as well as information gained from lectures, laboratory and library work. The course lasts six weeks, and each student pays his own expenses which average about \$125. Students unable to take the course may fulfill the requirements by working for wages 12 weeks on some acceptable citrus ranch and keeping the necessary notes on their work and the ranch itself. Students are required to take this work at the end of the sophomore year and before they begin class-room work on citrus fruits.

This year the travelling course began with a few days at the San Francisco exposition and proceeded to Sacramento, thence north through the East side of the Sacramento Valley to Tehama, thence south through the West side to Davis. From Davis a jump was made to Fresno and from there southward the citrus ranches around the following towns were visited: Exeter, Lemon Cove, Porterville, San Bernardino, Highlands, Redlands, Fontana, Riverside, Corona, Orange, Chula Vista and San Diego. Two days were spent at the San Diego exposition and the class moved back to Los Angeles, where some time was spent in neighboring districts such as Whittier and Pasadena. At the offices of the Fruit Growers' Exchange a series of lectures was arranged by Mr. Powell and others of the exchange force. Covina, San Dimas, Pomona and San Fernando were also visited and then the class moved to Santa Paula, where the boys put in a few strenuous and exceedingly profitable days at the Rancho Sespe and the Limoneira. At Santa Paula the class disbanded after turning in the bulky notebooks for correction and grading.

This year the boys have been more impressed with the difficulties than with the advantages of citriculture. This has been due partly to the attitude of conservatism following the low average prices received for citrus fruit this year, and partly to the growers' desire to discuss their particular perplexities and problems with the professor in charge. Such a course, by the way, is a very good thing for the professor in charge, as it keeps him in close touch with local conditions in all parts of the state and helps him to make his classroom teaching concrete rather than abstract.

The editor of the Cultivator has invited each of the boys to write a short statement of his impressions received during the trip and the articles which follow reflect the feeling of uncertainty referred to above. After two years' classroom study and discussion of the various practices observed the students will have their minds clarified to an extent at least and will feel more confident and sure of themselves.

The writer wishes to take this opportunity, in behalf of the college and the class, to extend thanks and assurances of keenest appreciation to the many growers and others who have given so generously of their time and hospitality in order that this group of young men may be better educated and more broad-minded Californians.

IMPRESSIONS AFTER A SURVEY OF THE CITRUS INDUSTRY

By H. R. Kelley

Two things stand out above a host of impressions received during a brief survey of California's citrus industry. The most important one in my mind is that growing citrus fruits still presents a large number of unsolved problems. Successful growers follow practices which may be almost opposite to those of their neighbors who get equally fine results. Another grower with similar conditions of soil and climate may imitate one of these successful men and yet have very poor results.

No one appears to be able to account for this or give any definite information as to what is right or wrong in citrus culture. All styles of pruning are in effect and examples may be found where each is successful and others where they are failures. Men who should know if any one should, after having spent years in studying the matter, frankly admit that they have arrived at no definite results.

In view of this fact, it seems to me that a young man starting out in the citrus game is making an investment somewhat blindly, as he has few clear-cut precedents to follow and little assurance that his planting will ever be profitable.

This brings me to the other impression, which is strongest with me, that citriculture to be properly carried on requires a great deal of capital. A poor man has no surplus to carry him over a freeze or a period of poor prices. Neither can he invest money in experiments to determine as near as possible the best procedure for his particular soil and climatic conditions.

The man of means can do these things, as he can stand the loss if his experiments prove to be failures or if unforeseen happenings temporarily cut off or delay the income from his grove. I draw this conclusion after observing a good many orchards, for in so many cases the best were large holdings belonging to wealthy men or companies who have the capital to carry them over low markets such as are in effect at the present time, and at the same time do not have to neglect their groves, but can keep them in the best condition so that they may be more profitable in the good times which are sure to come.

* * *

SCIENTIFIC EXPERIMENTATION

By H. E. Kowalsky

The thing that impressed me most after the trip is that the citrus industry at the present time is still in the experimental stage of development. As new sections of the country are being planted out to citrus trees there arise new conditions that force the grower to try out new ideas and practices. In the older citrus sections of the state the soils are becoming depleted and the growers are confronted with the problem of keeping their trees in condition to continue producing maximum crops.

This explains the necessity for experimenting on the part of the growers and a great many experiments of merit and value are being conducted. The practice of experimenting, however, is in itself a rather complicated study and it can hardly be expected that those who have not made a special study in this branch of work will accomplish marked results.

What seemed to me to be a mistake is the use of a large acreage to try

out a single plan. I base my assertion on the practice of the experiment stations. If the chief of an experiment station had the idea that sodium nitrate was a desirable method of nitrogen application and proceeded to treat his entire experiment station with sodium nitrate, the growers would object. They would demand a more careful and varied method of investigation. However, it is a well known fact that a large number of men are using their entire acreage of citrus to try out a single idea, and sufficient checks are seldom left.

Some growers believe in commercial fertilizer, others in cover crops, stable manure, clean culture or mulch. Some men use lime in wholesale quantities and others believe in pruning away a third of their trees. Those operations may be advisable under certain conditions, but under other conditions they may be detrimental. However, growers cannot be certain that their trees need lime, heavy pruning, etc., unless these things are tried. They realize that something must be done for their trees and follow the idea that appeals to them as most advisable.

Failing in clear-cut results the grower often proceeds to put his entire grove under a different treatment without considering what effect this will have on the treatment given the previous year, and so in a dozen years a dozen different treatments are applied. At the end of this time the trees may have been improved or injured, but in either case such a variety of things has happened to them that it is impossible to say what was the cause of the improvement or injury. Perhaps it was the treatment at the end of the twelfth year, most likely it was a combination of all the operations throughout the 12 years. Thus, although the grower has obtained results instead of an understanding as to how these were obtained, he must continue experimenting to try and maintain the production of his orchard.

In trying to arrive at a solution of this problem one idea presents itself to me. Could it be possible to establish experiment clubs throughout the state? That is, have eight or ten men who are really working out ideas on their own ranches club together and secure a scientifically trained man, such as a farm adviser, to come into their groves and check up their experiments for them. Such a man could keep detailed records of the trees, conditions of climate, soil and yields in much the same way as is done at an experiment station. Using a half-acre to one experiment, the grower could try out a number of ideas scientifically conducted. At the end of four or five years he might better know what treatment his particular conditions call for.

If the growers could obtain in this way definite information about their special problems, it seems to me that the citrus business would be taken out of the speculative class and take its place as a stable agricultural industry.

* * *

CITRICULTURE NOT AN EXACT SCIENCE

By Hans Lemcke

The wonderful variation of the conditions under which citrus fruits are grown throughout California and the apparent uncertainty on the part of many growers as to what their results are to be has impressed me most during the trip. There seems to be a striking lack of cocksureness among

the growers. When questioned as to their reasons for doing things a certain way they usually reply that they do not know. In fact, there seem to be so few well formulated rules to go by that the young man just getting acquainted with the business tends to be confused.

Definite and accurate knowledge in regard to many phases of the business may be in existence in books, bulletins, or the brains of a few men, but if this is true there is a wonderful opportunity for dissemination of such knowledge. I think the average grower with whom we talked has not yet mastered all the information which has been made available by the scientists. The farm advisers, as retailers of knowledge, may do a great work here.

A very few of the largest and best known growers are doing a great deal by clubbing together and pooling the ideas gained by any one of them, but this does not reach to the masses and is hardly available to the average grower except as it may in future be driven home by public demonstrations arranged by farm advisers in a very large number of orchards scattered through the citrus growing districts.

* * *

SOILS FOR CITRUS GROWING

By Donald Campbell

Judging from our trip, if I were asked, "What type of a soil does a citrus tree need?" I would say, "Any type."

As we have traveled over the state and viewed citrus trees from all angles, under all conditions, I can say frankly that I have seen the citrus tree growing luxuriantly on every type of soil, from a coarse open gravel soil to a clay which had to be blasted.

Let this be true, there is yet another thing to consider. The groves that are the most uniformly healthy and productive throughout are nearly always the ones which are growing on ground that has a high humus content.

This great factor in soil life, humus, cannot be safely overlooked by any one. It is as essential for proper tree feeding as fruit and vegetables are to man's diet.

The best example I saw of this practice showing returns was at Hamilton. The Mills Orchard company started in with their land when it was so hard you could not get a plow into it. By repeated applications of alfalfa, straw, cornstalks or anything they had, they have brought that soil into a rich, aerated, flocculent state. Now it can be worked with ease and will grow anything.

They regard agriculture as a banking business. The soil is the capital, the net profits the surplus. If the surplus is spent no gain the following year will be realized over the first, whereas if the surplus is added to the capital the next year will yield larger profits. Following this out, each year they put back into the soil in the way of organic fertilizer profits they have made on their crops. As a result they are building up a rich soil, their capital.

Such a soil will eventually be able to support a large tree in its production of tremendous crops, and not only this, the fruit will be of best quality. I am convinced, moreover, that it is the best policy to start right. It is far easier and cheaper to build a big soil capital before the trees are planted and while they are small than to attempt revolutionary measures of soil treatment

(Continued on Page 33)

STATE FRUIT GROWERS' CONVENTION

THE 45th State Fruit Growers' Convention will convene in Palo Alto Tuesday evening, July 27. On that evening David Starr Jordan, chancellor of Stanford university, will extend welcome. Response will be made by State Horticultural Commissioner Cook. Features to be touched upon will be the outlook as to various fruits. The outlook for the pomelo will be discussed by R. S. Vaile, assistant professor of orchard management, citrus experiment station, Riverside; the walnut, J. B. Neff, a practical grower; the prune, E. N. Richmond, grower and packer; the apple, J. B. Hickman, horticultural commissioner, Monterey County; the apricot, F. B. McKeivitt, a grower and member of California Fruit Distributors; the peach, F. B. Roullard, horticultural commissioner Fresno County; the cherry, speaker to be announced; the grape, Frank T. Swett, horticultural commissioner, Contra Costa County.

On Wednesday morning at 9 o'clock (it is to be noted Dr. Cook still believes in getting into action early) the session will be held in the college chapel of the university. Committees will be appointed and addresses made as follows: Pear Culture, R. H. Parsons, a pear grower of Seattle; Control of Pear Blight, E. A. Gammon, pear orchardist; Blight Resistant Roots, A. L. Wisker, president Grass Valley Farmers' club; The Outlook for Pears in California, Percy Gammon, orchardist.

At the same time Wednesday morning a session for women will be held in room 460 of the physiology building of the university, at which Miss Lillian D. Clark of the university extension work will preside. At this session the following addresses will be given: Bee Culture—Honey Making, Mrs. H. C. Acklin, bee expert; Growing Nursery Stock as a Business for Women, Mrs. L. E. Sexton, horticulturist; An Apple Ranch and Its Development, Miss Vida French, apple grower.

On Wednesday afternoon at 1:30 in the college chapel: The Codling Moth, A. L. Melander, professor of entomology, State Agricultural college, Pullman, Washington; Blight, Resistance of Pears and Pear Stocks, F. C. Reimer, superintendent Southern Oregon experiment station; Sub-tropical Fruits Which Give Promise in California, D. L. Crawford, professor of botany, Pomona college; The Grower as an Experimenter, E. S. Thacher, semi-tropical fruit specialist.

At the Wednesday afternoon session for women Mrs. Myrtle Shepard Francis, president of the Theodosia B. Shepard company, will give an address on Women as Florists; Mrs. Emily Hoppin, orchardist, will discuss Farming for Women.

At the evening session in the chapel, beginning at 7:30, addresses will be made on Plant Quarantine Service, C. Gordon Hewitt, Dominion entomologist, Ottawa, Canada; Experiment Station Movement in America, S. B. Doten, director Nevada agricultural experiment station; The Lure of the Garden, Mrs. Myrtle Shepard Francis.

On Thursday, July 29, at 9 a. m., President G. W. Pierce of the Almond Growers' association will discuss The Almond Outlook; Miss C. A. Whelan, orchardist, Why I Planted an Almond Orchard; C. S. Vaile, citrus grower, Cover Crops in Citrus Culture; J. G. Lipman, director New Jersey agricultural experiment station, The Interrelation of Soils and Crops.

Thursday afternoon will be devoted to an automobile trip through the famous Santa Clara Valley, in charge of the Palo Alto chamber of commerce.

At 730 p. m., in the college chapel, Birds and Mammals Injurious and Beneficial to the Farmers' Interests, with lantern slides, will be the subject of an address by H. C. Bryant, game expert connected with the state fish and game commission; The Olive, W. F. Oglesby, assistant in viticulture,

Berkeley; The Olive Outlook, B. L. Meek, olive grower.

Friday at 9 a. m., in the college chapel, addresses will be made on The Outlook for the Orange, J. H. Reed, citrus grower; The Outlook for the Lemon, G. W. Hosford, manager San Dimas Lemon association; The Outlook for the position of California Oranges, E. Chace, chemist in charge citrus products, laboratory U. S. D. A.; Operation in Fruit Marketing, H. G. Johnson, sales manager California Farmers' Union; Careful Handling of Fruit, C. S. Milliken, Semi-Tropical Fruit Exchange.

Friday, 1:30 p. m., in the chapel: Uses and Misuses of Infectious Diseases and Insect Enemies for the Control of Insect Pests, A. W. Morrill, state entomologist, Arizona; How a Farm Woman Found Herself, Mrs. Emily Hoppin, orchardist; Proportion Between Hunger and Food Supply, G. J. Pierce, professor of botany, Stanford university; Eelworm Parasites on Plants, Peter Frandsen, professor of biology, University of Nevada.

Friday at 1:30 p. m., in the physiology building, will be held the session for women, with an address by Mrs. Sara Roberts, Canning and Selling Fruits and Vegetables; Canning Poultry and Meats, Mrs. Belle S. Corey; Scientific Jelly Making, Mrs. Hilda B. Nielsen.

At 7:30 p. m., in the chapel, W. H. Olin, agricultural commissioner of the Denver & Rio Grande railroad, will deliver a talk, What Can the Railroad Do to Further the Potato Industry; H. J. Webber, citrus experiment station, Citrus Culture; W. P. Kelley, agricultural chemist of the citrus experiment station, Maintenance of Soil Fertility.

On Saturday morning the convention will adjourn in a body to meet on the exposition grounds, San Francisco, this in honor of horticulturists' day at the exposition. Delegates will make inspection of the exhibits on the grounds and in the various buildings during the day, and in the evening will gather in the recital hall in the eastern part of Festival Hall on the exposition grounds and listen to addresses by Prof. John M. Coulter of the University of Chicago and Director J. G. Lipman of the New Jersey Agricultural experiment station. Prof. Coulter's address will be Mutual Indebtedness of Science and Agriculture, while Dr. Lipman's address will be Present and Future Supplies of Commercial Plant Foods.

* * *

To have placed the events in the natural order we should perhaps have noted that the first session of this great week at Stanford university will begin on Monday, July 26, at 1:30 p. m. This is not the State Fruit Growers' Convention proper, but will be a meeting of the West Coast Potato Association. The first session will be held in the physiology building. The tuber moth will be discussed by Prof. E. O. Essig; Associations and Their Effect Upon the Potato Industry, by R. W. Faulkner of Idaho; A New Thrips Enemy of the Potato, by Prof. D. L. Crawford, Pomona college.

On Tuesday morning, July 27, at 9 a. m., The Value of Potatoes as Food, Miss Lillian D. Clark; Seed Potatoes, W. V. Shear, assistant horticulturist, U. S. D. A.; Varieties of Potatoes, Mrs. Hilda B. Nielsen, a practical potato grower.

Tuesday at 1:30 p. m.: The Need of Experimental Work with Potatoes, E. H. Phreaner, a practical potato grower; Fertilizing Potatoes, W. Q. Fitch, potato specialist, University of Indiana; Fundamentals in Potato Growing, E. H. Grubb, potato specialist. The same evening at 5 p. m. there will be a general discussion of interstate quarantine for the prevention of the spread of potato diseases. Dr. Cook makes an appeal to all interested to be present and take part. It is vital to arrange a plan of marketing California potatoes with as little injury to the industry as possible. Another special meeting will be held on Wednesday afternoon at the same hour to con-

tinue the discussion as to these quarantine orders. * * *

Another gathering which will attract and which is to be held to a certain extent at least during the entire week, will be that of the various County Horticultural Commissioners of California. This organization begins its sessions Monday, July 26, at 9 a. m. in the zoology building of the university, with Deputy State Horticultural Commissioner George P. Weldon in charge. The Relationship of the County Horticultural Commissioner to the County Farm Adviser will be discussed by State Commissioner Cook. Weed Dissemination, by O. W. Newman, and Sulphur Fungicides by George P. Gray, chemist, insecticide laboratory, University of California, will be other features of this first session.

On Monday afternoon in the same building Harry S. Smith of the state insectary and O. W. Newman, George P. Weldon, Profs. H. S. Fawcett, H. J. Quale, S. B. Doten, Peter Frandsen and others will discuss laboratory work. The Monday evening session of the horticultural commissioners will be given over to discussion of Some of the Economic Insects of Lesser Importance in California. In this E. O. Essig of the state university will lead. In addition there will be round table discussion of insects and quarantine measures by E. J. Vosler, E. O. Essig, Frederick Maskew, Commissioner Cook, Deputy Commissioner Weldon, Prof. Quayle and others.

The commissioners gather again on Tuesday morning at 9 a. m., when Prof. C. P. Gillette of Colorado agricultural college will discuss Life Habits of Some of Our Common Plant Lice; A. W. Morrill, Arizona state entomologist, The Relation of Climate to the Distribution of Insects; Prof. A. L. Melander of Washington state college, Abuses of Horticultural Inspection.

The Tuesday afternoon session of the commissioners will be held in the zoology building. The various county horticultural commissioners will enter into a round table discussion as to plant diseases. In this Secretary E. J. Vosler of the state commission and Profs. Fawcett, Horne and others will lead.

The program which Commissioner Cook is now sending out contains the information that rooms can be had at the dormitories on the campus of the university for \$1 per day, meals at 50 cents each. To secure room reservation write at once to Mr. G. A. Clark, academic secretary, Stanford University.

As to railroad rates, more definite information will be given in a later Cultivator, but there will be reduced rates offered. Dr. Cook announces that there is some doubt as to whether there will be 50 present with railroad receipts on the usual fare and a third certificate plan, for there are special round-trip rates offered because of the exposition.

This gathering of the three conventions should bring a great number of horticulturists together. The last convention in Los Angeles brought out between 1,300 and 1,500 registered delegates. It was by far the greatest ever. This should be a still more representative gathering, for the problems confronting the fruit grower seem to have increased rather than decreased. We wish there was more opportunity offered on this program for discussion of marketing questions, for that is one of the most important before the growers of today. However, there is a world of good things which will well repay an entire week's visit to Palo Alto.

KEEP SUGAR BEETS FROM LOSING VALUABLE ELEMENT

The sugar beet farmer who is delayed in getting his crop marketed may keep his beets from evaporating to a great extent by leaving them in relatively large piles and by covering the piles with beet tops. A new bulletin of the United States department of agriculture (No. 199) entitled, "Loss in Tonnage of Sugar Beets by Drying," outlines what is probably the best practice in harvesting sugar beets, as follows:

With a suitable beet plow or digger the beets are first torn from their root anchorage and lifted several inches in the soil, which is at the same time loosened. As soon as sev-

eral rows have been dug, laborers pull the beets entirely out of the ground by hand, throwing those from five, seven or nine rows into piles at convenient distances apart in the line of the center row. Another squad of laborers immediately follows and tops the piled beets, throwing the tops to one side of the pile of beets. Finally the wagon comes and the beets are loaded into it and at once hauled to the factory scales. It is thus possible to haul the first load within about an hour after the digging is begun.

Most beet growers, however, are not able to organize the work so well. For one reason or another several days may elapse before the beets reach the scales. After the beets are torn from their root system, transpiration still continues, but the water thus lost is no longer replaced by the roots. Evaporation also takes place from the underground portion of the beets in the now loosened soil. After the beets have been pulled the evaporation is greatly augmented whether or not the beets have been topped. Commonly, the beets after being topped are thrown into open piles of no great bulk, remaining there until loaded into wagons.

The system of harvesting outlined

above makes it practicable for the beets to be gathered in piles which would average one-fourth of a ton or even more. The beet tops can then be easily and rapidly placed over the piles and they will reduce considerably the evaporation from the beets.

When beets are sold at a flat rate the water content is of the highest importance to the farmer since he is entitled to sell by weight the full normal content of water. Deterioration of sucrose does not occur in appreciable quantity during the short periods of storage under consideration.

In selling his beets to the factory the farmer in most cases is allowed to contract either at a flat rate per ton for all beets containing above the stipulated minimum of sucrose or he may accept a sliding scale of payment whereby the price per ton is modified according to the actual average sucrose content of his beets. Some sugar companies offer a so-called sliding scale, which is in reality two separate flat rates, one for all beets up to a certain percentage of sucrose, and a slightly higher rate for all above that percentage.

The following is a fair example of prices under the sliding scale: Five dollars for beets containing 16 per

cent of sucrose and 30 cents a ton for every additional one per cent of sucrose, with a deduction of 25 cents a ton for every one per cent less than 16 until the acceptable minimum is reached.

Under this system it will be seen that the increment of sucrose is paid for at practically the same rate per cent as the basal price of \$5 for 16 per cent beets. Fractions of one per cent are paid at the same rate.

An example of the flat rate would be \$5 a ton for all beets testing 14 per cent of sucrose or more.

It is at once evident that any ordinary loss in weight due to a delay of one day or several days between digging and weighing is, under the sliding scale, reasonably well compensated for, and that the loss in that time due to chemical changes is practically negligible, provided the sucrose test is made from beets taken when they are delivered and weighed and not from a sample taken from the field just before or immediately after the crop is dug.

The sliding scale would probably also be fairly equitable in dealing with beets that have been piled under the

(Continued on Page 47)

A \$500,000 Gift To Users of Fortified Tires

This is an actual gift, as these facts show:

Nobody asked for better tires than Goodyear built last year. Nobody thought them possible. They were so extra-good that for years they've outsold any other tire.

And this year—on February 1st—we gave you another big price reduction. It will save Goodyear users about \$5,000,000 this year. It was our third reduction in two years, totaling 45 per cent.

This Year's Extras

Yet, despite this reduction, we have added new improvements which will cost us \$500,000 this year. Part are in extra rubber—all in extra wear.

We have added these extras to the best tires built. To tires that dominate because of super-service. And we've done it at a time when price reductions have led to considerable skimping.

Total, \$1,635,000

All the extras we give you in Goodyear tires will cost us \$1,635,000 this

year, judged by current output. These include five features which no other maker uses. It includes other uncommon features.

We could omit all these, yet build a tire which looks about like Goodyears. It would serve as well as many rival tires. Thus we could add to this year's profits \$1,635,000.

Tires Not Alike

It's a vast mistake to think that tires are pretty near alike. Five of the greatest features known are found in Fortified Tires alone. And many a tire lacks all the extras that we cite.

These extras combat rim-cutting, blowouts, loose treads. They combat punctures and skidding. They mean a secure tire. They mean more rubber, more fabric than some.

They mean more mileage, less trouble, less expense.

We pay the price to give you these extras, and save it by mammoth output. You should insist on them. Any dealer, if you ask him, will supply you Goodyear tires.

GOOD YEAR
AKRON, OHIO

Fortified Tires

Fortified Against

- Rim-Cuts—by our No-Rim-Cut feature.
- Blowouts—by our "On-Air" cure.
- Loose Treads—by many rubber rivets.
- Insecurity—by 126 braided piano wires.
- Punctures and Skidding—by our double-thick All-Weather tread.

ON THE DECAY OF ORANGES WHILE IN TRANSIT FROM
CALIFORNIA

G. Harold Powell says:

(Extracts from Bulletin No. 123 of U. S. Dept. of Agriculture,
Bureau of Plant Industry.)

"The work of three years has shown that the orange as it comes from the tree in sound condition seldom develops decay and that brushing, washing, and the mechanical injury of the fruit in handling are followed by more or less loss, the greatest decay developing in the mechanically injured oranges. . . . an apparently sound orange when it comes from the tree shows greater resistance to decay than the same fruit after it has been handled in different ways, that the fruit showing visible mechanical injury as the result of handling develops the maximum decay, and that the brushing and washing of sound oranges is more or less detrimental to their keeping quality The packing house tests indicate that an orange with a sound skin is not more likely to decay when grown in the coast region than a similar orange grown in other parts of the orange belt and that a similar line of handling produces similar results in the different regions. . . . in groves that are well fumigated the fruit is practically free from the sooty-mold fungus. . . . Oranges are washed primarily to remove the sooty-mold fungus that grows in the so-called honeydew exuded by the black scale.

. . . . When the present investigation by the Bureau of Plant Industry was undertaken, from one-third to one-half of the oranges of California were washed, practically all of the fruit in some sections being treated in this way, especially where the growers had been overconfident in the parasite 'Scutellista cyanea' or in the use of oil sprays as means of holding the black scale in check. . . . The necessity for washing the orange should be avoided by a proper fumigation of the groves with cyanide" (this of course means fumigation with hydrocyanic acid generated from cyanide). "Fumigation, on the other hand, is one of the operations that promotes good orchard management; it maintains strong, healthy trees and fruit, and it reduces the cost of preparing the oranges for market in a manner that increases the keeping quality of the fruit."

In Bulletin No. 63, of the U. S. Department of Agriculture, Bureau of Plant Industry, by A. V. Stubenrauch, under the heading INFLUENCE OF CLEANING OPERATIONS UPON DECAY, appears the following:

"Washing is perhaps the severest treatment that can be given to citrus fruits, and wherever it is not absolutely necessary in order to render the fruit marketable it should be omitted."

"CYANOFUMER"

(Trade Mark)

(Patents Applied For)

Process for the Generation of

Hydrocyanic Acid Gas

AND

Mechanical Device

for Applying the Process
in Practical Fumigation
Operations

The "CYANOFUMER" (Process and Mechanical Device) while new is fully proven and we are prepared to establish the correctness of every claim which we make in its behalf.

The "CYANOFUMER" generates and delivers Pure Hydrocyanic Acid Gas to the tents and does it with satisfactory uniformity, one charge with another.

THE CITRUS FRUIT GROWER SHOULD INSIST UPON HAVING HIS TREES FUMIGATED WITH HYDROCYANIC ACID GAS, GENERATED IN AND DELIVERED BY THE "CYANOFUMER."

Money Saved

By Using the

"Cyanofumer"

(Trade Mark)

- It eliminates waste.
- It insures accurate Dosage.
- It produces perfect chemical reaction.
- It generates pure Hydrocyanic Acid Gas.
- It delivers the pure gas under the tent.
- It removes risk of gas condensation.
- It stops loss of gas by absorption.
- It solves the problem of normal tent leakage.
- It increases fumigation efficiency.
- It saves time and labor.
- It prevents acid burning of tents.

Fruits

EFFICIENT FUMIGATION

LABOR-**SAVING** machinery makes for economy and greater efficiency. Every small boy in the country would not today be carrying a fairly accurate timepiece if hand labor were the principal factor in the manufacture of watches. Machinery seemingly almost human in intelligence has been introduced and various parts of the most delicate appliances are turned out and the human hand is employed only to assemble these parts. We recall well a remark made some years ago in effect that while practically all classes of manufactures and production excepting agriculture

have investigated the resistance of trees, effect of temperature, humidity, electric winds, the texture and holding capacity of various fabrics and methods of fabric treatment. Chemists have investigated best form of chemical from which to secure cyanogen, and today (or tonight rather) the fumigator goes to his work with almost exact knowledge of the tree's requirements.

There are still problems, however, worthy of some of the best minds. One of these is the matter of leakage. How can a fabric be secured which will be light in weight, impervious and durable? A specially woven, light weight duck is generally used, but at

Cyanofumer in Operation

had made wonderful strides the production of our food was conducted much the same as it was on the hills of Judea. But that is not true today for with the advent of gasoline and electricity the farmer is taking advantage of these forces, and the use of labor-saving machinery will increase, we believe, even more rapidly for the next half century than it has for the past. The rule of thumb and general guesswork cannot continue for if the American farmer has to compete with farmers in other parts of the world and still maintain the American farmer's mode of living he must produce more and better.

The writer vividly recalls barefoot days when, with a shallow pan in one hand in the bottom of which was a little coal oil, and a short paddle in the other, he was sent to the potato patch to "gather bugs." This was during the time when the Colorado potato beetle was failing to observe the neutral rights of the "old-fashioned potato bug." It has been his lot to fight insects from that time up to the present, and with practically every method known to the farmer. The methods employed, starting with the afore-said potato beetle, have followed all the way through the various spraying processes and the hopperdozer, down to fumigation.

Fumigation, however, in those early days, more than a score of years ago, was only just beginning to be known. First lessons were taken from Prof. D. W. Coquillett, at that time connected with the department of agriculture and making special investigations in California. Then the rule of thumb method prevailed entirely. We did our best to estimate the cubic contents of a tree. Most of us did our estimating on the general common sense and experience basis rather than an actual figuring out in feet and then having an accurate dosage scale. After a night's work in the orchard the trees were observed closely the next day and those which were burned with a five-ounce dose had their pictures fixed in the eye so far as possible, and the next night that particular size of tree received perhaps a four-ounce dose. Since then scientific people

times this permits sufficient leakage to make the difference between success and failure, this in part because of the length of time required to secure the entire release of the gas from the cyanide of sodium. The method followed has been to place the sulphuric acid and water in a vessel underneath the tent, dropping into this ounce-sized pieces of cyanide. The total time required for the complete change of these substances and the release of the gas has been from five to 15 minutes. Instead of requiring 15 minutes, if greater concentration can be secured by the release of all this gas at once, the leakage would not have so disastrous effect.

The instantaneous production of gas is now accomplished in a mechanical appliance which not only has the advantage of securing full power of gas instantaneously but has the efficiency of the perfect machine. In a word, the appliance consists of a container holding sulphuric acid and water mixed, and another chamber in which is a solution of cyanide and water. An automatic measuring device is so arranged that with a simple movement of the hand the operator is enabled to inject the proper amount of the cyanide solution into the sulphuric acid solution. But may we be permitted to quote from a more technical description:

"In the practice of this process perfect chemical reaction is obtained; there is no decomposition of the hydrocyanic acid and no loss by absorption; thus nearly the full theoretical cyanogen content of the cyanide is converted into hydrocyanic acid gas and this gas is delivered, pure and free from entrained sulphuric acid, to the tent. The generation of hydrocyanic acid gas and its delivery under the tent are almost instantaneous; this secures exposure of scale to immediate contact with the maximum concentrated strength of the hydrocyanic acid gas before there can be either gas loss from normal tent leakage or gas decomposition by air. These features practically mean a guarantee of highest efficiency in scale killing."

This appliance or machine is called the cyanofumer. It is not offered for

sale but is being manufactured in large numbers for the use of orchardists of California under special arrangement with its owner.

In any case, this machine will insure better work at no greater expense than under the former system. Better work is proved by the fact that at the Whittier experiment station, where it has been tested, it has been shown that the machine has a 98 per cent efficiency in delivering full strength of the gas. This is against a 75 per cent loss which is often the case where the gas is generated in an open vessel. The saving from the use of the machine is in both labor and material. The saving in labor may reach as high as 33 1-3 per cent. The saving in material will not be so great, but there is a direct saving in the quantity of acid used. Heretofore excess of acid has been necessary in order to convert all the cyanide and release the cyanogen. A certain excess is still necessary, but because of the method of mixing the amount required is now reduced nearly 50 per cent.

The measuring device is accurate to an extreme degree. The graduations represent solid cyanide in ounces. It is so constructed that by setting the indicator at the required dose and moving the lever up and down once, the exact quantity intended (no more and no less) is introduced into the generating chamber, and with sufficient force to secure proper agitation of the liquids in the generating chamber for instantaneous and complete chemical reaction. The generated gas is immediately delivered, hot, under the tent by its own momentum.

Tents are injured by acid carried on the gloves of operators and by acid spattered on the tents as the result of chemical action. Ninety per cent of the tent injuries are due to acid burns. With the cyanofumer there is no acid handled near the tents. This should save some of the expense which has been necessary in the employment of two men constantly on each 100-tent outfit in repairing damaged tents.

The economy well justifies the expenditure necessary in the manufacture of the machine. The first look at it convinces one that it is well made and thoroughly dependable. The chamber for holding the sulphuric acid is constructed of spun lead and antimony, a combination which is known to resist any action whatever on the part of sulphuric acid. One indication of the completeness of the device, as may be seen in the photo on this page, is the framed dosage schedule prominently placed on the top of the machine.

One hundred of these machines will be tested in California's orange groves this season. A careful inspection convinces us that the appliance will be a complete success. Besides the direct economies another matter may be referred to. Heretofore many orchardists have refrained from fumigating their trees because of the uncertainty and the expense. If the uncertainty may be eliminated and the expense reduced, more general fumigation will result in cleaner trees. Cleaner trees mean cleaner fruit; cleaner fruit means less washing and brushing; less washing means less decay; less decay means higher prices and money saved in icing.

CURVED ROADS AND PATHS

Written for California Cultivator
By Ernest Branton

OCASIONALLY we meet persons who fail to see the advisability of having curves in either roads or paths. Both are artificial at best, for nature provides none, but as straight lines are less natural than curves it is better to have the latter as nearest to nature and affording greater variety than would be possible under any scheme of planting with straight roads and paths.

Bailey stated a full quarter century ago in American Gardening that curves were desirable for three reasons "They present different views from each part; the drive is hidden from itself; one does not look ahead over a straight and monotonous driveway. The curves augment variety because they force upon one a constant

should be parallel or appear to lead to the same object.

"The nature of the curves should conform somewhat to the character of the landscape. In rough or bold grounds drives may have much bolder and more spirited curves than in tamer places."

Control of Plant Breeding

But a few weeks ago I advised the amateur to take up plant breeding if his taste ran in that direction. He was further advised not to work against nature, but to follow her dictates. Two cases in point come under observation in my own garden, with my particular hobby—gladioli.

The first generation of seedlings from crossing gladiolus primulinus with the common garden gladioli will bring every shade of color except blues and their allies. Therefore do not strive for these colors with G. primulinus. You would gain nothing

A GROVE OF COCONUTS

change of direction and position." Curves are present everywhere in nature; straight lines are not, then why not curves?

The chief argument against curves is their abuse. When they are many and pronounced they certainly are less desirable than straight lines for the latter have the merit of directness and convenience, which abrupt or widely-detouring curves have not. The fewer curves we have and the less these depart from a straight line and yet preserve graceful contour the stronger will the landscape effect be. Bailey lays down the following simple rules for our guidance:

All curves should appear to be necessary or useful. This rule really determines the whole character of the drive. The rest are corollaries to it. Avoid balanced curves—a cork-screw or snake-like motion.

The curves should be direct; their general trend in the direction of the object to which they lead. The drive should go where it appears to go.

"The successive parts should be hidden from each other by tasteful plantings along the borders.

"The branches of a drive should diverge strongly at their junction, and they should usually be wholly or partially concealed from each other by plantings or other objects. If drives diverge, they appear to lead in nearly opposite directions, and therefore have the appearance of usefulness. If the parts have the same direction, one portion appears useless. A broader statement is the following.

"No two drives, or parts of drives,

but a little satisfaction for producing the unusual if you did, for better results in blues may be obtained in other lines of breeding. Crossing with another wild species, G. dracocephalus, you will get nothing but dull reds in the first generation, no matter what the color of the other or hybrid parent. Therefore strive for reds, and if this line of color naturally breaks toward yellow or any other color, follow this natural bent but do not work against it.

Coconuts in California

The coconut palm is grown in but one place in this country, Southern Florida, and there it is not thrifty enough to give it commercial importance. The same might also be true of a few spots in California. To bear a marketable crop of nuts this palm demands more than we can supply. It should have a nearly uniform temperature throughout the year and our winter nights are too chilly. It needs an annual rainfall of about 40 inches and this should be well distributed throughout the year. In this our climate is deficient.

But, the coconut palm can endure exceedingly dry periods for a short time, strong, harsh winds, overflow and wash of roots by salt water and will live through prolonged drouths. A dry season of six months will cut down the crop one-half in the best commercial plantations, but if there is an ample supply of water at the roots, a dry atmosphere is conducive to the production of an ideal crop of nuts. On lands close to the sea or salt in-

land bodies where the roots may reach a constant water supply, the coconut palm should thrive in California. Around San Diego Bay and the adjacent False Bay and in similar positions at Santa Barbara and other points there is no doubt but the palms will thrive, though they bear no edible nuts. They are worthy of a trial.

Coconut Culture

Coconuts with husks on have sprouted while on the floors of warehouses in Los Angeles, and when planted in large pots have grown to fine decorative plants. The nuts could be planted out when well sprouted, but in our climate it would be better to keep them in pots or boxes for at least one year. When planted out they require no further care though they are just as responsive to care and plant food as any plant. But the great amount of neglect they will endure proves that we may grow them. Nuts for planting should be bought with that end in view and be unhusked.

Paying Gardens

One man will take a pound of steel and convert it into a part of a rail for trains to run upon. But another will convert it into watch springs worth many times as much as a pound of rail. So is it with gardens. One may so conduct his acre that it pays but a few dollars in a crop of squash

or pumpkins. Another may take the same acre and by well-balanced, careful, intensive culture, wrest a living from it. This is equally true of the flower garden. Last year I took from a plot of ground 20x30 feet nearly \$100 during the month of July. The crop was cut flowers, sold to a wholesale dealer in Los Angeles. It is all a matter of study and care. There is no secret or secrets about it. What does your garden pay?

It is time to begin to think of the fall bulb planting season. Daffodils, tulips and many of the other bulbs are now ready to be taken up. If dried off and put in the ground a couple of months later a wealth of bloom will result next spring.

Encourage morning glory and other vines which are growing over unsightly board piles, fences, or sheds. They are quickly and easily covered and make a thing of beauty rather than an eyesore.

Stake up the dahlias and do not allow them to drag over in the wind. Also keep down a too liberal supply of shoots. Two stalks per bulb are sufficient.

The quicker growing annuals may yet be planted in seedbed and will give abundant bloom late in the fall when flowers are scarce.

These are the days in which the cultivator and hoe should be kept in action.

TRAVEL COURSE IN CITRICULTURE

(Continued from Page 27)

after the trees are large and the roots occupy all of the space.

DETERIORATION OF CITRUS TREES

By E. U. Slyfield

One of the most striking things about citrus growing is the fact that after 20 or 25 years the trees so often begin to turn yellow, developing mottled-leaf or chlorosis and falling off in production. In most of the older districts this is now becoming a serious problem, and the growers are making every effort to bring their groves back to their former producing power.

Unless something can be discovered to make these groves productive again growers in many of the older districts will have to take the trees out.

On some ranches they are trying the mulching system. This is helping the condition of the trees, but the question at once arises is such improvement permanent or will it be necessary to keep up the mulching continuously?

If the former is true the question is probably solved, as this would be a cheap way to restore the orchards, but if the mulching was necessary permanently the story would be different. In doing this from 20 to 35 tons of mulch per acre is about the amount required. It would cost \$6 a ton under the most favorable conditions, so that the cost would be very high. This would be more than the cost of cultivation, which would necessarily be eliminated. It is now to be determined whether this extra cost would be paid for by the increase in production.

Another system which is advocated by some of the growers is a heavy application of calcium in the form of calcium carbonate. Some are trying to raise the percentage to one per cent in the first six inches of soil. Combined with this treatment a summer and winter cover crop is being grown. So far the results are undetermined, but the advocates of this system think that it will bring the groves back.

The Riverside experiment station has recently leased 20 acres of an old orange grove which has undergone this mottled-leaf depreciation. They intend to put 98 different experiments on this orchard and attempt to find the best system for treating these trees. It is probable that before long they will have some valuable data to help the growers, but until then it is a great question to know what to do.

FOUR IMPORTANT FACTORS IN CITRUS GROWING

By G. E. Geldenhuis

The fame of California's citrus-growing industry has spread throughout the world. In South Africa we are beginning to look to California for ideas, guidance and inspiration. The opportunity of spending a few weeks on this travelling course has given me a new insight into this wonderful industry of Southern California. Everything was not encouraging, but that the industry offers such vast problems kindles the spirit of pioneering and increases the fascination in the enterprise.

The first thing that impressed me—and I am not simply saying this for the sake of flattery—is the kind-heartedness, energy, open-mindedness, receptiveness to new truth, manifested by most of the growers. The citrus grower has solved many problems, climate, bad soil conditions, lack of knowledge regarding the best pruning methods, the combating of diseases and insect pests, frost protection and marketing. In general the citrus grower is only too willing to try something new. He is essentially an experimenter.

The second impression is that as a financial proposition, citrus growing is most successful as a large-scale undertaking. The Arlington Ranch near Riverside, the Chase Ranch and the National Orange Company Ranch near Corona, the Leffingwell Ranch near Whittier, the San Diego Land Corporation Ranch near Chula Vista, the Rancho Sespe and Limoneira Ranch near Santa Paula all operate at least between 700 and 1500 acres. On these large ranches there is opportunity for specialization, efficient supervision, good labor conditions, desirable experimentation, adequate handling and distribution of the fruit.

A third impression that forces itself upon me is the difference in opinion that exists as to the best treatment for the orchard. One farmer dynamites his soil; another tries a peculiar system of cultivation; a third believes that you should not cultivate at all, but apply a mulch; a fourth that bud selection is most important; a fifth that a peculiar kind of pruning will solve the problem. One farmer holds that the tree should obtain its food close to the trunk, another that the "tree should work for its food" and the food material should be in the middle of the row. Very often experimentation is carried on in a very haphazard way. As soon as somebody comes along with a new idea, instead of first trying out this new idea in a scientific way on a small plot with the adequate checks, a whole orchard is treated.

A fourth truth which has dawned upon me is that for the greatest success in the citrus industry there must be a perfect correlation of all the factors. A man must consider the right location for his orchard, he must have a large ranch if he thinks of making his enterprise a financial success, he must study his soil, select his trees, work for the comfort of his laborers, experiment scientifically with fertilizers, mulching and pruning, handle his fruit carefully, pay special attention to grading, packing, transportation and selling.

The Limoneira Ranch near Santa Paula illustrates to a fine degree the perfect correlation of the four factors just mentioned, namely, efficient management; large size; scientific experimentation; and perfect organization.

The attachment of a little card with the number of the picker to every box serves as an example of the efficient management. By this means the number of boxes picked by each man as well as the quality of fruit and the manner in which he picks them can be ascertained at any time. The size of this ranch is about 1200 acres and consequently it is large enough for efficient use of man labor, machine labor, and the conduct of a separate packing house, the second largest in Southern California.

There is a good deal of experimentation amongst citrus growers, but too many depend too much on their memories, apply their experimentation to too large areas, do not provide sufficient checks and consequently suffer losses and obtain poor results. Some very interesting experiments have been and are being conducted on the Limoneira, of which the following are a few:

It has been found by keeping accurate record on one acre of Lisbons that 112 trees per acre give a higher production per acre than 56 trees, and consequently a good deal of double setting is being done.

Removing the wrappings from buds as early as the 12th day has given very satisfactory results.

Throwing sulphate of ammonia, one pound per tree, in the irrigation furrows near the tree and allowing the water to carry the sulphate into the soil is being tried out. Chemical tests of the water a short distance from where it has passed over the sulphate indicate that most of the sulphate sinks into the ground near the tree.

A fertilizer experiment, where ten rows have been treated with sulphate of ammonia, ten rows with blood and ten rows with nitrate of soda, with adequate checks between where nothing has been applied, shows a distinctly healthier green coloring of the foliage in the treated rows. The rows in which sulphate of ammonia has been applied seem to possess the richest green color.

The Limoneira is really getting some definite and valuable results by the application of scientific methods.

The various units in the organization of the Limoneira Ranch interlock to perfection, thermometers in various parts of the orchard indicating the temperature during the cold period, 50,000 heaters ready for any emergency, a large packing house, capacity 130 cars, with modern methods and equipment, the handling of the fruit through the California Growers' Exchange, all give evidence of the best kind of organization.

The Limoneira is a fine laboratory for demonstrating what several of the other citrus ranches corroborate, that efficient management, a sufficiently large-sized ranch, scientific experimen-

tation and perfect organization of the various factors are necessary for the commercial production of citrus fruit. Given the right man, a good sized

farm, rational experimentation, an adequate correlating system, the citrus industry in Southern California is as safe as any other investment.

Cultivate with a "Baby" Creeping Grip Tractor

Here's the tractor that you have been looking for to handle your ranch work.

This Baby Creeper was designed for the small rancher, particularly the fruit rancher. It delivers 16 Brake and 10 Tractive H. P. and does the work of 6 good horses or mules.

It is low, gets under the trees, turns in its own length, its fuel consumption is very low and it does not require an expert operator

Phone F3626

The Phone for My Home

WITH a Kellogg Telephone in your home, you are ahead of trouble and losses that come when sudden illnesses develop or long trips are taken to town only to find the markets gone to pieces.

The man with the good telephone in the house is in quick touch with the voice of the entire world. In a minute he knows the markets. In case of fire, tramps or illness, he can call the whole community. If he has an orchard and the fruit ripens quickly, he can scour the country for help in harvesting. The whole community becomes a living thing to him and that old dread of country life—isolation—is gone forever.

Kellogg Telephones End Telephone Troubles

They are made in the largest independent telephone factory in the world, and have to undergo the most rigid inspection for quality ever devised. 37 distinct tests given every instrument before it is O. K. for shipment.

You may find that Kellogg instruments cost slightly more than ordinary ones. But a huge trade has been built on them all over the world because they do away with repair bills and because after years of service the voice is transmitted as clearly and plainly as when they are new. Just the other day a customer wrote us that he had a Kellogg phone in service fifteen years.

The instrument shown here is Kellogg Favorite. Less wall space, stronger ring, reliable lightning arrester. Standard, unbreakable receiver and mouthpiece, secret service push button to ring "Central" without calling neighbors.

Send in your name and address and we will put you on our telephone bulletin list. Let our expert department help you in your telephone troubles. Get free the kind of information that will save you money. Write for Bulletin 24.

GROWING ONION SETS IN CALIFORNIA

Written for the California Cultivator
By H. R. Mitchell

THE growing of onion sets in some sections has reached such proportions that it is considered quite a separate issue of truck farming. Not only this, but in the location where thousands of bushels are grown each year they are not favored with a very long growing season such as we have here in California, yet they make a success of the business.

Location

It is not hard to find a favorable location for growing onion sets as their main requirement is suitable soil. Onions prefer a moderate temperature. They are rather adverse to extremely hot locations unless there is a large supply of water applied to the soil in combination with careful and continual cultivation. The culture of onion sets has been successful both on uplands

and coast country in California, and some of the valleys have produced satisfactorily.

Soil

Onions resent a poor soil. Therefore a soil must be selected that is capable of responding to cultivation by working up into a mulch. This does not necessarily mean a loam soil because a quite heavy adobe can be made to do, though it will require a good deal of work to place it in good tilth, and bear in mind that if a barnyard fertilizer is to be used it should be placed in the soil long before planting time that it may be well decomposed before the seed is placed in the soil.

The ideal soil for onion sets is of sandy loam character. This is preferred because a top soil mulch is more easily produced. This is an essential factor inasmuch as it helps greatly to retain the moisture in the soil. Did you ever take a piece of lump sugar and place on top a small quantity of powdered sugar and then place all in about one-eighth inch of water?

Slowly the water will progress up the cube, and when it reaches the powdered sugar it practically stops. The particles are too far apart and the water finds difficulty in rising through it. This same action takes place in the soil where the under part is firm and there is the proper mulch on top. That is why a sandy loam or any soil responding properly to cultivation is preferred.

Time to Plant

Sometimes the early crops are sown during December and January, and planting will continue up till June. For the early crops White Bermuda are good and for fall harvesting plant New Queen and Australian Brown.

Planting

After thorough preparation of the soil or seed bed seed are generally drilled in at the rate of from 50 to 70 pounds per acre. They are allowed to grow thickly because the sets are harvested when about marble size so do not require a great deal of room. The depth to plant the seed depends largely upon the soil, varying from one-half inch on a heavy adobe to one inch on a light sandy loam. The seed should be planted in what is called double or triple rows, that is two or three rows one inch apart, then the distance from one double or triple row to another can be decided by the method of cultivation used. Probably cultivation by horse will be preferred, so that rows should be from 24 to 30 inches apart. After seeding thorough shallow cultivation is essential.

Growing

Naturally it will be necessary to keep all weeds down during the growing period. This again calls for cultivation. The soil should be watched closely to ascertain moisture conditions. It is not necessary to keep the soil soaked. The constant working of the soil will be the one big factor in maintaining the condition of the soil that is desired. When the tops of the onions are six to eight inches high and about pencil size at the crown of the plant they will be nearly ready to harvest.

Harvesting

Examine the sets carefully to see if they are about marble size. This is the most marketable size and when thoroughly graded you will find them by far the most saleable. Have lath trays made in which to cure the sets in the field. These should have solid sides and ends but just strips of lath on the bottom. Make them 36 inches long, 24 inches wide and from four to five inches deep. Take these trays into the field and place them along the rows. Now you are ready to pull the sets. They are pulled by hand and the dirt knocked from the roots. Throw them into the tray about two layers deep and leave the trays in the field until they are thoroughly cured, when the tops easily break off and leave your sets all ready for grading.

Yield

The yield of onion sets per acre varies with location. Five tons per acre is the average, and as high as seven to nine tons per acre is sometimes obtained where a succession of crops is grown.

CANNING VEGETABLES IN THE HOUSE.

It will soon be the time of year when our gardens will be in their prime. The question which will confront the housewife is "Will we can vegetables in the home?" thereby saving the garden products, or "Will we waste this material that might be canned to such good advantage?"

Many people have trouble in canning peas, beans and corn. This trouble may be overcome by thorough cooking. One very satisfactory way is as follows:

Select young and tender vegetables, pack firmly in the jar, cover with cold water and add a teaspoon of salt to each quart. Put on the rubber and top and steam for five or six hours in a boiler or steamer. A boiler may be used in place of a steamer if a false bottom or rack is used to keep the jars from the bottom of the boiler.

In the high altitudes about one-fourth more time must be added to the time given in low altitude recipes.

(Continued on Page 47)

in front of the cultivator

Four and one-half pounds to the square inch in the Model 18—five and one-half pounds in the Model 12 is the pressure per square inch on the treads of The Yuba Ball Tread Tractor.

Think of what that means in cultivating an orchard or vineyard or hop-field. It packs the soil less than any other tractor, a horse or a man.

It is in this type of work that the value of its strong, light weight, steel construction is most convincingly shown.

The low pressure per square inch on the treads is gained by distributing the weight of the tractor equally over a large area.

The Ball Tread design gives this low pressure without reducing its tractive grip on the ground. In fact—it increases it.

There are many other uses and many other features. There is a booklet in which they are explained.

NOTES ON THE DUTY OF WATER

Written for the California Cultivator
By Sacramento Valley Contributor

A PROBLEM that will become more important and more interesting from year to year is how to secure the greatest possible tonnage of crops by the use of a given quantity of water. The farmer who can so manage his affairs and work and cultivate his soil that an acre-foot of water will produce as many bushels of grain or as many tons of hay for him as one and one-half or two acre-feet of water will for his neighbor is not only benefiting himself, but is a benefactor to the community, the state and the nation.

An acre-foot of water, or the amount

the soil a good soaking and provide moisture for deep-rooted plants than when a light irrigation following a good season of winter rain will maintain that optimum moisture condition. A first-class irrigation water supply must provide sufficient for the season of the greatest need.

In the Sacramento and San Joaquin Valleys it is important to give the soil a thorough irrigation in the early spring when water in the streams is plenty. In this way it is possible to increase the acreage that can be irrigated from a stream source and at the same time provide a fairly large total amount of moisture. Too many irrigators wait until well into the summer to begin to use water. And al-

POWER STATION, ROOSEVELT DAM

The Irrigators of the Salt River Valley Have a Great Asset in Water and in Power. Their Power is Secured by the Fall from the Dam at a Cost Which is Merely Nominal.

required to cover an acre of land one foot deep, is really a considerable quantity of water, being 325,850 gallons, or 43,560 cubic feet, the weight of which is 1356 tons.

The amount of water per acre provided by various irrigation districts and companies varies from one to five or more acre-feet per year. The actual need for supplying the moisture necessary for maximum crops varies greatly with the seasons, the crops and the character of land to be irrigated. The requirement the second of two dry years when there is so little rainfall that it does not penetrate deeply enough to "connect" with the lower strata of moisture in the sub-soil is much greater in order to give

most every one should cultivate more—and irrigate less.

There is only one way to determine whether a farm is making money and that is to keep farm accounts. If these accounts are to show not only the total farm profit or loss, but also those factors that made for the final result, then the accounts must embrace every phase of the farm industry and show just where money is being made and where it is being lost.

Pleasant home life is very essential for business success. This is especially noticeable with the business of farming. It requires pleasure that is fostered by cheerfulness to make farmers do their best work and most important thinking and reasoning. It would pay most people to study a little how home life can be made more cheerful and pleasant.

He that turneth from the road to rescue another, turneth toward his goal; he shall arrive in due time by the footpath of mercy, God will be his guide. He that taketh up the burden of the fainting, lighteneth his own load; the Almighty will put his arms underneath him. He shall lean upon the Lord. He that speaketh comfortable words to mourners, healeth his own heart; in his time of grief they will return to remembrance, God will use them for balm. He that careth for the sick and wounded, watcheth not alone; there are three in the darkness together and the third is the Lord.—Henry Van Dyke.

John Deere
Farm Implements

John Deere Implements

A New Book
Free

Just Off the Press

Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions. It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements: Steel plows, cultivators and harrows; corn planters, disc harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side delivery rakes; motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasoline engines.

To get this book free, state what special implements you are interested in and ask for the book as Package No. X-111.

Van Brunt Single Disc Grain Drills

Van Brunt Drills plant any small seed from alfalfa to bearded oats, corn and peas exactly where it will bring the best results—at the bottom of furrows of uniform depth. All the grain is up and ready for harvest at the same time.

No seed is wasted, all the field sown. Van Brunt Drills have an adjustable gate force feed which compels an even, continuous flow of seed from each seed cup without bunching or cracking the seed. It cannot choke up.

The seed is planted at uniform depth. It beats the dirt. Individually adjustable pressure springs can be made to force discs to cut furrows even depth. Seed is conducted from hopper to furrow opener by metal tubes and there protected from dirt until it reaches bottom of furrow.

The "Light Draft Drills"

Van Brunt Drills are so called because they are light weight, well balanced and yet so strong that they work entirely satisfactorily under difficult conditions.

No stub axles are used—none required. Simplified construction makes Van Brunt Drills easier to operate.

Main axles are continuous. Drills are gear driven direct from axle. Each wheel drives half the feeds, insuring smooth running.

Hopper is extra large, well braced and has tight fitting two-piece covers. It does not sag.

Disc bearings guaranteed. They will last lifetime of

drill. Disc blades are high grade steel kept absolutely clean by spring steel scrapers.

Grass seeder attachment can be furnished for any Van Brunt Drill. It will sow broadcast or drill, as desired.

Write for free booklet "John Deere-Van Brunt Single Disc Drills." It explains why you will get the biggest yield by using Van Brunt Drills.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

DRY FARMING CONGRESS

A letter from Secretary Faxon of Denver calls attention to the fact that there will be over 20 states represented in the interstate building at the soil products exposition which will be held in connection with the tenth annual dry farming congress in Denver, September 26 to October 10. The secretary predicts that every state west of the Mississippi will be represented by a separate state display. Colorado will doubtless make the most extensive display.

AMERICAN POMOLOGICAL

The annual meeting of the American Pomological Society will be held in San Francisco, September 1 to 3, 1915. Eastern pomologists will come by special trains from St. Louis and Kansas City. These will be made up of special cars, one from New York and New England, one from Washington, D. C., and one from the neighborhood of Columbus, Ohio. Other cars will be made up as the needs demand. There will be sightseeing side trips to the Grand Canyon, the citrus orchards and other sections of Southern California and the San Diego exposition.

SAFE FOURTH

Another safe Fourth has passed to the satisfaction of the older ones and to the dissatisfaction of the youngsters who have been in the habit of celebrating with much noise. In proof of the advisability of a sane Fourth its friends are calling attention to the fact that in 1903 there were 417 cases of tetanus from Fourth of July injuries, also that during the past 12 years 42,786 persons have been killed and injured in these celebrations in

this country. We like the enthusiasm that comes from the bigger racket, but possibly the safety of our people is worth more than the enthusiasm.

SHORT COURSES

The college of agriculture is mailing its announcements of the farmers' short courses which will be given at the University Farm at Davis, October 4 to November 24. There will be courses in general agriculture, dairy manufactures, horticulture, deciduous and citrus, tropical fruits, and olives. There will also be a course in poultry husbandry. All courses are free to residents of California. Many Californians have taken advantage of this opportunity and are today doing better farming because of them. Everyone who can arrange his time so as to be at Davis during these few weeks should do so.

TOURING AMERICA

The American Automobile Association writes of the greatest touring movement this country has ever seen. This is because of two factors; one the educational "See America" and the realization that America affords abundant scenery, and the other the European war which proves discouraging to travel over the Atlantic. In addition we believe we are safe in saying that California's two expositions are another factor in determining much home touring. There have been many parties which have crossed the continent in autos. We are pleased that California's good roads campaign has added much to the pleasure of these visitors.

BIG FRUIT CROP

The review of crop conditions recently issued by the department of agriculture shows that compared with the ten year average peaches will this year produce 128.4 per cent of a crop. Practically all of the fruits are estimated to have far above average crop. Apples are estimated at 106.4, pears 105.3, blackberries and small fruits 103.1. The United States is prepared better than ever before to feed the world. Best of all, the one state in the Union which stands above all others is California. Compared with the ten-year average California's general and crop condition is 112.8. Many of the states fall below this ten-year average. California's closest competitor is Kansas with 112.1 per cent. Nebraska comes next with 111.2. Most of the others fall around the 100 mark, with Vermont the lowest with 93.6.

BARLEY PORK

Experiment station work in various states and investigations followed up by the bureau of animal industry of the department of agriculture have shown conclusively the value of barley as a pork producer. One hundred pounds of barley is not equivalent to 100 hundred of corn or wheat as to quantity of pork produced, but one thing has been proven, and that is that the best pork in the world is made from barley fed hogs. In Great Britain and northern Europe barley takes the place of corn entirely for pork production, producing finer quality, both as to hardness and flavor.

California has been somewhat backward in the production of pork. It has been almost invariably explained that "California is not a corn state and never will be a pork producing state," but if the best pork on earth is produced by barley and California

is the biggest producing barley section in the world, why should there not be a combination which would make this state noted the world around as the producer of the finest bacon and other pork products?

SAVE THE WASTES

More than ever before are the fruit growers studying the question of wastes in orchard and packing house. The old-time method of keeping hogs for using up some of the wastes of the orchard is receiving some attention. But there are more valuable products that can be made of orchard products than pork, and we believe the time will come when the margin of profit will be determined by the facilities for handling wastes. Ordinarily these may be secured only by uniting with one's neighbors, though in some communities private capital is solving the question.

Another case in point is that of Mr. Kingsbury at Redlands who at his plant manufactures California fruit and vegetable products, giving employment to many people and saving material which would otherwise be used simply for fertilizer, or even worse, be dumped into the wash. In looking over the products of this one institution one sees that they cover orange and lemon peels, citrate of lime, essential oils of lemon and orange fruit pastes, fruit salts, in all 48 different products.

Every year California loses millions because of low grade fruits or overproduction or quickly perishable products. The cannery and the dryer have saved much of this waste. We need an extension of effort along these lines.

THE CITY FARMER

Scarcely a week passes, and some weeks scarcely a day passes, that some Easterner who has spent most of his life behind the counter or in some profession calls at the Cultivator office and asks as to the advisability of his settling in California and taking up the calling of fruit growing or of farming. Only a day or two ago one of these, a remarkably bright gentleman whose life had been spent behind the counter called. He would have, after remaining in California a few weeks longer looking about for a suitable location, approximately \$3500 with which to purchase a farm, equip it, build a home and keep his family until the farm was paying. Where would be the best place for him to settle, and how should he proceed that his little capital might be best secured? His sole farming experience had been the keeping of a few hens in the backyard. He was born in the city and had never left it.

If it were not for the fact that we have seen similar ventures result successfully such an incident would only give a headache. Even then it appears to us that the chances against his success are great. Many city people have an idea that all that is necessary to secure a competence on the farm is for them to have the wherewithal to buy the raw land. It takes time; it takes capital; it should take experience to fit up a place, even in productive California. We Californians have been wonderful advertisers, and many Easterners are taking us at our word and have come here to prove the statements we have made. Californians should be very careful in writing Eastern people who have no knowledge of farming regarding the great opportunities of this section.

Agricultural Notes

Our exports of wheat and cotton have fallen off heavily during the month of June.

The olive shortage in the new crop in the Bierut, Syria, district is estimated at 25 per cent compared with last year, reports Consul General Hollis.

The pink boll worm of cotton is a very serious pest in practically all the cotton growing districts of the Old World and it is also established in the Hawaiian Islands.

Although egg imports into the United States are increasing, a 400-case shipment of American eggs was received last month at Sydney, Australia, from San Francisco.

The wheat crop of New South Wales, Australia, will be 3,000,000 bushels below estimate, the result of extremely dry weather which reduced the yield per acre and also necessitated the cutting of some wheat for fodder to feed starving stock.

The Holstein Friesian Association of America last year paid out \$4,919 in prizes at 25 fairs. At its annual meeting held the first of June at Syracuse, New York, all the old officers were reelected. The secretary is F. L. Houghton of Brattleboro, Vermont.

The American Royal Live Stock Show will this year be held at Kansas City the week of October 4-9. Arrangements have been made with the railroads to forward the San Francisco Exposition exhibits at the close of the American Royal on solid special trains operated on passenger schedules. The live stock show at the Panama-Pacific opens October 18.

A recent publication of the Japanese foreign office states that 358,711 Japanese subjects were reported as living abroad on June 30, 1914. In the United States (proper), 80,773; Hawaii, 90,808; Philippine Islands, 5,179; Guam, 119. This gives the United States and its possessions half the Japanese residing outside their own country. Canada has the next largest number with 11,959.

In all the principal plazas and gardens of Seville, Spain, in the summer time, moving picture screens are erected and small tables and chairs set out, the exhibitors either making their profits from the drinks sold or by rental of chairs at two cents each. Thousands of people go nightly to the different plazas and gardens, and the entire life of the city for about four months centers around these moving picture shows.

The International Association of Sugar Factories estimates as follows the reduction in European beet-sugar acreage for the coming season: Austria-Hungary, 35.1 per cent; Germany, 31.9 per cent; Holland, 16.3 per cent; Bulgaria, 21.3 per cent. Italy's acreage will show an increase of 37.3 per cent. The beet cultivation of Belgium is placed at 74,131 acres, a decrease of 44,479 acres, and that of Russia at 2,159,692 acres, an increase of 66,718 acres.

The department of agriculture keeps up a special motion picture factory at which it makes the films it uses in promoting scientific farming. Thus the bureau of animal husbandry had a special film to show Southern farmers how to make and use the dipping vats that would free their herds of ticks. It also showed films that illustrated the correct ways of handling meat, breeding cattle, and raising poultry. The good roads division and the forest service have made a similar effective use of motion pictures

Agricultural News Notes

of the Pacific Coast

Northern California

During last month 2,000 bales of Sacramento hops changed hands.

Members of the Little Lake farm bureau of Mendocino County held an all-day meeting and picnic at Baechtel's grove on July 4.

Growers of Nevada County expect to make a business of seed potato growing as their potatoes are so far free from disease of any kind.

Prune orchardists of Gridley, Butte County, are sending for colonies of lady bugs from the state insectary to fight the aphids in their fruit trees.

The Palermo Land & Water Company has been ordered by the state railroad commission to sell water to owners of all lands whose deeds call for it.

The asparagus business of the Marysville section of Yuba County has increased 300 per cent in the last year, according to figures compiled by the various freight offices.

Warden Johnson of San Quentin is urging rice growers to send in orders for rice bags at once. He reports that all bags on hand are sold out and that he is only taking orders for future delivery.

County Horticultural Commissioner Earle Mills of Butte County states that the orange crop will be light this year, possibly 75 per cent of normal, but that indications are for over a 100 per cent crop of olives.

The university farm at Davis has loaned its milk testing apparatus to the Sacramento Valley exposition exhibit at the Panama-Pacific. A student of the university farm is demonstrator in charge.

The award of the grand prix in the international contest on dried apples, including a gold medal, at the Panama-Pacific International Exposition, has been made to Oda Brothers of the Sebastopol district.

The rice crop of the Gridley-Biggs-Richvale region of Butte County is reported as only about 60 per cent of normal on account of the cold spring which caused a great deal of the seed to rot in the ground.

The Santa Rosa Cured Fruit Association has cleaned up all the 1914 crop and has already sold ten carloads of this year's prunes. Estimates place the stock yet remaining as between 30 and 40 carloads.

Orland and surrounding sections of Glenn County have been suffering from a pest of grasshoppers. Grasshopper catchers which have been successfully used by government experts in fighting the pests are on exhibition at Orland.

The board of supervisors of Shasta County has voted unanimously to assist the farmers of Hat Creek Valley to open Big Springs, their main supply for irrigation water. The spring was filled by mud flow from Mt. Lassen.

Redding, Shasta County, is planning for a big fair in September. Trinity, Siskiyou, Modoc and Lassen Counties will join with Shasta in the fair. The exposition's name is The Northern California Exposition Live Stock, Agricultural, Poultry, and Mineral Show.

Central California

The Tulare County cannery started work on apricots on June 16.

The Hanford cannery will not make any run this season on apricots.

The California Winery Association has cancelled all grape contracts.

The San Joaquin Valley Sugar Company opened its mill on July 2 at Visalia.

The Associated Raisin Company has issued a new price list on holdover raisins of the 1914 crop.

The green fruit season is in full swing in Tulare County. Canneries announce that they will run full shifts.

Orchardists of Kings County are considering a proposition to pool the peach, apricot and prune crops of the county.

Between four and five sections of dry feed were burned over by a fire in the Deer Creek district of Tulare County.

Contracts have been closed for the sale of 5000 tons of alfalfa, which is to be shipped from Porterville via Panama Canal to New York.

Pomona Grange of Tulare County held its regular quarterly session at Dinuba June 10. The next session will be held at Tulare September 9.

A shipment of California dried fruit aboard the steamer Portland has been seized by the British government and is being held at Kirkwald, Scotland.

A movement is under way in Tulare to organize an association of local fruit growers to take advantage of the market provided by the California Growers' Association.

Green fruit packers of the Fresno district, it is reported, have decided to handle very few peaches this year. Most of the growers, therefore will be compelled to dry their fruit.

The Tulare cannery operated by the California Growers' Association is putting up between eight and ten tons of apricots a day, according to General Manager Vernon Campbell.

Citrus growers of Lindsay, Tulare County, recently listened to an address on fumigation for destroying gray scale by Prof. H. J. Quayle of the Riverside Experiment Station.

The Zante Citrus Association of Tulare County has chosen the following directors for the coming year: Wood Sandidge, H. A. Jones, S. S. Hough, E. A. Marshall, E. E. Graham, W. J. Davis and J. F. Canty.

The Central California cannery has already contracted for 3000 tons of peaches. The cannery will probably open on the 15th of July with between 500 and 700 people on its weekly payroll.

Members of the American Seed Trade Association took an automobile trip from San Jose through the great seed farms of Santa Clara County June 25 as one feature of their convention.

The newly organized Cupertino Fruit Growers' Association has been offered a \$25 a ton price for canning apricots. This offer was refused, all members declaring that they would prefer to dry their fruit unless they could get at least \$35.

Southern California

Sericulture is urged as a future industry for the Palo Verde Valley.

A big addition is being built to the David Hewes orange packing house at Orange.

Shipments of navel oranges are practically ended and Valencias have the market to themselves.

There is an acreage of about 1,200 planted to beans in the Buena Park district of Orange County.

The only orange packing house to have a forewoman instead of a foreman is that of the Covina Heights Growers, which is in charge of Miss Agnes Walsh.

One hundred members of the Covina Farmers' Club enjoyed their regular monthly meeting and picnic at the citrus experiment station at Riverside on Saturday, June 19.

Farmers of Perris, Ethanac, Menifee, Lakeview and Moreno, in Riverside County, are endeavoring to get together in an association to secure the services of a farm adviser.

John Arneill of Camarillo has been selected by the Ventura County farm bureau to revise the proposed hog cholera ordinance and put it in shape for presentation to the board of supervisors.

W. F. Herbert of Nordhoff has been chosen by the directors of the Ventura County farm bureau for the position of squirrel inspector. This position was created by county ordinance this spring.

The San Dimas Lemon Association at its recent quarterly meeting spent some time in discussion of daylight fumigation. A resolution was passed asking the state experiment station to investigate along this line.

Preparations for the Sixth National Orange Show to be held in San Bernardino February 17-24, 1916, have been started on an extensive scale. F. M. Renfro of San Bernardino will again be general manager of the show.

The Blythe chamber of commerce has asked the senate committee on rivers and harbors to visit the Palo Verde Valley. The members of the chamber hope to get a government appropriation to aid in river protection work.

The Sugar Beet Growers and Manufacturers' Educational Association, recently organized for the mutual benefit of farmers and manufacturers by co-operation with the bureau of plant industry of the United States department of agriculture, met in Oxnard June 26.

At Brawley, in Imperial County, there meets every afternoon the cantaloupe cabinet, whose business it is to distribute the valley's shipments of cantaloupes to all parts of the United States. This cabinet is presided over by O. W. Schleussner, market assistant of the United States department of agriculture.

The citrus station committee which had in charge the purchasing of the new experiment station site at Riverside has received from the board of regents of the university the full amount of the purchase price, and the university has now acquired 471 acres of land on the slope of Box Springs mountain near Riverside.

The Coast

Hog cholera is stated to be causing great losses in the Yuma district of Arizona.

A shipment of 2000 Sonora cattle went through Nogales recently, bound for Montana.

Members of the Spokane Poultry Association have decided not to hold the usual December show this year.

Fifteen hundred head of steers were shipped from Silver City, New Mexico, last week at an average price of \$35.

Multnomah County, Oregon, will receive \$12,648 of state money for its county fair, to be held September 14-19.

Live Stock Inspector Larson of Globe, Arizona, estimates that the cattle shipments from Gila County this year will run over \$1,000,000.

Directors of the Cascade International Live Stock Show are making plans for the big show which will be pulled off in November at North Yakima, Washington.

Twenty-five hundred persons were served at an open-air barbecue at Corvallis, Oregon, at which farmers of Benton and Linn Counties were entertained by merchants of Corvallis.

Manager H. Q. Robertson of the Maricopa County (Arizona) Fair at Mesa is anxious to have entries made as soon as possible so that space may be arranged. No entry fee will be charged.

Arizona railroads have announced that they will charge shippers cost of cleaning and disinfecting cattle cars, as required by federal regulation. This charge amounts to \$2.50 for single deck and \$4 for double deck cars.

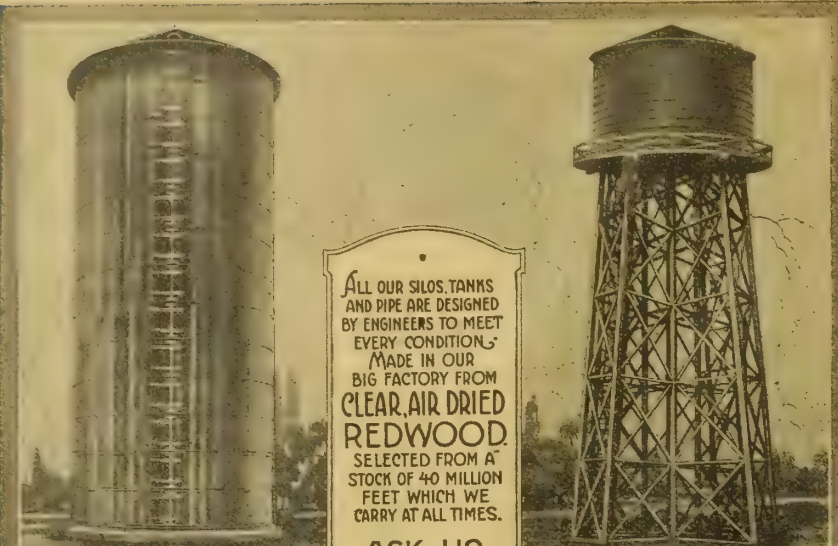

Subscribers to the \$25,000 California bridge fund for the Colorado River bridge at Yuma are going to get their money back. The last California legislature appropriated \$25,000 to reimburse the subscribers and the money is now available.

The board of Trade of Higley, Arizona, will in future hold its monthly meetings with the farm adviser. The next meeting will be held on Friday, July 23, and will be addressed by Prof. Enger, irrigation specialist from the University of Arizona.

The Farmers' Union of Chandler, Arizona, and the chamber of commerce held a rousing joint meeting Thursday, June 24. Farm Adviser Armstrong of Maricopa County was present and told how to increase the yield of alfalfa seed.

The University of Arizona is in the market for two good Jersey cows to be added to the university herd and used for demonstration and show purposes. Anyone having suitable stock will do well to write to Director R. H. Forbes, Tucson, Arizona, describing the cows offered, giving registry number and price wanted.

For the purpose of selecting a site for a government experiment station M. A. Carlton, head of the division of cereals, is visiting the district along the Columbia River west of Spokane. Government funds have already been appropriated for the securing of the site. The principal work of the station will be to improve wheat.

ALL OUR SILOS, TANKS AND PIPE ARE DESIGNED BY ENGINEERS TO MEET EVERY CONDITION. MADE IN OUR BIG FACTORY FROM CLEAR, AIR DRIED REDWOOD. SELECTED FROM A STOCK OF 40 MILLION FEET WHICH WE CARRY AT ALL TIMES.

SILOS
BUILT FOR YOUR PARTICULAR NEEDS. EXACTLY AS YOU WANT THEM. ALL SIZES AND DIMENSIONS.
16 x 36 REDWOOD STAVE SILO MANUFACTURED BY US FOR THE PANAMA-PACIFIC INTER-NATIONAL EXPOSITION, SAN FRANCISCO, 1915

TANKS
BUILT TO ORDER, TO SUIT ALL USES AND USERS. CHEAPER THAN METAL TANKS. LAST LONGER. WON'T RUST. CAN BE TAKEN DOWN AND RE-ERECTED WITHOUT DAMAGE. CAPACITIES, 500 TO 500,000 GALLONS. TOWERS INCLUDED IF YOU WANT THEM.

PIPE
MACHINE BANDED OR CONTINUOUS STAVE—FOR WATER SUPPLY—IRRIGATION OR POWER. CHEAPER THAN ANY OTHER PIPE OF EQUAL SIZE OR CAPACITY. LONGER LIVED THAN ANY METAL PIPE EXCEPT CAST IRON.

1604 Hobart Building, San Francisco

Live Stock and Dairy

CALIFORNIA IS SEVENTEENTH STATE IN PRODUCTION OF PERCHERONS

By Wayne Dinsmore, Secretary Percheron Society of America

CALIFORNIA stands seventeenth in the United States in Percheron breeding. During the fiscal year ending October 31, 1914, California breeders recorded 77 American bred colts in the Percheron Society of America. This number was recorded by 24 members who registered a total of 76 head and by one non-member who recorded one animal.

The majority of the animals registered during the time specified were colts foaled in 1913, although the figures include some produced in 1912 and some in 1914.

Percheron breeders in California who have registered their animals are as follows: In Alameda County, Wm. Bond; Butte County, Friesleben Estate; Fresno County, J. J. Schrock; Imperial County, California-Mexico Land & Cattle Company; Lake County, O. C. Thompson; Lassen County, Wm. Brockman & Son; Los Angeles County, Elliott-Brant Rancho, August Freese, E. R. Maier; Mendocino County, J. C. Johnson, J. L. McCracken; Modoc County, J. L. Harvey, T. M. Harvey; Riverside County, F. L. Hall, A. J. Stalder; San Bernardino County, R. L. English; San Francisco County, Whitehall Estate, Inc.; San Joaquin County, F. I. Hodgkins, H. G. Learned, E. Miller, C. A. Peninger; San Luis Obispo County, California Polytechnic School; Santa Clara County, O. Jenkins; Ventura County, G. J. Read; Yolo County, H. P. Eakle, Jr.

Percheron Prospects

The most extraordinary conditions that have ever confronted American Percheron breeders prevail. Importations have been wholly stopped since August, 1914. Export trade in horses has grown to numbers and values never before realized. Prices on horses have suffered less than on any other class of live stock. The general depression in business which has prevailed since the war began has not been sufficient to prevent an increased demand for Percherons with rising prices on the best.

Draft Horses in United States

About eight or nine thousand American bred Percherons are now annually produced and recorded. The registration of pure bred draft horses of the other draft breeds; Clydesdale, Shire, Belgian, French Draft and Suffolk, amounts to approximately 4000 animals annually, so that only 12,000 or 13,000 pure bred draft American bred horses are being produced annually and recorded. As the sex runs about half and half this means that but approximately 6000 pure bred draft stallions of all breeds are now being produced annually. This is a small number in proportion to the 23,000,000 horses owned in the United States, and it is inevitable that prices must rise on good pure bred sires of any breed.

Foreign Trade

The marvelous gain in exports of horses is the most marked development of the general trade. Total exports of horses from the United States to other countries (per data supplied us by the United States board of foreign commerce) amounted to but 8060 head, valued at \$1,286,369, for the last five months of 1913. During the last five months of 1914 exports totaled 78,799 head, valued at \$15,439,604, a gain of more than \$14,000,000. Tabulated, our exports by months for the last eight months are:

EXPORTS 1914 AND 1915

Month	No. head horses	Value
August	804	\$ 96,706
September	7,146	999,287
October	12,091	1,918,433
November	28,071	5,034,353
December	30,687	7,390,845
January	34,643	7,779,395
February	36,960	9,253,787
March	33,694	8,688,974
	184,096	\$40,561,760

Prices Widening

The sales, both public and private, in the last four months show a great improvement in the discrimination exercised by buyers. Animals of approved conformation and soundness have been much sought after, and higher prices have been paid for such animals than were paid a year ago. Percherons of faulty conformation, lacking in size, or unsound, have not been in demand, and very low prices have been paid—less than similar animals brought last year. Good Percherons are from \$75 to \$100 higher, and inferior ones from \$100 to \$200 lower. Such keen discrimination is a favorable sign and promises more rapid improvement than has occurred heretofore.

A Warning

The keener judgment manifested by purchasers carries a warning to breeders. If profits are to be expected from future operations good sound sires of A 1 type must be used, and the colts must be liberally nourished from birth until matured or sold. Grain should be given by the time the colts are a month old and should not be discontinued, summer or winter, until the animals are at least three years old. The superior development of the French colts, as compared with most of those reared in this country, is directly traceable to the fact that the French feed their colts grain while they are on pasture even where the grasses are unusually abundant and nourishing. Half a pound of grain per day for each 100 pounds weight of colt is none too much for weanlings, yearlings, or two year olds, even when on good pasture. Stunted colts never do recover their normal conformation, and excuses are of small avail when buyers are purchasing.

DEXTER-KERRIES

Referring to a query which recently appeared in the Cultivator as to a breed of diminutive Irish cattle, a subscriber sends clipping as to these "vest pocket" cows. From this we quote:

"And they are real cows, too, that give quantities of milk and eat grass and moo just as the big cows do. Someone has aptly called them 'vest-pocket' cows, because of their size compared to the ordinary run of cows. Their real name, however, is Dexter. "This diminutive breed of cows stands two inches less than a yard in height, measuring from the top of the shoulder to the ground. And from the shoulder to the tip of the tail they measure but two inches more than a yard. Their average girth behind the shoulder is not quite a yard and a half. But these little fellows often weigh as much as 400 pounds; so you can readily see they could scarcely be considered toys or be carried in a man's vest pocket."

In addition we may quote from "Types and Breeds of Farm Animals," by Plumb:

"Characteristics of the Kerry. There are two types of Kerry cattle—the 'true Kerry,' which is usually black, and a smaller type known as the 'Dexter-Kerry.'"

"The true Kerry is a small breed of dairy cattle. The color is black, though red sometimes occurs. White may occur about the udder or scrotum, but is not desirable. The lean head carries upstanding slender white horns with black tips. With cows the neck is slender and long, the body of moderate proportions, the neck slender and long, the body of moderate proportions, the legs fine and long, and the udder large with medium-sized

Krogh Pumps

Don't fail to see our big exhibit at the San Francisco Fair. Also bear in mind that Krogh Pumps are supplying all the water for the big fair. This must signify superiority.

teats. In size this is one of the small breeds; the cows often weigh from 500 to 600 pounds, and frequently do not exceed 40 inches high. The bulls are larger, weighing 800 to 1000 pounds.

"The Dexter-Kerry is of unknown cross. Some authorities think that a

Have just finished a year's official test on a pure-bred Jersey cow, by name Goldie Beechfield. This cow was four years old when she started her test and is the first cow in Kanabee County to have an official test made on a year's work. She produced 10,131

The best method for destroying lice is to select a standard coal tar disinfectant and make this up according to the directions of the manufacturer. This should be placed in a dipping tank and all hogs treated. It has been found that 3 per cent cresol, 5 per cent

sary to dip the young pigs. To exterminate lice during cold weather, it is best to use crude oil, as this will not cause the animals to take cold. Some recommend the use of common sulphur, which they spread in the hog's bed. This will be melted by heat of the body coming in contact with it, which will cause sulphur fumes to rise, thus killing the lice.

IMPERIAL VALLEY HAY FIELD

Mr. Dexter, nearly a century ago, developed the breed by crossing Kerries on other stock. Some others regard it as a result of selection. This type is more blocky, shorter-legged, heavier of head and neck, and more beefy in type than the true Kerry, and, as seen by the author, much smaller. The color also is variable, being black, red or roan. There are wider variations among the Dexter-Kerry branch than in the true Kerry. In each case the udder is unusually well developed, showing large capacity in proportion to size of body."

CALIFORNIA ALMOST TICK FREE

The work of eradicating the tick in California will probably be completed during the present year, it is said by the federal authorities in charge. Only a section of San Diego County is now infested with the cattle tick. The rest of the state has been entirely cleaned of this pest at an average expense of only \$2.46 per square mile. Of this sum the federal government paid \$1.06 and the state the rest. The remarkable cheapness of the work, the cost per square mile being much less than usual, is explained by the fact that the work was done in a territory which was not thickly settled. The following table shows the expenditures since the systematic campaign was begun in 1907. Since then a total of 73,197 square miles has been disinfect-

Year.	Dept. of Animal Industry.	Bureau of State.	Square miles re-leased.
1907.....	\$ 18,992	\$ 6,720	\$11,517 6,570
1908.....	20,785	3,360	8,642 21,136
1909.....	24,816	2,515	8,119 8,000
1910.....	21,160	3,210	5,995 32,271
1911.....	17,307	2,640	2,636
1912.....	11,594	2,963	830 750
1913.....	7,101	1,605	580 1,834
1914.....	5,077	310	300

\$126,832 \$23,523 \$35,983 73,197

On March 1, 1915, since the above data was compiled, 3,501 square miles were released, leaving only 720 square miles in quarantine. The greater portion of this is included in one ranch.

COW-TESTING PAYS

AFTER several years' successful work in California Dairy Specialist Warren B. Thurston was transferred from this state to Minnesota. Touching upon his work and the work being conducted by the dairymen of that section, Mr. Thurston writes:

"Up until the time I came into this community but very few people knew what their cows were doing, and although there were some pure-bred cows in the county their production was unknown, but that is partly changed now and many are regularly weighing and testing their cows' milk.

pounds milk and 620.18 pounds fat. This is not bad for northern Minnesota. This cow will be tested again next year, and it is expected that she will make 800 pounds fat.

"Many pure-bred sires and some pure-bred cows have been brought into this community, and the standard of dairying is being rapidly raised.

"The local creamery with which I am working has increased both the quality and quantity of its output. When I came here the average score of the butter was about 89, and now the average score is 94. Prices paid patrons have been raised from about five cents under New York quotations to New York quotations. Cream grading has been instituted, and practically all the cream delivered is now first grade. The results thus far have been very gratifying. The dairy and creamery industry is in a fair way to prosper as a result of better cooperation and better methods."

TEN GUERNSEY COWS
AVERAGE 947 lbs. FAT

Large and Economical production is the key to larger profits. The Guernsey Cow is a sure way to increased profit.

A Better Made Not Made

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

The problem of grasshopper control promises to be a serious one in this county. I have had to do some original work because of the extensive stock operations through the infested sections. The original work consists in getting some sort of a container which will allow the hoppers to eat freely of the poison and still be strong enough to keep out the stock, and cheap enough to insure use in large quantities. I think I have succeeded and this season will prove the correctness of my theory.

A wallow for hogs that is full of clean water all the time is believed in by H. Clay Parker, member of the South Side Farm Improvement Association. Mr. Parker is afraid that the ordinary mud hole would spread disease among his swine, also that the hot sun would be too much for them, consequently he has made a shallow concrete wallow that is continually fed by a leak from the ditch. It would be very easy to cover a wallow of this kind by a broad low shade. It also serves as an ideal place to treat lice by placing oil on the surface once in a while. It is located under one ditch and higher than another so that it can be quickly flushed out.

A corn club has been formed by ranchers in the Higley District. A limited quantity of Mexican June corn, Sacaton strain has been distributed by Farm Adviser, J. A. Armstrong to men who wish to try it out for seed corn production.

The prize for the winner has not been discussed yet.

Grasshoppers are having no "cinch" at Liberty this season. Some time ago Dr. A. W. Morrill and Farm Adviser Armstrong attempted to poison them on the ranch of J. H. Knight at Liberty but did not have the success demanded by them. Since that time the office of the state entomologist has had a man stationed in that section and on Monday, June 28, a demonstration was made using a hopper dozer constructed especially for the purpose of catching grasshoppers before they are old enough to fly.

Alfalfa seed was the subject dis-

cussed by the farm adviser at the last meeting of the Chandler Farmers' Union. During the discussion it was shown that an alfalfa blossom is so constructed that it must be broken open before it can be fertilized. Bees do this naturally but in the absence of an abundance of bees, it might be well to assist them by mechanical means. Milton Fowler has gone over one of his fields with a float. The operation did good in setting seed but it also broke the alfalfa down thus causing some damage. It was suggested at the meeting that a barbed wire dragged several times across a field in full bloom might have the desired effect on the blossoms without doing any damage.

J. Stanley Howard has devised a very clever scheme to avoid some of the disadvantages of using the adobe hole. He has built a concrete wall through the middle of the water hole leaving one-half dry. The cattle drink over the wall. In some localities there is enough fall to the ground so that water may be stored in a water hole but drawn out by means of a pipe and used in a drinking trough lower down.

Blackhead in turkeys is proving destructive in certain parts of California and Arizona according to dispatch from the College of Agriculture at Tucson. It is recommended to quarantine all suspected birds immediately to prevent spread of the disease by water. It is also well to clean up premises and use permanganate of potash in the drinking water.

M. C. Tucker from Byers, Texas, has finally been chosen to be the tester for the Mesa, Chandler and Gilbert Cow Testing Association. Mr. Tucker is a graduate dairyman with three years practical experience in scientific dairy management.

San Diego County, H. A. Weinland,
County Agent, San Diego

Winter Vegetable Union.—A discussion of the marketing of San Diego County products was the first question taken up by the farm bureau after its formation a year ago and has gradually worked its way around until it has formed itself into two or three different lines of endeavor.

First the marketing committee of the farm bureau has been encouraging the curb market in San Diego in an effort to get public sentiment aroused to the point where a demand will be made upon the city of San Diego to establish a municipal market similar to that in other cities of the country. This will be a direct benefit, not only

to the farmer who lives close enough to the city to haul his produce to market and who has time to dispose of his products direct to the consumer, but also will be of great benefit to the purchasers in the city. This, however, is but a small part of the problem. The city of San Diego in its present size cannot consume all the small fruits and produce that can be raised within the county. It has been observed by many people that the climate of the county, particularly of the immediate bay region, is especially favored and that it is possible to raise vegetables later in the winter than in most any part of the state or of the west. Tomatoes at Christmas time and even as late as the 1st of February are not altogether uncommon. Peas can be harvested almost throughout the winter in especially favored localities. This situation is one that should be taken advantage of by the ranchers of this district.

The northern and eastern cities of the United States during the later winter months are almost destitute of vegetables of this character and the market is always good. The only thing that is necessary is for the farmers to organize sufficiently so that what they raise will be sufficient to warrant putting the marketing of it in the hands of a competent manager and so that they can take advantage of the better freight rates on large quantities.

A committee of interested ranchers has been working on a plan of this nature for some time. Several districts have taken hold of the plan quite enthusiastically and it is expected that more will join with them shortly in order to make the movement a great success.

Poultry for Profit

THE UNIVERSAL POULTRY SHOW

THE Universal Poultry Show is to be held at the Exposition Grounds at San Francisco, November 18-28. Entries close October 15. This show should go down in history as one that reflects great credit upon the intelligence and progressiveness of American poultry breeders and one that will result in inestimable benefits to the industry in general. The egg laying contest held at this exposition and the poultry in the sales department which is superintended by Judge W. S. Russell are viewed by thousands of people. It is therefore only reasonable to suppose that the real poultry show in November will attract unusual interest.

Educational Features Being Planned

An effort is being made to get some of the agricultural colleges, universities and poultry departments to stage educational exhibits in the poultry show buildings. Congress Hall, a large auditorium in the live stock office building, is within a few feet of the show rooms. It is properly equipped for lantern slides and moving pictures and it is the intention to hold lecture courses and demonstrations here.

Meeting of the American Poultry Association

The members of the American Poultry Association have voted to hold their annual convention at the time of the Universal Poultry Show. It will probably be held in Congress Hall on the exposition grounds. There will be an important business meeting and no doubt a great educational program with experts from all parts of the country. The program of the American Poultry Association can be obtained from the secretary, S. T. Campbell, of Mansfield, Ohio.

Organize and Make Car Lot Shipments

The poultrymen in a number of states are making an effort to assemble a carload of poultry at some central city, and have the car shipped in charge of one or two competent men. The expense in some cases will be pro rated among those who send birds and in other cases the fair commissioners from the state will pay a portion or all of the expenses. We suggest that the poultrymen in the different states take this matter up and organize for this purpose.

If any breeder cannot interest enough fanciers to make a small lot shipment or a carload lot, then he can well afford to send a display of his own birds on his own responsibility. You need no further proof that birds can be shipped across the continent and then win in the hottest competition than the fact that a California breeder this year sent a string of birds to Madison Square Garden, New York, and won three firsts, one second, one third, one fifth and a lot of special prizes after a journey of 3000 miles. If you put your birds in clean, comfortable coops and provide means for watering and feeding, it is possible to ship from any part of the United States or Canada and win at the Universal Poultry Show. It will pay even the smallest breeder to make a trial with at least a few of his birds. If he should win one ribbon, look what it would mean to him. The reward certainly justifies the effort.

All cars can be switched and unloaded and reloaded within a few feet of the poultry show buildings. This will save a lot of rough handling in express wagons. No previous exposition has ever had such accommodations or such good show rooms as is offered the poultrymen by this exposition.

California Should Profit Greatly

If the poultry breeders of California and the Pacific Coast do not cooperate and take advantage of the opportunity which they now have to show their birds and win at a World's Ex-

position, they will lose a chance which may not come to them again in a life time. This show should result in a poultry show being established upon the Pacific Coast that will mean to the people of the West the same that Madison Square Garden does to the poultrymen of the East. Even though you are a small breeder you should make an effort to exhibit a few birds.

The exposition itself is worth a four year's course in this country's greatest university or is equal in value to a trip around the world, if you study the exhibits, the peoples, and the nations represented. After giving these facts due consideration I hope the reader will be able to attend the show or will at least cooperate with this department in making this one of the greatest exhibitions of poultry that has ever been held anywhere in the world.

Rules and Prizes

Some changes have had to be made in the rules and regulations and you should familiarize yourself with them.

Birds will be received and cooped for exhibition on November 16 and 17. The exhibition period and time occupied in judging and reshipping the birds will be from November 18 to 28. The entries close on October 15 so all breeders should decide on the number of cocks, hens, cockerels, pullets and pens they wish to enter before that date. It is not necessary to decide on the exact individuals, but you should decide on the number and sex and select new bands to be put on them at the time of shipment. Send in your entry by or before October 15, 1915.

There is no limit to the number of birds any exhibitor may enter.

No entry fees will be charged for exhibits. A nominal fee of \$1.50 for each single specimen and \$4.00 for each pen will be charged to cover the expense of receiving, cooping, feeding, watering, exhibiting and returning the birds.

Exhibitors need not accompany their birds, but stock may be sent by express (charges prepaid) and the superintendent will see that they are given the very best of care and attention during the exhibition, and at the close returned to the owner or disposed of as he may direct.

Prizes

On all breeds and varieties of poultry recognized in the 1915 edition of the American Standard of Perfection and including Guineas and Pheasants, the following prizes will be awarded:

Cock, hen, cockerel, pullet, to each five prizes: First prize, \$5.00; second, \$4.00; third, \$3.00; fourth, highly commended; fifth, commended.

Breeding pen, to each five prizes: First prize, \$10; second, \$6.00; third, \$4.00; fourth, highly commended; fifth, commended.

In addition to the cash premiums, each prize will be designated by a beautiful silk ribbon from the Panama-Pacific International Exposition. These will carry more advertising value with them than any ribbon that can be won at any poultry show in America for years to come.

On pea fowl, one male and not less than four females: First prize, \$35.00; second, \$25.00; third, \$15.00; fourth, highly commended; fifth, commended.

Ostriches (one male and not less than four females): First prize, \$100.00; second, \$75.00; third, \$50.00; fourth, highly commended; fifth, commended.

A fee of \$7.50 will be charged for a display cage large enough to hold 10 or 12 birds which are intended only for display purposes.

Liberal premiums will be paid on all varieties of capons. Also prizes for the largest and best display of capons. There will probably be a demonstration in caponizing each day by some well known expert.

Write for Entry Blanks

For further information relative to

the Universal Poultry Show, the meeting of the American Poultry Association, or the meeting of Specialty Clubs, write to Mr. D. O. Lively, Chief of the Department of Live Stock, or to T. E. Quisenberry, Superintendent of Poultry, Panama-Pacific International Exposition, San Francisco, California.

TEMPERATURE AND HUMIDITY FOR EGG STORAGE

My eggs are coming out of my Cooper Brine System storage in first class condition. If anything I think my rooms are too dry. I have usually carried the temperature at the floor at 29 degrees Fahrenheit. Do you think that if I carried the temperature at the floor at 31 degrees Fahrenheit, which would make it about 31½ degrees Fahrenheit at the ceiling, that the humidity would be a little higher and reduce the shrinkage or evaporation of the eggs?

Do you think that eggs packed in tin cans with covers off would keep better than in cases, as this would avoid the straw board or filler flavor?

Some small experiments along this line with cracked eggs this year lead me to think that this suggestion might be worked out. Possibly the can might be perforated for a circulation of air. Eggs carried without straw board flavor would certainly find a ready market.

S. B. E.

Eggs are certainly better kept a little too dry than too moist, and, therefore, we would not recommend that you carry the temperature any higher than you have been carrying it. The higher the temperature the greater amount of moisture the air will contain and the greater the tendency to mold or "must." It is out of the question to avoid shrinkage or evaporation no matter how the humidity is carried, nor what temperature is maintained.

Experiments which have been conducted in keeping eggs in cans or other open receptacles in cold storage have not shown that this method is satisfactory, and we would recommend that you do some experimenting along this line, with a few cans only, to demonstrate the possibilities of the scheme to your own satisfaction before going into it on any large scale. It seems that it is necessary that eggs should be protected from a circulation of air by means of a porous material like straw-board or paper, and storing the eggs in a free circulation of air has not been found satisfactory. The so-called straw-board flavor, which you refer to, may be partially or wholly owing to a stale condition of the eggs or insipient "mustiness."

—Madison Cooper in Cold.

In wonder-workings, or some bush a flame,

Men look for God, and fancy Him concealed;

But in earth's common things He stands revealed,

While grass and flowers and stars spell out His name.—Minot J. Savage.

After you have talked with a Californian, nothing the preacher says about heaven is going to make much impression on you.

At these group or field meetings definite methods of practices will be demonstrated and discussed. The main subjects to be discussed will be silos (especially pit silos), silage and silage crops, winter grains and grazing crops, and live stock. It is also requested that the program committees of the local associations prepare a program on these subjects and appoint a member for each subject: Silos, silage, crops, winter grains, winter grazing crops. These members should study farmers' bulletins, state experiment station literature, and farm papers on the subject, and make brief report on the same. It is also suggested that a committee on fairs and exhibits and a committee on county organization be appointed, and be prepared to report.

Veterinary Queries

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Abcess on Jaw

Cow affected with something like tonsillitis. One side of throat badly swollen. Did not eat or drink for three days. Rubbed with liniment which reduced the swelling. It however continues to look bad. What can I do? The animal was formerly affected in the same way.—Subscriber, National City.

It is probably an abcess that breaks on the inside. It may be due to a small foreign body that remains and heals over from time to time. Bathe with liniment and rub it hard. A good liniment to use on it may be made of equal parts of turpentine, spirits of camphor, oil origanum and aqua ammonia. When you think it has broken inside squeeze it hard to expel everything that may be in the cavity. The trouble might be due to tuberculosis. In any case it would be well to have her tested with tuberculin.

Abcess

My cow fresh the fourth time has large hard lumps just forward of udder. Small sores developed on udder. The large place has increased until it is now nearly 18 inches in diameter. It has not as yet decreased flow of milk. Cow seems to be in much pain.—Subscriber, Nestor.

A poultice of bran and hot vinegar might relieve it but if you are near a veterinarian you had better call him to see it.

Giving Milk Before Calving

I have a two-year-old (coming) heifer probably a month or six weeks from calving. Calves have been fooling with her and brought her to her milk. She is giving two quarts a day. Shall I dry her up or let her go on giving milk?—Subscriber, Owensmouth.

If the time was longer we would advise letting her go dry, but by the time you get this it will be so near her calving time that we would advise keeping up the flow of milk.

The Spokane Interstate Fair and Live Stock Show will be held on the Interstate Fair Grounds at Spokane September 13-18. Live stock classes have been much enlarged this year and many new premiums offered.

Questions and Answers

THE EDITOR

AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Red Spider

My grape vines set fruit but when it is the size of number eight shot the leaves all fall off. This occurred last year about this time, the middle of June, and note it is beginning this year. Sprayed the vines with lime sulphur spray. There seems to be no insect present though we have been told the trouble is caused by red spider.—Subscriber, Corning.

If our subscriber has been looking for red spider he has perhaps been looking for too large an insect. As a matter of fact the red spider is almost invisible and when his work becomes apparent the insect has finished his season's work and gone. A more general dosing with flowers of sulphur will perhaps prove beneficial. Personal inspection of the vines would enable one to give a more satisfactory answer.

Coccidiosis

I am raising Belgian hares which seem nice and healthy but recently killed two young ones (about three months old) and the livers were full of what seemed to be chunks of fat. Is it a disease making them unfit for food? I feed alfalfa and ground barley. Where could I send a sample of liver to have it examined?—Mrs. G. T. H., Orland

Your rabbits are affected with coccidiosis, making the livers unfit for food. If you supply them with dry alfalfa hay and ground barley, we can see no fault in your feeding.—R. V. M.

Pine Needles for Mulch

A subscriber has asked as to the use of pine needles for mulching about trees or shrubs. We believe there would be nothing objectionable and that they would make an excellent mulch.

Alfalfa in Apple Orchard

Would like information as to the advisability of planting alfalfa in my entire apple orchard, that is, covering all the ground, both under the trees and in the middles.—Subscriber, Yucaipa.

We will be glad to hear from our subscribers on this particular point. However, no one can give very definite information without knowing more of the particulars as to the character of the soil, the quantity of water and many other points. The matter of growing a mulch-forming material in our orchards is being discussed more generally than ever before, and many of our producers would consent to planting middles providing there is sufficient water, but if our subscriber has only sufficient water to carry the trees he must bear in mind that alfalfa will probably crowd them and he will get a most indifferent tree growth because of the fact that alfalfa requires great quantities of water. We presume that if alfalfa is grown the intention is to mow and allow the hay to lie on the ground as a mulch.

Flyless Homes

Make yourself not-in-the-way inexpensive no halting mosquitoes and fly trap from plans sent on receipt of 50 cents. Eliminates in-the-way traps, sticky and poison papers. Greatest catcher of flies and mosquitoes ever invented. Satisfaction guaranteed. Why not be our agent in your neighborhood. Send 50 cents now for full details to

FLYTRAP CO., Longbeach, Cal.
Reference: Any Bank in Longbeach.

Bee Keepers Supplies

We keep a full line of supplies and are prepared to serve beekeepers promptly.

Write for Catalogue C
A. L. ROOT CO.,

58 Sutter St. San Francisco

In this way the soil would be materially benefited.

Summer Pruning of Vines

Will the yield of Muscats be increased by cutting runners? If so when is the proper time for this operation?—Subscriber.

No, cutting the runners will not increase the yield other than providing more shade so as to prevent sunburn. It will not make more or larger bunches. It will retard the ripening of the grapes.—J. W. M.

SIXTH APPLE SHOW BEST EVER

Sebastopol has held five annual Gravenstein Apple Shows, beginning in 1910. Now in 1915 preparations are being made to hold the sixth on a much grander scale than heretofore. It may be said that the one now in course of preparation, under leadership of Secretary J. P. Kelly, of the Sebastopol Gravenstein Apple Show Association will eclipse them all in size, variety and general magnificence.

Sebastopol has proven itself a great producer of a magnificent early apple and it is fitting that it be crowned king at least once each year.

The Northern Pacific is sending out a berry train from the Inland Empire to the East.

Frozen Custard

A Delicious Dessert
For Hot Weather

Nothing is more satisfying at the close of a meal these hot summer days than a nice cooling dessert. Try the following recipe for a delicious Frozen Custard, and you will make the whole family happy:

One quart rich milk; one handful raisins; one-half cup sugar; one-half cup Karo Syrup; three eggs; two teaspoons Kingsford's Cornstarch; one-half cup nut meats chopped; two teaspoons vanilla. Heat the raisins in the milk in a double boiler for twenty minutes. Make a custard of the other ingredients, adding the nut meats when cold. Freeze as ice cream. This may be varied by adding chopped figs, dates, etc.

Kingsford's Cornstarch is specified particularly in the above recipe because it is the brand always depended upon by housekeepers who have the best success with cornstarch recipes. It can be obtained at all modern grocers and costs no more than inferior brands.

In ordering, ask your grocer for a copy of the little Kingsford's Cook Book, which contains the above and hundreds of other recipes for dainty desserts, as well as a great deal of valuable information on culinary subjects.

The Price of Progress

THE Panama Canal stands as one of the most marvelous achievements of the age. Into its construction went not only the highest engineering skill, but the best business brains of the nation, backed by hundreds of millions of dollars.

Suppose conditions not to be foreseen made it necessary to replace the present canal with a new and larger waterway of the sea-level type, to be built in the next ten years.

Also suppose that this new canal would be the means of a great saving in time and money to the canal-using public, because of the rapid progress in canal engineering.

This sounds improbable; yet it illustrates exactly what has happened in the development of the telephone, and what certainly will happen again.

THE FRIEND

It's not that he's obligin',
Good lookin' or a saint:
Dear God (who made him out of mud)
Knows well that's what he ain't.

He never lent me money;
He never saved my life;
An' he don't like the brand I smoke,
An' I don't like his wife.

He's not so quick an' clever—
That is, not as a rule;
At times (the times we disagree)
He seems a sort of fool.

But still it somehow thrills me
To grip his hearty hand.
I guess the thing that makes us stick
Is that we understand.

I understand the varmint;
Sometimes he savvy's me,
And that's what makes a man your
pal
As far as I can see.
—Charlton Lawrence Edholm.

A CURE FOR INDECISION

"Eva," said Jack Severance, "I must return to the city tomorrow. I wish you to tell me before I go whether you

will marry me or not."

"Suppose I say 'not,'"

"Then I will not ask you again."

Eva winced.

"I believe," continued Jack, "in a woman taking plenty of time in making up her mind on such an important matter as marriage, but what's fair for one is fair for the other. It would be as unreasonable for the man to put off the wedding day indefinitely as for a girl to take an indefinite time to accept or decline him."

"If I accept you and we find what so many are finding nowadays, that marriage is in our case a failure, you will be the sufferer as well as I."

"Correct. And if we grow every day more devoted to each other you will be the gainer as well as I."

"In other words, it's a game of chance."

"If you think so, why not come to your decision by a game of chance? I will play you an odd number of games of euchre; if I win the most of them you marry me; if you win the most of them you don't."

"There would be no sense in that."

"Why not?"

"If I wanted you I would play badly; if not I would play my best. But it wouldn't be fair anyway, because you are a much better player than I."

"You might spin a coin. No one can tell on which side a coin will fall. Fate alone would decide in that case."

"But suppose fate should decide wrong?"

"If you know which alternative is wrong why resort to cards or coin spinning? Why not decide in the right yourself?"

"But I don't know which way is wrong."

There was silence for a few moments. She looked very unhappy. There is no greater source of mental discomfort than vacillation.

"I'm going to give you," he said, "till 9 o'clock tonight to decide. If you don't decide in my favor before the clock strikes 9 I shall wait no longer."

"What do you mean by that?"

"I shall withdraw the offer."

"You mean you'll never ask me again?"

"If you prefer that method of expressing it."

"You're very independent, aren't you?"

"I have reached a decisive point."

Jack bade her adieu and left her. He knew that he possessed her heart and that she would marry him, but she would never make up her mind to do so. He must make up her mind for her.

But how should he do this? He would have done it long ago if he could. He had thought of frightening her into it by some drastic measure, but in that case there was a possibility of her breaking with him altogether. He had finally concluded to set a limit of time for her answer, but he knew that the clock might strike 9 till the crack of doom and it would have no effect upon her.

But he was determined to get his answer and get it before leaving her again. They lived a thousand miles apart, and he could not be making journeys to go back after each with nothing decided. He had a simple plan in his head, and if he could get her to adopt it she would decide in his favor. The result would be accomplished by stratagem, but he considered that the end justified the means.

When he went back to her in the evening he had a new silver half dollar and a new quarter in his pocket. He called at half past 8. He skirmished for a quarter of an hour, when he drew forth a half dollar and said:

"Are you willing to leave this matter between us to Fate for decision?"

"Yes, I am. I'm tired of trying to decide it myself."

"Very well. I will spin this coin, or you can spin it yourself if you like. You may choose heads or tails. If you win, I losing, you refuse me; if I win you accept me. The best in five spins decides."

"You may spin the coin and choose heads or tails."

"Very well. He spun the coin, called 'heads' and won. He spun it again, calling 'heads,' and won again.

"I believe it's loaded," she said.

"If you think so I will try another coin for the balance of the trial." And he brought out the quarter. He spun it, crying "tails" as he did so. She watched it with bated breath till it fell "tails" up. He took her unresisting in his arms.

She looked up at him with a great relief. He had broken or Fate had broken through her indecision, and now that the barrier had been passed she was very happy. She cared not how she had been dragged over it so long as it was behind her.

After they were married she found in her husband's box, where he kept scarfpins, watch chains and such odds and ends, a half dollar and a quarter. She asked him if they were mementos. He said they certainly were mementos, since they had made him happy in giving him her. He spun them, the half dollar invariably falling heads up, the quarter tails up. Then with a microscope he showed her that the milling of the larger coin had been filed on the tail's side and the quarter on the head's side.—Denver Field and Farm.

IDEAS FOR THE COOK

Written for the California Cultivator
By Isabel Cottle

Breakfast

Iced Currants

Eggs in Batter Creamed Potatoes
Queen of Muffins Honey
Coffee

Lunch or Supper

Tuna with French Dressing
Macedoine Vegetables Cottage Cheese
Berry Rolls Tea or Milk

Dinner

Baked Ham, Browned Potatoes
Stuffed Summer Squash
Cantaloupe Salad
Warm Blackberry Pie
Coffee

Eggs in Batter (Individual Service)

One egg, one and a half tablespoons thick cream, two tablespoons fine stale bread crumbs, one-quarter teaspoon salt. Mix cream, bread crumbs and salt. Put one-half tablespoon of mixture in egg-shirrer. Slip in egg and cover with remaining mixture. Bake six minutes in moderate oven.

Queen of Muffins

One-quarter cup butter, one-third cup sugar, one egg, one-half cup milk (scant), one and a half cups flour, two and a half teaspoons baking powder. Cream the butter, add sugar and egg well beaten; sift baking powder with flour and add to the first mixture, alternating with milk. Bake in buttered tin gem pans 25 minutes.

Macedoine Vegetables

Melt three tablespoons of butter, add three tablespoons of flour and gradually one and a half cups of milk. When thickened add one cupful each cooked string beans, peas and cold boiled potatoes, cut in cubes. Season with salt and paprika and let stand 15 minutes over hot water before serving. As this calls for other vegetables it may help to use up the leftovers.

Baked Berry Rolls

Roll biscuit dough thin in the form of small squares, spread over berries, roll up, put rolls in dripping pan, close together until full, then put into the pan a very little water, sugar and pieces of butter; bake one-half hour in moderate oven. Serve with pudding sauce.

Cantaloupe Salad

Cut well chilled cantaloupes in halves lengthwise, take out the seeds and remove the pulp in nice even pieces, sprinkle them with salt and paprika and an equal quantity of crisp lettuce cut in strips and dress with a good boiled salad dressing. Place the shells of the cantaloupes on salad plates, garnish with the large leaves of lettuce and fill them with the cantaloupe and lettuce mixture. Serve at once while cool and crisp.

I like the new version best: "If at first you don't succeed, find out the reason and then try again."

HOUSEHOLD QUERIES

Curing Rose Petals

In the Cultivator of June 10 some one asks how to cure rose petals. I have found by experience that they retain their perfume better if dried in the shade than in full sunlight. If space indoors is scarce place the fresh petals on a paper (not too thick) and slide under the dresser, couch or any stationary piece of furniture. Stir once a day until dry.—Mrs. H. M. McCall, Imperial.

PROTECTION AGAINST CLOTHES MOTHS

The various substances used to keep away moths, such as tobacco, camphor, naphthalene cones or balls, tarred paper, and cedar chips have no effect if the eggs are already present in the clothes, and entomology specialists in the United States department of agriculture therefore recommend a thorough beating, shaking, and brushing of all articles likely to attract moths, before they are laid away for the summer. The brushing of garments is especially important in order to remove eggs which may have escaped notice. If the articles are quite free from eggs or larvae when laid away, the odor from the various repellents already mentioned or from cedar chests and wardrobes will serve to keep the moths away. This odor, however, lessens with age, so that the protection it affords is greatly decreased

PRESERVING HINTS

Timely Information for Women
Who Do Their Own Preserving

Experiments conducted by both English and American manufacturers of high grade preserves, jams and jellies, have demonstrated that the most satisfactory product can be produced if part corn syrup is substituted for all sugar. The corn syrup being less sweet, more of the natural flavor of the fruit is retained, and it is only necessary to use sufficient sugar to make the product sufficiently sweet to please the individual taste of the consumer. This is particularly true in canning pears and other fruits having a delicate flavor. Most housewives desire a thick, heavy syrup; and, in order to obtain this, so much sugar is used that the canned or preserved pears have a cloying sweetness. This is also true of peaches, raspberries and many of the other more delicately flavored fruits.

But in order to obtain the best results, it naturally follows that the best quality of corn syrup be used. Housekeepers everywhere have found the brand of syrup known as Karo (Crystal White) most satisfactory for this purpose. Too much cannot be said in favor of the use of Karo in the making of jams and jellies, especially from such fruits as grapes, where the natural sugar of the fruits is inclined to crystallize. The use of Karo Syrup (Crystal White) with sugar will absolutely prevent crystallization.

Ants Cannot Exist

Where The Following Simple
Method Of Extermination
Is Pursued

Ants are persevering insects. They persist in living long after you think you have put the quietus on them forever. A cat may have nine lives, but he has got nothing on an ant in this respect.

Many remedies have been tried on ants without result, but one has at last been discovered which will absolutely put them out of business. A baker and candy-maker in Los Angeles, driven to distraction by this pest, prepared a paste which drove every ant out of his shop in one day. Ants cannot exist where this remedy is used. Thousands of testimonials from all over the country bear witness to its efficacy.

It is put up for general use under the name of Kellogg's Ant Paste, and can be obtained at all good druggists. Try a package today and end your ant troubles for all time.

after a few years. For this reason when furs and other valuable garments are wrapped in tarred paper or placed in sacks of tarred paper these containers should be removed every year or two.

In general moths are likely to affect only articles which are put away and left undisturbed for some little time. Apartments and closets that are frequently aired and swept are not apt to be seriously affected. In fact airing and sunlight are probably the best as well as the oldest remedies. Where circumstances demand that the articles be put away, however, a convenient and effective device is to place them in large paste-board boxes such as tailors use and gum a strip of wrapping paper around the edge so as to seal up the box completely and leave no cracks. If the garments have been thoroughly cleaned before being placed in these boxes, no additional protection is necessary and there is none of the objectionable odor which is characteristic of so many repellents.

For valuable articles the safest plan is to place them in cold storage. Recent experiments have shown that the larvae of the clothes moth will resist for a long time low temperatures if these are uniform, but that the alternation of low and high temperatures quickly results in death. It is recommended therefore that storage companies submit their goods to two or three changes, varying the temperature from about 18 degrees Fahrenheit to 40 or 50 degrees Fahrenheit. After this preliminary treatment, they should be kept permanently at about 40 degrees Fahrenheit. Any lower temperature is a needless expense.

SAUCES FOR FISH

Some people think that frying is the only way in which a fish can be cooked. Many who have lived all their lives on the shores of the greatest fishing region in the United States have never discovered how delicious a Mackinac trout or whitefish is, when stuffed and baked, or boiled and served whole. Large fish make wonderfully good "cutlets," when boned, cut across in slices, tied to preserve their circular shape, buttered and baked in the oven to a golden brown. Cut the fish across in inch-thick slices, removing bones. (The fish peddler will do this for a few cents extra, and it is well worth the money.) Salt and pepper the slices, flour them and lay them separately in pieces of rather thin white cloth well floured. Tie cloth around, so the fish will retain its shape, and boil for about half an hour in water in which has been put a piece of bay leaf, two or three cloves and a slice of lemon. Remove from cloth on a hot platter, and cover with any favorite sauce for fish.

There are several good fish sauces which add greatly to the taste as well as looks of a fish dinner.

Drawn Butter—Rub together one cup of butter and small tablespoon of flour; pour upon it one scant cup of boiling water and let it boil up once. Parsley cut fine can be added, if liked.

Egg sauce—Make drawn butter and pour it over two eggs boiled hard and cut fine.

Cream Sauce—One pint of cream, heated to the boiling point; stir into it a tablespoon of butter, a little salt and a half cup of the water in which the fish was boiled. If it does not thicken, rub smooth a teaspoon of arrow-root and add to the sauce.

Oyster Sauce—One pint of oysters, one-half a lemon, two tablespoons butter rolled in flour, one teacup milk, pepper and salt to taste. Heat the oysters, cut in pieces, if large; when boiling hot, skim, and add the flour and butter with the other seasoning; have the milk heated in another dish; and add that and the lemon juice, when taken from the fire.

Piquant Sauce—One cup of meat-liquor; heat to boiling, skim and season with salt and pepper. Brown two tablespoons of butter in a sauce-pan with one of flour; pour the meat-liquor into the pan and add a teaspoon of made mustard, a little onion juice, a large spoon of vinegar and some parsley.

Horseradish Sauce—To three tablespoons of grated horseradish, add one tablespoon of vinegar, one-fourth teaspoon of salt, pepper to taste, and one-fourth of a cup of cream. Mix the first four ingredients and add the cream, which has been beaten to a stiff froth.

"One," says Nature
"Three," says Cunning

Because demand far exceeds supply, man craftily splits each cowhide into several sheets. But—there can be only one sheet of grain leather. The rest are merely "splits"—coated and grained to look like the genuine article, and sold as "genuine leather," but they do not wear like hand or machine buffed leather. Right here enters

RAISINS

The following prices, are f. o. b.

HAY

Under date of July 3, Scott, Magner & Miller say:
We report total arrivals of hay on the San Francisco market during the week ending today at 4350 tons. On account of export activities during the last few months large quantities of hay have been turned, relieving the situation so that the new crop may come in on a better basis. Harvesting is going on very satisfactorily and the quality of wheat and red oat looks most attractive. The feeling among producers appears to be firmer on choice lots, although we do not believe that there has been much trading done during the week.

Most of the arrivals are of old crop, very little of the new grain hay being ready for shipment. There appears to be quite a volume of volunteer hay but of such character that it is expected to be slow in moving under prevailing conditions. Alfalfa hay has been coming in in moderate quantities with the market set and fairly well maintained. Fancy Wheat Hay (11. bales).....13.00@14.00

Citrus Fruit Market

Los Angeles, July 7, 1915.

Orange prices remain very much as they have been for the past two or three weeks. Owing to larger receipts in most Eastern markets of midsummer fruits there is a slightly easier feeling. Present prices are running far above those of former years at this time with similar quantity of fruit shipped.

We have remarked before the lemon market could not be worse. The condition is getting "no better fast." It would require a month of good hot weather to clear the situation.

Shipments

Shipments of oranges from Southern California to date since November 1, 1914, 29,199 cars, lemons 4827, total 34,026. To same date last season, oranges 31,292, lemons 2218, total 33,510. From Tulare County, oranges 5648, lemons 198, total 5846. To same date last season, oranges 5867, lemons 30, total 5897. From Northern California 630, lemons 2. To same date last season, oranges 404, lemons 5.

KEEP SUGAR BEETS

(Continued from Page 29)

sugar company's instructions for one or two weeks.

The farmer who, whether or not from choice, accepts the flat rate, sustains an actual money loss corresponding to the shrinkage in tonnage through evaporation. He is paid according to the net weight of his beets at the time they are weighed on the factory scales. Let us say that a good beet grower obtains a yield of 20 tons an acre and agrees to accept a flat rate of \$5 a ton. This equals \$100, gross receipts, an acre. Experiments have shown that an average daily shrinkage of about 6.5 per cent may occur when handling the beets in the ordinary manner. Beets are often left several days in the field after they have been dug. This means a loss of \$6.50 a day per acre.

When the farmer has no alternative but to accept a flat rate, he may retard the evaporation of his beets by leaving them in large piles covered with the beet tops, as previously described.

CANNING VEGETABLES

(Continued from Page 34)

Green peppers are canned very well by the cold water method.

Select the green peppers, cut off the stem end and remove seeds. Parboil peppers for about 15 minutes or until the peppers are tender. They should not be cooked long enough to cause them to lose their shape. Pack them in jars, pour cold water over the peppers and seal. They are ready for use any time during the winter. These peppers may be filled with cold slaw, left over meats or other suitable fillings.

If care is taken in cooking the vegetables a sufficient length of time and if the vegetables selected are fresh the trouble in canning vegetables will be overcome.—Maryetta Wilson, Colorado Agricultural College, Fort Collins.

Books

This list is prepared with the purpose of enabling our Cultivator readers to supply themselves with standard books at lowest possible prices. We call especial attention to a few of the new publications. "Citrus Fruits" by Professor Coit, of the University of California, covers all phases of the Citrus Industry under California conditions—the kind of a book we have had many calls for but never before been able to supply. "Productive Feeding of Farm Animals" by Woll, will command special attention. "Poultry for Profit" (The Cultivator Poultry Book) by Koethen, another California book, is new and excellent, telling what to do and what not to do with poultry in California; a sure guide to poultry success. The new Standard Encyclopedia of Horticulture, by Bailey, is not equalled by anything of the kind which has ever been published at any time in any language. Special terms of payment and discounts are offered by the publishers through us on this Encyclopedia. Write us about it.

HUDSON

Rides the Crest

1041 Sold in Two Days

On Monday and Tuesday, June 14th and 15th—Opening Days for This New Model—Dealers Sold to Users 1041 HUDSONS

This new-model HUDSON—for 1916—was first announced in the newspapers on June 13th. About the same time announcement was made in Farm Papers and weeklies covering America. All announced these four great innovations:

**The Yacht-Line Body
The Lustrous Finish
More Room and Luxury
A \$200 Price Reduction**

On Monday and Tuesday, June 14th and 15th—the opening days—every HUDSON showroom in the country was crowded to the street. Every road around brought farmers to see this newest car.

Many thousands of men were turned away. There was no chance for demonstrations. Even careful inspection was almost impossible. Yet 1041 men in those two days bought these new-model HUDSONS. In those two days men paid \$1,400,000 for a HUDSON model none had ever seen before.

The Avalanche

June 14th and 15th broke every record in the sale of high-grade cars. We knew the avalanche was coming, but the actual demand amazed us. All over the country motor car buyers had been waiting this new model. We held our announcement until dealers could get reasonable stocks ahead.

But the first two days sold nearly half a month's output. By the time this appears our deliveries of this new model will reach 4500, probably. We are building 115 per day. But that will hardly begin to supply the men who want this HUDSON car.

Came Like a Comet

It was only 22 months ago when this HUDSON introduced the new-type Six. It was designed by Howard E. Coffin, the famous HUDSON designer, and weighed under 3000 pounds. It cut fuel and tire cost in two.

The price was \$1750 then, but that price was the season's sensation. To sell a high-grade Six under \$2000 was considered impossible then.

The demand for that car was far ahead of supply. The next

We have dealers everywhere. These are a few in your vicinity:

HUDSON
\$1350
F. O. B.
DETROIT

season we doubled our output and brought the price to \$1550. On that model last summer we were at times 4000 cars oversold.

On this new model we doubled our output again, and brought the price to \$1350. In but a few months this new-type car has quadrupled the HUDSON output. It has changed the whole idea of a class car. Today it dominates in a conspicuous way the field of the quality Six.

No Car Like It

HUDSON popularity brought many a follower. Within a few months there were dozens of makers building cars in the Light Six class.

But Howard E. Coffin and his engineers had then spent three years on this HUDSON. They were working all the time to improve it. They worked out countless refinements. Within 20 months they had added to this HUDSON 51 distinct improvements. And our multiplied output had brought the price down to \$1350.

Today this HUDSON finds no rival in sight of it. Such a car at such a price is impossible with small productions. Many of the best of HUDSON features are not found in other cars. Today you cannot find even second choice to the HUDSON if you seek a high-grade Six.

New 1916 Features

This new-model HUDSON brings out the Yacht-Line body. It shows for the first time the Lustrous finish. Each coat is baked on in enormous ovens. It has a roomier tonneau, a wider rear seat. It has disappearing extra seats to double the tonneau room.

It has enameled leather upholstery. It has deep, luxurious cushions.

And it has, above all, the approval of owners. Many thousands of men have proved out this HUDSON on millions of miles of road. Any owner will endorse this to you as the perfect car.

Go see it before our summer output is sold. Now you can get an early delivery. Later we fear that you cannot.

Books

This list is prepared with the purpose of enabling our Cultivator readers to supply themselves with standard books at lowest possible prices. We call especial attention to a few of the new publications. "Citrus Fruits" by Professor Coit, of the University of California, covers all phases of the Citrus Industry under California conditions—the kind of a book we have had many calls for but never before been able to supply. "Productive Feeding of Farm Animals" by Woll, will command special attention. "Poultry for Profit" (The Cultivator Poultry Book) by Koethen, another California book, is new and excellent, telling what to do and what not to do with poultry in California; a sure guide to poultry success. The new Standard Cyclopedia of Horticulture, by Bailey, is not equalled by anything of the kind which has ever been published at any time in any language. Special terms of payment and discounts are offered by the publishers through us on this Cyclopedia. Write us about it.

California Cultivator

Rural Californian combined with California Cultivator

Vol. XLV No. 3

LOS ANGELES: THURSDAY, JULY 15, 1915

One Dollar Yearly

Attractive Goods Attractively Packed

Pack of Trademarked California Nuts Gives Assurance of Quality

Difficulties in the way of marketing California products only lend zest to the game. The California Fruit Growers' Exchange met the condition of the greatest citrus fruit crop ever and a financial depression, perhaps the greatest ever, with a campaign of advertising and of marketing methods which has resulted in closing the orange season most satisfactorily to the growers.

Now comes the California Walnut Growers' Association with an up-to-date idea. It will try the experiment of marketing fancy soft shell California nuts under its Diamond Brand in pound cartons. The front of the carton is given almost entirely to "Diamond Brand California Walnuts, Fancy Soft Shells." In the center is a diamond opening with isinglass back, which permits the fancy soft shells to peep into the world and give the purchaser a demonstration of the fine quality of the goods which are guaranteed by the association. The walnuts are carefully selected and all packed in California. On the back of the carton is:

"Diamond Brand California Walnuts. California Walnut Growers' Association Diamond Brand.

"California produces the finest walnuts grown and the choicest of these

New Type of Carton Used by California Walnut Growers' Association. Note Opening Which Permits of a View of the Goods

Quality is Secured by Thrifty Orchards as Illustrated on Cover

are packed under the 'Diamond Brand.'

The quality of Diamond Brand nuts is guaranteed. They are put up in packages so the consumer can easily identify and always be sure of getting these guaranteed nuts.

"Packed by the growers in their own walnut groves, and shipped direct.

"One and two-pound sizes. When ordering specify Diamond Brand and you will get the same high quality nuts this package contains."

Manager Thorpe says that at least 1,000,000 of these cartons will be put on the market this year. There will be no extensive advertising campaign taken up but the market will be tested and the wishes of consumers learned, and another year it is probable the campaign will be materially enlarged.

The manager of the association pushing this aggressive fight is Carlyle Thorpe, and the board of directors are: C. C. Teague, R. W. George, P. F. Cogswell, A. T. Currier, Roger G. Edwards, James A. Fay, R. M. Hargraves, C. W. Leffingwell, Jr., M. Nisson, Ralph McNeese, Robert H. Neely, B. F. Porter, T. A. Rice, H. C. Sharp, L. T. Webster, George M. Williams, George A. Cook, H. Zander, George E. Farrand, S. H. Stow, W. S. Dunshee.

Making Orange Vinegar

Written for California Cultivator by W. V. Cruess

THE California pure food law requires that a vinegar must contain at least 4 per cent acetic or vinegar acid in addition to the natural fruit acid, which usually amounts to over .5 in oranges. Vinegar manufacturers do not usually use the word "per cent," but employ the term "grains strength," which is simply per cent acid as acetic multiplied by ten. For example a "45-grain" vinegar is a vinegar containing 4.5 per cent acid. A number of methods are in use for testing the acid strength of vinegar, but the most simple and easily operated tester is the Leo acid tester. Any one desiring to make vinegar commercially should have some means of ascertaining the acid strength of his vinegar so that it will conform to the pure food standards.

Vinegar making depends on two separate and distinct fermentations. The first is the conversion of the fruit sugars into carbonic acid gas and alcohol by the action of yeast; the second is the fermentation of the alcohol to acetic acid by the vinegar bacteria. (Vinegar mother is simply an aggregation of vinegar bacteria.) The acid formed by vinegar bacteria is poisonous to yeast, and yeast fermentation is stopped by the presence of a small amount of acetic acid; hence it is imperative that the yeast fermentation be complete before vinegar fermentation is allowed to start. Therefore the practice of adding "vinegar mother" to fresh juice is not a safe plan, because it may form enough acid to stop alcoholic fermentation.

Extraction of Juice

The extraction of the juice for vinegar making is easily done by crushing

and pressing the whole fruit. An apple or grape crusher and apple or grape press will do the work. Oil from the skins will do no particular harm in this case.

Control of Yeast Fermentation

Orange juice contains all manner of yeasts, molds and bacteria, but only a small amount of suitable forms of yeast. There are only a few varieties that will ferment the sugar completely without wasting it; most of the yeasts found in orange juice waste the sugar by fermenting it to carbonic acid gas and water instead of to alcohol and carbonic acid gas. In a good fermentation of orange juice with ten per cent sugar the juice should contain at least five per cent alcohol after fermentation. In practice, five per cent alcohol should give under normal conditions 4.5 per cent acetic acid at least. This would be only .5 per cent above the pure food standard. Since ten per cent sugar may be taken as a fair average for ripe fruit we can readily see that the margin is small and that sound fermentations must be obtained.

Experiments have shown that the undesirable yeasts can be removed by using not more than two ounces potassium metabisulfite per 50 gallons of juice. This material furnishes sulfurous acid, the active principle in removing undesirable yeasts. The amount used is very small and practically all disappears during fermentation. This substance is best added after dissolving the required amount in water.

To the treated juice about three gallons of wine yeast per 100 gallons juice must be added. This yeast carries on a rapid and complete fermentation

lasting about five days at ordinary summer temperatures. The yeast can be obtained from the University of California. Directions for increase of the yeast and its use are sent with it.

Fairly good results can be obtained, however, by the use of compressed yeast without the use of the metabisulfite. To use this yeast a starter is made by heating one gallon of juice to boiling, letting it cool four or five hours to room temperature, adding a cake of compressed yeast, and keeping the juice in a clean scalded demijohn in a warm place two or three days. This gallon can then be used to start five gallons of boiled and cooled juice. This five gallons can then, when rapidly fermenting, be used to start 100 gallons of fresh unheated juice. The 100 gallons in turn or a portion thereof can be used to start the next fermentation; and so on. The repeated transfer of the yeast accustoms it to the juice. Beer yeast can not be used safely because it ferments too slowly and incompletely.

Vinegar Fermentation

When alcoholic fermentation is over, as evidenced by ceasing of gas evolution and absence of sweet taste, the acetic fermentation should be started. Unlike apple cider, fermented orange juice does not normally develop a vinegar fermentation spontaneously, but simply grows "wine flowers," a fungus which ferments alcohol to water and carbonic acid gas, and the "wine flowers" may be followed by putrefying bacteria finally turning the orange wine into a putrid liquid.

If to each 100 gallons of orange juice, after yeast fermentation is complete, 25 gallons of strong vinegar (preferably new vinegar) is added,

normal fermentation will result. This will give a strong vinegar. The first fermentation may be started with cider vinegar. When this lot is made it can be used to start other lots.

Air is required for vinegar fermentation; therefore the barrels used should be filled only two-thirds to three-fourths full and the ends perforated above the level of the liquid for free passage of air. Bulletin 227 of the California experiment station (obtainable on request to the Dean, College of Agriculture, Berkeley, California) gives a diagram of such a barrel. With such an arrangement and with a starter of vinegar as outlined, fermentation should be complete in six months or less.

Rapid generators are used in large factories. They are simply tall narrow tanks fitted with a false head and filled with beech wood shavings or rattan strips. The vinegar stock trickles down over the shavings and air comes in through vents near the bottom. The shavings present an enormous surface coated with bacteria. On the surface the combination of the oxygen of the air and the alcohol to form acetic acid is very rapid. Such generators have a capacity of 25 to 50 gallons per 24 hours. They average about 12 feet by 40 inches in size. See Bulletin 227 for diagram.

A very simple and effective generator can be made from a barrel or small size tank as shown in the accompanying diagram. The barrel is divided longitudinally into two compartments with two perforated partitions or shelves with a space between the shelves for air circulation. Air inlets are placed at the ends of the barrel as shown. The spigot that happens to be uppermost is left open as

Don't Plant CITRUS TREES

until you can meet the five essential requirements of success. Here they are: Sufficient Water Supply; Quality Trees; Safe Thermal Conditions; Good Care; Good Soil.

These five things are fundamental and he who ignores any one of the five invites failure.

Good fruiting trees are good revenue producers, and if you have the requisite water, location and soil—true citrus land—you cannot afford to miss the opportunity to

Plant Citrus Trees

Place your order NOW for Spring delivery. You will perhaps never have another chance to buy QUALITY TREES at so reasonable a price. Even the so-called CHEAP TREES which might better be called EXPENSIVE TREES by the man who expects to receive an adequate return on his investment, are quoted the same or very little less.

We were founded twenty-five years ago, and have been improving the grade ever since. Buy TEAGUE QUALITY TREES, embodying vigor and symmetry of root, body and top—and in the selection of buds, which will not only be true-to-name in the general acceptance of the term, but true to the best type of the varieties to which they belong as well.

Write today for prices and particulars. No orders too large or too small to fill. All correspondence promptly answered.

CUT FERTILIZER COSTS

The cheapest commercial or barnyard fertilizer you could obtain costs from \$15.00 to \$40.00 per acre. Cover crop seed with inoculation so it will produce quantities of both nitrogen and humus, costs only \$3.00 to \$5.00 per acre. Farmogerm is the standard inoculator.

The Standard Inoculation

FARMOGERM

High-Bred Nitrogen Gathering Bacteria.

is a moist, jelly-like substance, containing billions of nitrogen-gathering bacteria. It is put up in a patent bottle which keeps the jelly (containing bacteria food) moist at all times.

Bacteria cannot live long in cotton wads, granular media, or in any other dry state. The nitrogen-gathering bacteria live for years in the moist jelly-like media of Farmogerm.

Results Guaranteed

Prices: 1 Acre, \$2.00; 5 Acres, \$6.00; 50 Acres, \$55.00.

Our inoculation experts will gladly give detailed information regarding inoculation with FARMOGERM.

an air outlet. The barrel is filled less than half full. It is rotated one-half way around several times daily. In this way one-half of the shavings is wet with vinegar and exposed to rapid aeration. Vinegar fermentation is rapid in such an apparatus. For convenience in rotation the barrel may be placed on two scantlings.

Clearing the Vinegar

When the vinegar has reached 4.5 per cent acid or over it may be filtered through any form of filter used in wine making if the metal parts of the filter are heavily tinned to prevent corrosion by the acid. For small scale operations bag filters will answer the purpose. Filtration is increased greatly in speed and the clearness of filtrate greatly improved by adding a small amount of infusorial earth such as uncalcined Filter-Cel to the vinegar before filtration.

The vinegar can also be cleared by use of Spanish Clay. This is used by grinding it finely, mixing and agitating with a small amount of vinegar for a

what by hand labor in order to level the floor of the basins so that water will spread quite evenly over the entire surface. A permanent furrow may be left between the basins in the direction of irrigation from which the water may be turned into the basins. Alfalfa hay, bean straw, or stable manure are the best materials for this purpose. Two bales of either of the former, or 20 feet of stable manure to the tree should be about right for the original application. This should be added to from time to time so that the entire ground in the basins remains covered.

Considerable attention is given at the present time to some system of mulching the entire ground in citrus orchards. We are not in a position as yet to say whether or not any such system is proper or practicable for California conditions. There are a number of things, however, which tend to indicate both the safety and value of such treatment sufficiently to strongly endorse it for the limited purpose suggested above. Among these

Diagram of Barrel Rapid Vinegar Generator Adapted from Pacottet, Eau de Vie et Vinaigres

week or ten days, adding this mixture to a larger quantity of vinegar, mixing, and allowing to settle until clear. The clear vinegar can then be drawn off from the sediment and the sediment filtered through a bag filter. Usually four to eight pounds of clay per 100 gallons will be sufficient; if the first trial fails, simply add more of the prepared clay.

Bleaching

Orange vinegar is very dark in color. The excess color can be removed by a small amount of pure bone black added before filtration if so desired.

Bottling

Bottles should be filled as full as possible to check excessive formation of vinegar mother; or the vinegar may be pasteurized at 145 degrees Fahrenheit after bottling. Bottles using beer caps are convenient. Capping machines are inexpensive and can be obtained from any large bottle company or dealer in capping machines.

AN IRRIGATION SUGGESTION

By R. S. Vaile

One problem which is confronting citrus growers is the difficulty of properly distributing irrigation water to the trees nearest the head flume and furthest from same. In some 100 groves visited this summer during irrigation over 75 per cent were noted where the trees at the lower end of the rows were either getting only a small portion of the amount of water given those at the upper end, or else a very considerable amount of water was being wasted as run-off. In several cases it was estimated that the equivalent of one-half inch of rainfall for the acreage being irrigated was lost in this way.

The remedy for the above condition which appeals to us as being the most practical and efficient, and which has been tried by sufficient growers to assure its possibilities, consists of a system of permanent basins filled with mulch around the lower few rows of trees. For this purpose square basins covering nearly the entire ground should be made. The outlines of these basins may be thrown up with any ordinary ridger. This work should be supplemented some-

may be mentioned as important for consideration the more uniform moisture and temperature conditions obtainable, the avoidance of having to work the ground too wet, the elimination of the tendency to form plow sole and the permitting of roots to feed in that part of the soil near the surface where a large portion of available nitrogen is concentrated. Recent moisture determinations comparing this system with clean culture show that less water is required to maintain a given moisture content. Mulching of the entire ground has proven of great value in Florida, Cuba and elsewhere, and we believe that in the limited form suggested it is applicable to our conditions and will prove a real benefit.

THE CITRICOLA SCALE

Prof. H. J. Quayle has been making a long study of the citricola scale which was formerly supposed to be the soft brown scale. He has written an account of his studies and experimental work in the control of this pest which appears as Bulletin 255 of the agricultural experiment station of the University of California.

The summary which gives the gist of the book is quoted in full:

"The citricola scale is one of the economically important citrus insects of California.

"It is at present distributed over widely separated localities and in some sections is spreading rapidly.

"The young appear by the last week in April and continue to appear until August.

"During the summer, fall and winter the scales are found on the leaves almost exclusively and grow very slowly.

"In November, and later, a few migrate back to the twigs but the greatest migration occurs in March.

"With the warm weather of spring they rapidly mature and begin to deposit eggs late in April.

"One full year is thus required, usually, for the life cycle.

"Fumigation between July 15 and September 15 is the most satisfactory treatment. Fumigation results are less certain later in the year.

"Where fumigation is not feasible, spraying, as explained in the text, may be employed."

THE CITRUS INDUSTRY OF SOUTH AFRICA

Written for California Cultivator
By Carl Nichols.

CITRUS growing in South Africa, although a comparatively new industry, is becoming of considerable importance, especially in the Transvaal. The following brief account of the industry may therefore prove of interest to California citrus growers. Most of the information was obtained by correspondence with Mr. R. R. Davis, chief of the division of horticulture, department of agriculture, Union of South Africa, Pretoria, Transvaal, and with Mr. Chas. E. Farmer, citrus adviser, British South Africa Company, Salisbury, Rhodesia.

History of Industry

Interest in the citrus industry of the Transvaal first had its inception in the year 1906; in that year the possibility of a large output was first recognized. In 1906 the Royal Horticultural Society of London held an exhibition of all kinds of fruits which could be shown during the month of June, this exhibition being open to all the British colonies. The exhibit from the Transvaal was collected and packed by Mr. R. A. Davis. In competition with six other colonies this exhibit was fortunate enough to secure almost every medal and first award given. Mr. Davis was so pleased with the results that he secured a small grant from the government, began to purchase oranges from the growers and to export in the holds of the mail steamers which sailed weekly. The prices realized were sufficiently satisfactory to induce others to follow the example set, and that year some 3,000 boxes were exported. From that time the exports increased until in 1913 40,000 boxes were shipped. During 1914 up to the commencement of the European war still greater quantities were sent away; the war has, however, interfered with the regular sailings of the mail steamers, which are now devoted to other work.

Until within the last seven or eight years no named varieties of oranges were grown, the export trade consisting almost wholly of seedling fruit. Now the superior named varieties are being planted, and as better fruit is produced better prices are received. As a consequence the planting of citrus trees on a scale not heretofore dreamed has commenced.

Regions and Climate

Citrus fruits can be grown over three-fourths of the whole of South Africa. The higher inland plateaus which are characterized by intense cold in winter are about the only unsuitable parts. The coast districts have little or no frost; the summer temperature seldom rises above 95 degrees Fahrenheit and this region is characterized by high winds. The average rainfall is about 33 inches. Farther inland frosts do occur, winter temperatures sometimes falling to 10 degrees Fahrenheit. Summer temperatures inland reach 110 degrees Fahrenheit as a maximum, with occasional spells of three days' duration up to 115 degrees Fahrenheit. High winds inland are not common except in August and September.

Soils

The soils vary from light red sandy loams to dark chocolate soils of the same character. Towards the south

coast are alluvial deposits extremely deep and rich and still being added to each year by the overflow from the rivers. Sandstone, granite and quartz rocks predominate.

Acreage Production, Etc.

Accurate statistics are being prepared at the present time as to the citrus acreage, but these are not yet ready. The approximate production is as follows: Oranges, 1,000,000 boxes; mandarins and tangerines, locally known as Naartjes, 350,000 half straps. Practically all citrus exports go to England, the approximate value of the same in 1913 being about £18,000, or \$87,480. Mr. Davis believes that the expansion of the citrus industry in South Africa has no limit except insofar as it is influenced by the ability of the European nations as consumers.

Varieties

Most of the recent plantings consist of Valencia Late and Washington Navel oranges. There are some plantings of the Du Roi, Pineapple, St. Michael and Jaffa varieties, with some extra good seedlings here and there. Mr. Davis states that some of the old seedling trees in the Transvaal bear exceedingly fine fruit.

Irrigation, Fertilization

Irrigation water mostly comes from springs and rivers. Wells as we see them in California are seldom found in South Africa. There is only one instance of oranges being watered from an artesian well, this well or series of wells occurring around the crater of an extinct volcano. Many of the farms in South Africa are 7,000 to 10,000 acres in extent, and in such large pieces of land favorable situations are often found for damming up water in large reservoirs, and this is a common procedure.

The fertilization of citrus orchards is still little practiced beyond the application of barnyard manure. Cover crops are coming into use in some orchards.

Frost Protection

This seldom has to be resorted to except in the case of young trees which are protected in winter when necessary by covering with long grass; soil is also sometimes heaped around the roots.

Insect Pests and Plant Diseases

The most serious insect pests are the fruit fly, *Ceratitis capitata*, the Natal codlin moth, *Euarmonia batrachopia*, and the various citrus scales. Root rot and collar rot are the two most serious citrus diseases.

People Engaged in the Industry

The bulk of the people in the Transvaal are of Dutch extraction, but recent large undertakings are in the hands of people of British descent. The labor problem is rather unsatisfactory, as the white people do not like to work. Colored labor is usually resorted to. Mr. Davis has occasionally induced white girls to take up the packing of fruit and believes that in time matters will improve.

Cooperative Societies

There are once or two local cooperative societies, which grade, pack, and market the members' fruit, but there is no general exchange such as the California Fruit Growers' Exchange.

Citrus Growing in Rhodesia

At present the citrus plantings in Rhodesia are small, due partly to the lack of sufficient trees in local nurseries. Two nurseries have been established and will be able to supply the demand for trees during 1915. As soon as the supply of nursery trees becomes sufficient, plantings will without question greatly increase. In 1914 two groves of about 60 acres each had been laid out on commercial lines. Almost every farmer has a few trees, from 50 to 100, planted about the yard for domestic use.

Exports

Much interest was taken in growing fruit for export in 1914. Small trial shipments exported to London in 1913 were very favorably received and Valencia Lates in October brought good prices in competition with the first arrivals of Jamaican fruit.

Varieties

The chief varieties of citrus trees

John Deere Implements

Van Brunt Single Disc Grain Drills

Plant any small grain, from alfalfa to bearded oats, corn and peas, even in trash, gumbo or mud.

Van Brunt Drills never choke. Adjustable gate force feed compels an even, continuous flow through each seed tube. Amount sown regulated simply by moving a lever.

Seed is planted at even depth. Individually adjustable springs enable you to give each furrow opener the required pressure for hard or soft ground to make furrows of even depth, and the seed is placed at the bottom of the furrows. All of the grain is up and ready for harvest at the same time.

Van Brunt Drills are light weight, light draft, well balanced and strong. Frame is rigid; hopper does not sag; the gear drive is positive (each wheel drives half the feeds) and the disc bearings are guaranteed to last lifetime of drill. Spring steel scrapers keep the discs clean.

Write us for free booklet, "John Deere-Van Brunt Single Disc Drills." It tells why the Van Brunt plants seed at bottom of furrows of uniform depth, and what this means to you.

John Deere Spreader

The Spreader with the Beater On the Axle

The beater—the business part of a spreader—and all its driving parts, is mounted on the rear axle. This is a patented feature. You cannot get it on any other spreader.

The beater on the axle means there are no clutches to give trouble, less than half the parts heretofore used on the simplest spreader, big drive wheels and a low down spreader without stub axles. Only hip high to the top.

New Revolving Rake

In addition, the John Deere Spreader has a revolving rake that delivers an even amount of manure to the beater. It keeps the beater clear and working free. It works entirely independent of the rest of the spreader and assures uniform spreading. It decreases—not increases—the draft. Another exclusive feature.

Call on nearest John Deere dealer and see the spreader with the beater on the axle. Write for "Farm Manures and Fertilizers," a valuable text book free.

John Deere Publicity Department, Moline, Illinois

A New Book Free

Just Off the Press

Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions. It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements: Steel plows, cultivators and harrows; corn planters, disc harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side delivery rakes; motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasoline engines.

To get this book free, state what special implements you are interested in and ask for the book as Package No. X-111.

Deciduous

Fruits

CROP REPORTS

CHIEF Deputy George P. Weldon of the state horticultural commission writes regarding condition of fruits on July 1 as follows:

Almonds: Alameda County, 45 per cent of normal crop; Butte, 70 per cent; Colusa, 60; Contra Costa, 80; Fresno, 100; Glenn, 100; Lake, 75; Los Angeles, 75; Madera, 100; Mendocino, 80; Merced, 100; Monterey, 75; Napa, 80; Nevada, 100; Placer, 75; Riverside, 100; Sacramento, 85; San Benito, 100; San Joaquin, 75; Shasta, 50; Sonoma, 75; Stanislaus, 100; Sutter, 75; Tehama, 100; Tulare, 90; Ventura, 100; Yolo, 75; Yuba, 70.

Apples: Butte County, 30 per cent of normal crop; Contra Costa, 80; El Dorado, 70; Glenn, 100; Humboldt, 85; Inyo, 40; Kern, 60; Lake, 50; Los Angeles, 100; Madera, 50; Mendocino, 75; Monterey, 60; Napa, 75; Nevada, 25; Orange, 60; Placer, 75; Riverside, 65; Sacramento, 100; San Benito, 100; San Bernardino, 75; San Diego, 25; Santa Barbara, 100; Santa Clara, 70; Santa Cruz, 70; Shasta, 50; Siskiyou, 80; Sonoma, 75; Stanislaus, 75; Sut-

nardino, 95; San Joaquin, 100; Santa Clara, 85; Shasta, 90; Sonoma, 100; Stanislaus, 76; Sutter, 65; Tehama, 75; Tulare, 100; Yolo, 100; Yuba, 100.

Peaches, shipping: Butte, 85 per cent of normal crop; Contra Costa, 90; El Dorado, 85; Fresno, 70; Inyo, 50; Kern, 95; Kings, 100; Los Angeles, 100; Madera, 80; Mendocino, 80; Merced, 75; Monterey, 60; Napa, 80; Nevada, 100; Placer, 100; Sacramento, 80; San Bernardino, 95; San Diego, 100; San Joaquin, 100; Santa Clara, 85; Santa Cruz, 60; Shasta, 90; Sonoma, 100; Stanislaus, 70; Tulare, 100; Yolo, 100; Yuba, 100.

Pears: Alameda County, 70 per cent of normal; Colusa, 100; Contra Costa, 65; El Dorado, 60; Glenn, 100; Humboldt, 80; Inyo, 50; Lake, 80; Los Angeles, 90; Mendocino, 65; Monterey, 60; Napa, 50; Nevada, 90; Placer, 50; Riverside, 75; Sacramento, 80; San Benito, 50; San Bernardino, 50; San Diego, 25; San Joaquin, 100; Santa Clara, 65; Santa Cruz, 50; Shasta, 20; Siskiyou, 100; Sonoma, 75; Stanislaus, 70; Sutter, 75; Tehama, 25; Yolo, 70; Yuba, 100.

Plums: Alameda County, 80 per

Dry Yard Scene

ter, 80; Tehama, 50; Tulare, 90; Yuba, 100.

Apricots: Alameda, 65 per cent of normal crop; Colusa, 100; Contra Costa, 70; Fresno, 75; Glenn, 90; Imperial, 80; Inyo, 55; Kern, 85; Kings, 100; Lake, 75; Los Angeles, 75; Madera, 75; Mendocino, 100; Merced, 75; Monterey, 25; Napa, 75; Nevada, 80; Orange, 25; Placer, 70; Riverside, 100; Sacramento, 85; San Benito, 75; San Bernardino, 95; San Diego, 100; San Joaquin, 100; Santa Barbara, 80; Santa Clara, 70; Santa Cruz, 50; Shasta, 75; Sonoma, 100; Stanislaus, 60; Sutter, 90; Tehama, 90; Tulare, 75; Ventura, 75; Yolo, 70; Yuba, 70.

Figs: Colusa, 100 per cent of normal crop; Fresno, 100; Glenn, 100; Kern, 100; Madera, 100; Merced, 100; Nevada, 100; Shasta, 75; Stanislaus, 100; Sutter, 100; Tehama, 75; Tulare, 100; Yolo, 90; Yuba, 100.

Olives are reported from nearly everyone of the larger producing sections as practically 100 per cent of normal.

Peaches, canning. Butte County, 85 per cent of normal crop; Contra Costa, 90; Fresno, 70; Kern, 95; Kings, 100; Lake, 75; Los Angeles, 100; Madera, 80; Mendocino, 80; Merced, 80; Napa, 85; Nevada, 100; Orange, 100; Placer, 100; Riverside, 100; Sacramento, 85; San Benito, 100; San Bernardino, 95; San Joaquin, 100; Santa Clara, 85; Shasta, 95; Siskiyou, 80; Sonoma, 100; Stanislaus, 90; Sutter, 75; Tulare, 100; Yolo, 100; Yuba, 100.

Peaches, drying: Butte County, 85 per cent of normal; Colusa, 60; Contra Costa, 90; Fresno, 70; Glenn, 100; Inyo, 50; Kern, 95; Kings, 100; Lake, 75; Los Angeles, 100; Madera, 80; Mendocino, 80; Merced, 75; Napa, 85; Placer, 100; San Benito, 100; San Ber-

nardino, 95; San Joaquin, 100; Santa Clara, 85; Shasta, 90; Sonoma, 100; Stanislaus, 76; Sutter, 65; Tehama, 75; Tulare, 100; Yolo, 100; Yuba, 100.

Prunes: Alameda County, 65 per cent of normal; Butte, 40; Colusa, 100; Contra Costa, 60; Glenn, 100; Inyo, 75; Kern, 100; Kings, 100; Lake, 75; Madera, 65; Mendocino, 100; Monterey, 90; Napa, 90; Nevada, 90; Riverside, 100; Sacramento, 85; San Benito, 75; San Bernardino, 100; San Joaquin, 30; Santa Clara, 65; Santa Cruz, 75; Shasta, 85; Siskiyou, 100; Sonoma, 60; Stanislaus, 90; Sutter, 75; Tehama, 80; Tulare, 80; Yolo, 80; Yuba, 100.

Walnuts: Colusa, 100 per cent of normal; Contra Costa, 100; Glenn, 95; Lake, 75; Los Angeles, 100; Napa, 80; Nevada, 50; Orange, 100; Riverside, 100; San Benito, 100; San Bernardino, 100; San Joaquin, 80; Santa Barbara, 100; Shasta, 80; Sonoma, 75; Stanislaus, 100; Ventura, 110; Yuba, 100.

SPRAYING WALNUTS

"Spraying for the Control of the Walnut Aphis" is the title of Circular 131, by A. R. Taylor, published by the agricultural experiment station of the University of California. The circular opens with the statement that the European walnut aphis is said to occur in all parts of the world where the English or Persian nut is grown. In California there is no section free from this pest. The conclusion of the author is that the most effective control is secured by the use of lime sulphur spray in the winter and tobacco

extract spray in the summer. It has been found that the average cost of winter spraying of very large trees is not far from 75 cents.

DRIED FRUIT INSECTS

The department of agriculture at Washington has just issued Bulletin No. 235, "Control of Dried Fruit Insects in California." William B. Parker of the entomological division has been in California making investigations for some years. This bulletin of 16 pages is the result of his work. It touches upon insects which infest dried peaches, apricots, prunes, raisins and other fruits. The illustrations show several of our fruit pests and fruit which has been injured by them, also full illustrations of new types of cartons which can be used in packing fruits, even in 50-pound packages, so that they will be protected from the attacks of these insects.

We quote entire the page which gives the summary and conclusion:

"A considerable financial loss due to the infestation of dried fruit is experienced by packers, wholesale men, and retail dealers.

"There are several species of insects which attack dried fruits on the Pacific Coast, but of these the most common and destructive are the Indian-meal moth and the dried fruit beetle.

"Infestation takes place in the packing house, in the warehouse, and in the grocery store. The insects find their way to the fruit through small cracks in the boxes and between the folds of the paper.

"All insect life is destroyed in fruits that are put through the boiling dip, and the processing of other fruits can be accomplished by the addition of the belt heater to sterilize all fruit so treated.

"The use of an insect-free packing room and sterilized cartons or containers which are sealed before being placed in the warehouses or cars will protect the fruit from infestation unless the package is broken.

"There are several cartons and methods of sealing that can be applied to dried fruit, but their cost will determine their practicability.

"The secret of preparing an insect-free package of dried fruit is to sterilize it at a temperature of 180 degrees Fahrenheit and protect it from future infection by the use of the insect-free packing room and sealing in sterile cartons or packages.

"The sealed carton not only protects the fruit from infestation, but it prevents it from drying out and preserves it for long periods in the moist and attractive condition in which it was packed.

"Moist fruit can be successfully packed in sealed cartons, provided attention is paid to the moisture content. The fruit must be carefully drained and must not be packed too hot.

"Machines have been invented which will successfully wrap and seal small packages of dried fruit at a moderate cost per thousand.

"It is probable that the time is coming when it will be as necessary to put up dried fruit in sealed packages as it is to pack cereals in that form today."

DON'T DRY WINE GRAPES

Manager James Madison of the Associated Raisin Company has issued a letter urging growers not to dry wine grapes. He says:

"It is undoubtedly known to all raisin growers, and we trust to all grape growers as well, that the California Associated Raisin Company is using its best efforts and endeavors to put the very best raisins on the market in the most attractive shape, thereby hoping to increase the consumption. Therefore it is with some apprehension we have read in the papers that the wine manufacturers will not be able to use as many grapes as formerly and have advised all the grape growers to dry their grapes, which would naturally mean that there would be an overproduction of raisins, and the largest part of this additional production would be of very inferior quality.

"We therefore desire to advise the grape growers that for the purpose of preventing a large quantity of inferior raisins being put on the market we are endeavoring to make arrangement with the wine manufacturers so that all such grapes which it may be

possible to dry for raisins will be made into wine and have hopes that some arrangement to that effect can be made. Even if we should fail in our efforts, we would urge all grape growers that no grapes be dried except first crop Muscats (this has no reference to Thompsons or Sultanas).

"This is for your own protection for the future as this company cannot compete with its first class raisins against a large quantity of inferior dried grapes that may be placed on the market."

NATIONAL FERTILIZER ASSOCIATION

The National Fertilizer Association is holding its 22nd annual convention at Hot Springs, Virginia, this week. The members are discussing the relation of the fertilizer industry to agricultural and industrial development, fertilizer control laws, various scientific questions affecting soils and fertility and, of course, to be popular will also discuss the need of rural credits as well as many other questions affecting the fertilizer industry of the United States. Gustav Jarecki of Cincinnati is president and W. G. Sadler of Nashville is secretary.

NINETY AND STILL FARMING

Wm. Guilford of Orland, Glenn County, claims to have the prize English walnut tree and the most prolific Thompson Seedless grape vine in the state. And Mr. Guilford is probably the oldest active fruit grower in the state. He celebrated his 90th birthday in June and Mrs. Guilford was 86 the same month. On one stem of a heavily loaded English walnut tree there are 12 big nuts, and on a one-year-old Thompson Seedless vine there are over 50 big bunches of grapes. These walnuts and grapes—and oranges and lemons and berries and all manner of California fruits and vegetables—are a testimonial to the possibilities of water and cultivation on heavy clay land that was at one time considered of little value. There are thousands of acres of this heavy land in the Sacramento Valley that are very fertile and will some day be productive; when the labor that is required to till them properly is available.

PREPARATION OF SEED BED FOR CORN

A large number of farmers are planting a few trial patches of corn. Many of these will fail in their summer's trial, largely because the seed bed has not been properly prepared. Professor Geo. Severance, Agriculturist of the state experiment station at Pullman, gives the following recommendations in regard to the preparation of the seed bed.

It must be remembered that the growth of the young plants will depend largely upon the supply of food they secure, and that this food is secured through the root system of the plant. It is necessary, then, that the corn plants make a rapid and complete development of this feeding system.

The root system is extremely delicate and contains such an immense number of small rootlets and root hairs, when properly developed, that no space, even as small as a pea, can be found in the upper part of the soil that does not contain some of these root hairs. For such development it is necessary that the roots do not come in contact with hard clods. The entire furrow under the mulch should be thoroughly pulverized.

Where the land has not been plowed until the time to plant corn, nor the surface disked to hold the moisture, the furrow breaks over in chunks. If the surface is then worked only with a smoothing harrow, the bottom of the furrow where this root system must develop is in no condition for proper development. Soil in this condition at the time of plowing should be disked before plowing and be worked with some form of compacting and clod-mashing tool after being plowed and disked, in order to work the soil deeply enough.

Every root hair should come in contact with soil grains, hence the furrow should be well worked down, leaving no large holes, as is usually the case with late plowed land, particularly if considerable straw, stubble or other trash has been plowed under.

This is also necessary in order to insure a good supply of moisture. The

presence of large air spaces permits the rapid drying out of the soil, and breaks the capillary connection with the soil moisture beneath, so that the young plants in the seed bed are deprived of the moisture they must have.

Many farmers reason that because the corn is a cultivated crop they may save time by planting the corn and

condition at the outset to enable them to develop quickly and extensively, so that there will be no check in weaning from the mother seed.

Furthermore, the future cultivation does not fit the soil directly about the hill where the plant in its tenderest stage is obliged to draw its food.

If the ground is to be properly pre-

If the land is not fall plowed, the next best thing is early spring plowing. But whether plowed in the fall, early spring, or late spring, the fact must not be overlooked that the seed bed must be thoroughly prepared before planting if complete success is expected.

One of Eldorado County's Hillside Orchards

fitting the ground later. This is entirely wrong.

The first growth of the plant is from the limited amount of food supply stored in the seed. This will keep the plant but a few days. It must then draw its food from the soil. If the young, delicate plants are to make a vigorous growth from the start, the roots should find the soil in proper

pared for corn, it should have been plowed last fall so that the moisture may have been completely absorbed and the furrow settled by the winter rains. This has the further advantage of letting the weeds start in the early spring so that they can be largely cleaned out before the corn is planted. It also encourages the development of valuable food.

An agricultural cooperative society with 200 members known as the *Economia Agricola*, has been formed at Casilda, in the province of Santa Fe, Argentina. The society proposes to store and sell the produce of its members, dealing directly with exporters. It has sheds and machinery for shelling corn.

ATTENTION ALMOND GROWERS

One shipment of a train load of READ SURE POP ALMOND HULLERS & SEPARATORS shipped July 30th, 1912, by the Schmeiser Manufacturing Co., Davis, Calif.

Reports show excellent prospects for a better than normal crop of almonds this year, and we are already feeling the effects of this news on our sales of

Read "Sure Pop" Almond Hullers

which we manufacture. At the last minute there will be a rush as usual, and every one will want immediate shipment.

Are You Going to Buy a New Huller?

There is so much money tied up in complete machines that we will not finish them except on order, but we are in a position to assemble on reasonably short notice. WRITE AT ONCE for our terms and your letter will be given prompt attention. Our suggestion is that your order be placed early so that you may be sure of delivery on the date you need the machine.

PRICE LIST AND CAPACITY

No. 1—2 to 3 tons capacity, \$1250.00 f.o.b. Davis.

No. 2—1½ to 2 tons capacity, \$750.00 f.o.b. Davis. (Special picking arrangement in tailing spout, \$50.00 extra.)

No. 3—¾ to 1½ tons capacity, \$100.00 f.o.b. Davis (Note: No. 3 is a hand machine, but can be operated by motive power. It has no separating attachment, consequently the sorting must be done by hand). SEND FOR PARTICULARS AND ANY OTHER INFORMATION.

Schmeiser Manufacturing Company, Davis, Cal.

LOOK!

On two adjoining ranches under identical conditions the same amount of water was pumped. One owner used electric power. The other used a COMMERCIAL GAS ENGINE. Electric power cost the one \$1800 a year. The other bought \$400 worth of distillate and at the end of the year had \$160 worth of distillate unused, making a total power cost of only \$240, an actual instance of saving money that should make you write for further particulars. Do it now!

on the Farm

AUTO TRUCK MAKES FARMER A BUSINESS MAN

By George F. Whitsett, of the International Harvester Co. of America.

WONDER is expressed by some that motor trucks are becoming used on the farm. Many who are unfamiliar with present rural conditions imagine that development is peculiar to the city, and that farming conditions are the same yesterday, today and forever.

It is inevitable that as the nature of farming itself changes, the machines of the farm will display a corresponding change. Agricultural need always precedes the machine which fills it.

Tell me what kind of farming a man does and I will tell you what kind of delivery he uses, or will use within the next few years. The farmer who has graduated into some one of the numerous specialized forms of farming—the kinds that put fertility back into his farm and daily profits into his pockets will find motor truck delivery necessary in his business.

There appeared recently in the Pennsylvania Farmer an account of one instance of motor marketing which nicely illustrates the new regime. S. L. Kester of Clearfield County, Pennsylvania, has used a motor truck to his profit and convenience for two years in conveying his produce from Homestead Farm to market.

"He produces fruit, berries, garden products, butter and eggs," says the account. "The products are carried more safely and arrive in better condition than when hauled in a market wagon. About one-third as much time is spent on the road and one team is dispensed with. Towns that were practically out of reach by team are within easy distance of motor truck."

The writer prefaces his remarks on Mr. Kester's delivery success with this statement: "The number of users of the motor truck for marketing purposes is rapidly increasing and their success bids fair to make this method the popular one for conveying farm produce to market. As a saver of time and horses it is economical."

And this is the age of all ages, and the year of all years, when economy is an argument. With shrapnel shooting the price of horseflesh skyward the specialized farmer as well as the city merchant will listen to arguments for economy. Financial and economical crises are beneficial in that they force us to substitute for our extravagant ways methods which will stand the test of profit and loss.

When we consider the advantages of farm marketing by motor as compared to the advantages of city gasoline delivery, it is hard to see why the city man beat his country brother to the method. The man in town has better streets and shorter hauls, yet he was first to adopt motor truck delivery.

But the difference is fast disappearing. Rural competition is increasing, and ways and means for increasing the speed and decreasing the cost of delivery are becoming as popular among the orchards, lettuce fields and poultry farms of the countryside, as they are among the manufacturers, wholesalers and retailers who make their deliveries over brick pavements and asphalt.

The man who raises berries and fruit soon comes to wonder how he ever managed to stay in business with his old-fashioned methods of delivery. His motor truck enables him to rise later in the morning and get to market at the customary time. It enables him to gather his tender fruit, such as berries and peaches, in the cool of the day, and get it to market or shipping point the same afternoon. It not only moves him up closer to his customary market, but puts him within easy striking distance of other markets.

These conditions apply with equal force to the producer of truck and garden vegetables. The motor truck makes the raiser of radishes, green peas and roasting ears master of his early morning marketing. It lets him

get as much sleep as every man deserves and yet enables him to get into market before it already is glutted. It makes him independent of local buyers and enables him to go where he can get the best prices and conditions. Furthermore it enables him to get there more easily, quickly and economically.

Every man who produces milk, cream, butter or cheese to any extent is, or soon will be, the owner of a motor truck. It gives him the power and speed necessary to make quick deliveries in the cool of the day and cover, if necessary, long distances. The motor truck as now built will travel over all kinds of roads in all kinds of weather and will surmount any hill. The motor truck has become an all-year proposition and one which will relieve the dairyman of the tortures of slow and tiresome delivery.

The poultry farmer is a natural member of the motor truck club and finds that his business can be handled with alacrity and economy by the aid of gasoline. It enables him to market daily when desired and to answer and to fill special orders on short notice. It makes a full-fledged business man out of the otherwise handicapped poultry farmer.

A farmer need not be an all-fruit, all-vegetable, all-dairy or all-poultry farmer to come in under the classification of those who need specialized delivery. Being engaged in several lines of specialized farming does not keep a man from being a candidate for specialized delivery.

No one need be surprised then to observe an increase in the number of motor trucks purchased for farm use. As the kind of materials marketed changes, the means of marketing will differ. The more farmers who become engaged in specialized farming of any sort, the more farmer owners of motor trucks will there be. What is more, motor truck delivery holds as it grows. More than 99 per cent of all who take up motor truck delivery keep it up and never go back to the ways of their forefathers. The motor truck builds up the very businesses which demand it and therefore becomes a self-perpetuating species.

POINTS TO CONSIDER IN A STRANGE REGION

The man who takes up a farm business in a community with which he is not familiar is likely to fall into error on matters seemingly very simple to the residents of the region. The new man often follows the planting dates of the region from which he came, and thus the crops may be injured by early or late frosts or other climatic conditions especially prevalent in the region.

In southern New England such a case was observed the past year. A farmer new to the region, not realizing the shortness of the growing season, had planted his corn too late to mature properly, with the result that but 15 bushels were husked from nine acres and a large part of his fodder was lost by heating. This individual is there to make the farm a paying proposition, and as fast as possible is correcting his errors.

Accurate climatic data are often of great value to a farmer starting out in a strange neighborhood. Tables showing the dates of the last killing frosts in the spring and the first in the fall, together with rainfall by months and total rainfall for the region, are usually available from the United States weather bureau, Washington, D. C. These should be consulted before deciding on the crop practice for the new locality. It would be still better to obtain such information before deciding upon a locality in which to purchase a farm.

Another mistake which is often made is through the endeavor to bring the type of farming of the old region to the new location, where, in the majority of cases, not only different conditions of soil and topography prevail, but new problems relative to

transportation and market demands are met. These new conditions determine the profitableness or unprofitableness of the type for the region. The general type of soils of the neighborhood should be studied and compared with the soils of the individual farm and crops planted which are best adapted to soil and topography of the farm as shown by the general farm practice of the neighborhood. As a general rule, it is the safest practice for any farmer starting out in a new location to grow largely the same crops and keep the same breed of livestock as his neighbors, unless there is an especially good reason for following another practice. As one grows familiar with the region, experience may suggest improved methods.

If farmers, when changing to a region with which they are not familiar, would give more thought to climatic and soil requirements as shown by the type of farming and planting dates generally practiced in the new neighborhood, many hardships and disappointments would be prevented.—L. G. Howell.

AGRICULTURAL ENGINEERS

The American Society of Agricultural Engineers will meet in San Francisco, September 21, 22. The meeting will be in conjunction with the International Engineering Congress which will be held at the exposition.

Along the line of agricultural engineering, which has many lessons for visitors at the world's fair, Mr. Leonard Carpenter gives us the following hints as to some features which will be of interest to farmer attendants.

In the Palace of Agriculture are all of the machines for agricultural purposes, and to supplement these are the exhibits in the Palace of Food Products. Both of these palaces are seven and a half acres in extent of floor space and they are filled with exhibits.

Seven great manufacturing companies are showing their farm tractors. These machines are shown in whole and also the working parts are exhibited, and trained men are in all of the spaces who explain the workings of their own machines.

The Holt Company has a model farmhouse with a growing orange orchard and an attractive exhibit of their tools. The machines have been mounted so that they are shown in operation.

The International Harvester Company shows all of its tools, including tractors.

Milking machinery, dairy, barn and creamery appliances, gasoline engines, and all other farm power appliances are exhibited in operation.

There are a number of model farms. The United States Steel Corporation shows the Apollo Farm with sheet iron houses, barns and out-buildings, an irrigation system with iron flume, fences and a complete line of steel utensils.

Idaho shows the Horse Shoe Dam with real water and an irrigated farm with all of the different methods of putting the water on different kinds of crops.

The department of agriculture shows an 80-acre model farm with irrigation and the different methods of drainage. In this exhibit are also methods of construction of cold storage houses, slaughter houses and smaller farm buildings. The proper relation of fields to buildings, and buildings to the surroundings, such as roads, schools, etc., is shown in the model farms both here and in the other exhibits.

The different irrigation projects, private and government, are fully illustrated.

Many interesting types of foreign tools are shown which compare with our own makes.

SCORED FOR THE CAT

Billy has a kitten and his little neighbor has a poodle, and both little boys often quarrel over the relative merits of their pets. One morning the owner of the little poodle dog was getting the best of the argument, for his pet had a bath each day, he declared, and therefore was much cleaner than the kitten. But a bright idea saved the day for Billy. "Huh," he indignantly burst forth. "My kitten dry cleans himself four or five times a day."—Exchange.

Panama-Pacific Exposition Night Illumination. View from Main Entrance. The Jewel City is Wonderfully Beautiful at Night.

EVENTS THIS WEEK

SCIENTISTS, historians and specialists the world over are gathering. Conventions of men, conventions of women, even conventions of children continue to assemble.

August is the greatest month of all for conventions. In that month there will be 249. But July with 133 has a sufficiency, for on some days there are dozens of different conventions in session. Agriculture is coming to its own. There will be within the next few weeks 34 agricultural and horticultural conventions and in addition to these 38 devoted to live stock. Educational people seem to be the strongest for conventions for we note they are scheduled for 89 to be held within a short time. Neither September nor October fall much below July, so California is to be well conventioned this year.

Next Sunday, July 18, is Christian Endeavor Day.

Monday, the 19th is Universalists' Day, also the day of the American Asiatic Association and Evangelical Lutheran Synod, Historical Congress, International Association Rotary Clubs, Fraternal Brotherhood. On this day there will also be contests in swimming, water polo and other athletics.

Tuesday, the 20th, is Epworth League Day, American Historical Conference on Mothers' Pension Day.

Wednesday, July 21, is Electrical Contractors' Day, Physical Educational Association Day.

Thursday, the 22nd, is Cleveland Day, also the day of the National Association of the Deaf.

Saturday, the 24th, is Illinois, Utah, Detroit and National Electrical Contractors' Day.

The following week there will be meetings of the American Academy of Political Sciences, Archaeological Institute, Entomological Society, Biological Society, Mathematical Society, Society of American Bacteriologists, Astronomical Society and many other important organizations.

The midsummer season is on and the attendance is increasing with every trainload which comes in from the East.

The exposition has been giving some wonderful treats to music lovers. John Phillip Sousa and 65 musicians are charming thousands. In addition there is the Boston band with 65 players; the Philippine Constabulary band of 90, giving daily concerts, the Marine band and Cassasas Official Exposition band.

Of course there are daily recitals on the exposition's \$50,000 organ in Festival Hall; also daily concerts by the exposition orchestra of over 80 pieces.

Another musical attraction which is promised for July 21-24 is the Tabernacle Choir of Ogden, Utah. Two hundred voices under one of the best leaders promises a rare treat.

EXPOSITION POULTRY SHOW RULES

Entries for the poultry show to be held at the exposition November 18 to 28 will be received and cooped for exhibition on November 16 and 17. The exhibition period and time occupied in judging and reshipping the birds will be from November 18 to 28. Entries close on October 15 so all breeders should decide on the number of cocks, hens, cockerels, pullets and pens they wish to enter before that date. It is not necessary to decide on the exact individuals, but exhibitors should decide on the number and sex and select new bands to be put on them at the time of shipment.

Entry Fees

A fee of \$1.50 for each single and \$4.00 for each pen will be charged to cover the expense of receiving, cooping, feeding, watering, exhibiting and returning the birds. Breeding pens will consist of one male and four females and birds entered as singles cannot compete in pens. Entry blanks can be secured from the department of live stock.

Prizes in the poultry classes will be paid in full where there are four or more entries in a class, and where there are less than four, second money will be awarded to first prize winners.

On all breeds and varieties of poultry recognized in the 1915 edition of the American Standard of Perfection and including guineas and pheasants the following prizes will be awarded:

Cock, hen, cockerel and pullet, to each five prizes, 1, \$5.00; 2, \$4.00; 3, \$3.00; 4, highly commended, 5, commended. Breeding pen, to each five prizes, 1, \$10; 2, \$6.00; 3, \$4.00; 4, highly commended; 5, commended. Ribbons will be given for each award.

One pea fowl, one male and not less than four females, 1, \$35.00; 2, \$25.00; 3, \$15.00; 4, highly commended; 5, commended.

Ostriches, one male and not less than four females, 1, \$100; 2, \$75.00; 3, \$50.00; 4, highly commended; 5, commended.

A utility department will be maintained at a fee of 50 cents per bird. Everyone entering in this class must certify that entry has been bred from pure bred stock.

Fruit growers and nurserymen will have their meeting at the exposition or near there, during the last of July and the month of August. In July the State Fruit Growers will convene at Palo Alto. One feature of this gathering is a day at the Exposition. In August, occurring in the order given, will be the Thirteenth Annual Convention of the Pacific Coast Nurserymen at the auditorium; the Fifth Annual meeting of the California Nurserymen, also at the auditorium; Nurserymen's Day at the Panama Pacific, the 16th; later the annual meeting of the American Rose Society, Society of American Florists, National Association of Gardeners, American Association of Park Superintendents, and finally the Thirty-fourth Biennial Convention of the American Pomological Society. Specific dates and outlines of programs will be given on this page.

THE WEED CAMPAIGN IN KERN COUNTY

IN 1912 a campaign was begun by the horticultural commissioner against some of the most troublesome weeds in the county. At all times it has been the aim of the commissioner to make it an educational and cooperative one, rather than one forced upon the people. At first a large amount of the work was done only to comply with the requests of the commissioner, thinking it would be dropped in a few years, as the squirrel campaign was handled, but since it is being continued the people are now working to permanently eradicate the weeds.

The county was divided into districts, and in each one an inspector was appointed, who makes a thorough canvass of the district, not only notifying the farmers to rid their land of the weeds, but explaining to them the most effective methods of doing so and the importance of the work. The weeds included in the campaign are: the Russian thistle, ground bur nut, sand bur grass and the springy cockle bur.

The Russian thistle, one of the most persistent pests the farmer has to deal with, is found generally throughout the county. It is a serious pest in cultivated crops, but in grain and other uncultivated crops it has no equal, not only crowding out other growth but utilizing the moisture and plant food which is always needed in the grain field. The weed is a dry weather plant which shows up late in the spring, quickly maturing its seed, then in the fall breaking loose from the root and rolling before the wind, spreading the seed broadcast. It is one of the most common weeds along the railroad right-of-way throughout the country, yet they have done as much or more than anyone else in the control of the weed. They have repeatedly cut it each season, but have neglected to thoroughly do the work, especially on the later crops of the season.

The control of the weed is not difficult providing all work is thoroughly done and before any seed has matured. All people in a district must cooperate, for one patch left to mature a crop will reseed all adjacent land. Rotation of crops, clean cultivation, especially along fence lines, roads and all waste places, is very effective. Where hay and grain are grown exclusively the problem is more complicated. After removal of the crop the ground should be cultivated by shallow plowing if the seed has not already matured, but if it is already ripe the only method would be to burn it to prevent it from blowing on adjacent lands, and the next season summer fallow followed by summer cultivation. Where it is found on uncultivated lands where there is a growth of foxtail or other wild grass, burning over the land before the seed has matured, and then cutting any that failed to burn will control the weed.

The ground bur nut, locally known as puncture weed, is another serious pest the farmer has to contend with. It also seems to have spread along the railroad and from there on to the adjacent lands. It is not a serious pest in cultivated fields but is a menace to alfalfa growers. The weed growing close to the ground, similar to wire-weed, makes cutting with a mowing machine impossible, but when the hay is raked the weed is picked up and the burs do large damage in the mouths of stock. It is a serious pest to sheep men, the burs getting into the wool, causing great loss. This being an annual weed it is quite easily controlled in cultivated fields by the regular cultivation, but should be prevented from getting into the alfalfa fields. As a pest along roads, ditch banks, and fence lines it is one of the most serious and should be cut before the seed is

matured, and above all things see that the work is thoroughly done.

The sand bur grass is a common weed throughout the irrigated districts, especially in the light sandy soils. Irrigation water is the one factor in spreading this weed, it growing profusely along the ditch banks and checks where it is spread very rapidly. It first must be cleaned up here before any field work is done if results are to be obtained. The weed problem will be solved when a better system of ditches is obtained, either cemented or oiled, preventing the rank growth of weeds along the banks and preventing sub-irrigation which does great damage in many of the districts.

The spiny cockle bur, while a very serious pest, is fortunately not widespread throughout the county and has a tendency to grow in the wetter lands. It is an annual weed, not very prolific in the production of seed, so is quite easily controlled.

The people should clear the weeds from their land and from all their ditch banks and then insist that all other land owners and the canal companies do the same. The support of the people is what is needed. Clear your land of the weed and insist that others do the same. The commissioner is assisting as far as possible in seeing that all lands are cleared and in making inspection of all incoming seeds to prevent the further introduction of weed pests.—Kern County Farm Bureau Monthly.

CACTUS

In a letter from Mr. C. D. Cummings, who has had much experience in growing thornless cactus, he calls attention to its value as a conditioner and feed for live stock, and to the fact that where it has been added to the ration of cows and hogs they have yielded most satisfactory production.

In addition Mr. Cummings says that in his own experience he has found it to be a most palatable fruit for the table, being both healthful and nutritious.

While the cactus is a native plant of the desert region I find that the domestic cross-bred, improved varieties thrive just as well in the northern part of the state as in the South.

ROBUSTA CACTUS.

Remarkably Thrifty Grower of the
Thornless Type.

They grow fully as prolific in the Sacramento Valley as they do around Los Angeles and San Diego. The better the soil the greater the growth, and they will thrive anywhere where the temperature does not fall below 14 or 15 degrees above zero. At this place, Los Altos, just south of Stanford University, when orange and lemon trees were frozen two years ago the cactus were not hurt at all. In fact they have never been touched by frost here in the five years I have been growing them. They will also grow as far north along the Pacific coast as Oregon and Washington, most of California, Arizona, New Mexico and Southern Texas, and in Louisiana, Florida, and all along the Gulf

and Atlantic coast of the United States well up into South Carolina.

STUMP BLASTING

Stumps offer the same impediment to cultivation and crop production as boulders, and their removal is just as important and necessary. Many thorough tests, covering a long period of time, have proved that the cheapest, quickest, most economical and most satisfactory means of ridding a field of stumps is by the rational use of dynamite. In swamps or wet places where stumping by other means is practically impossible, good results are obtained by blasting, no matter how wet the soil may be or how large and heavily rooted the stumps are. For blasting the several kinds of stumps, it is necessary to load them with special regard to their root systems.

Blasting Tap-Rooted Stumps

Trees similar to the pine, when not interfered with by hardpan, usually send down heavy tap roots. For blasting these, the best method is to start a hole in the ground some distance away from the stump so that it will reach the center of the tap root about fifteen to eighteen inches below the surface of the ground; or deeper, if the nature of subsequent tillage will be interfered with by fragments of stumps or roots left in the ground at this depth. Then using a wood auger, bore a 1½ or 2-inch hole about three-fourths of the way through the root, and load it with dynamite of 40 per cent strength.

As the loading of such stumps will vary considerably, due to the variations in the toughness of the roots, their state of preservation, whether green or somewhat decayed, and the resistance offered by the soil in which they grow, no set rules can be laid down for the amount of dynamite needed for any given size of stump. Fresh green stumps are much harder to blast than similar ones that have been cut for a year or more. The only way to gauge the loading is by experience. Try a few, loading the first one heavier than you feel necessary and later cut down the amount of dynamite used until there is no overloading. It is better to overload a stump slightly than to underload it, for when a stump is once shattered by a charge not large enough to lift it out of the ground, portions of the stump and root are left clinging in the hole and are removed with difficulty.

The novice should begin on the small stumps and work up to the large ones. Take a stump about twelve inches in diameter at the surface of the ground, and start your hole back about fifteen inches, boring to within three inches of the far side of the root. Load this with two cartridges and carefully note the results. If the loading is too light, try more dynamite in the next one; if too heavy, try less.

Blasting Small Fibrous Rooted Stumps

Some classes of forest trees are supported by stumps having no tap root but many heavy lateral roots. These can also be blasted easily. For such a stump the method of loading is to punch a hole under the stump at an angle with the surface of the ground to a depth of about 18 to 24 inches. This hole should be so placed that the major portion of the dynamite is directly under the heaviest part of the stump, and should ordinarily extend decidedly more than half-way under the body of the stump, in order to avoid danger of loading a blast too near the side, and lifting out only a part of it and its roots.

Blasting Large Fibrous Rooted Stumps

When stumps are too large to be successfully blasted by a single charge, the method of loading should be modified as follows: A hole is put down under the stump and loaded as described for small fibrous-rooted stumps, the only difference being that an electric fuse is used instead of the cap and fuse. Additional holes are punched under the large roots and loaded with small charges, each primed with a fuse. The wires are then connected and the shot is fired with a blasting machine.

This method of loading is also recommended for blasting second growth stumps and those having hollow centers, for with such stumps a single charge is quite likely to split the stump without lifting it out.

Stumping in the Orchard

When removing diseased or unprofit-

able trees from the orchard in order to set new ones, all stumps should be blasted out, for by this method they are most economically removed and suitable holes are made for setting new trees.

General Rules for Clearing Land

Most stump land contains stumps of varying sizes from small to large. Where large tracts are to be cleared a good plan is to first blast the small stumps by means of cap and fuse, where only one bore hole is necessary. After this is done the land can be gone over once more, using the electric method of blasting to remove the large stumps where it is necessary to use more than one bore hole to get the best results. A well-trained crew of three men, consisting of a blaster and two helpers, can remove a large number of stumps in a short time. The method is as follows:

The two helpers will start boring holes under the small stumps requiring only one hole. The blaster starts making his primers. When he has made ten or more primers, as the case may be, he begins to load the holes. Loading and tamping can be done much faster than the boring. When the blaster catches up with the helpers who are boring the holes they stop, and all three light the fuses in the loaded holes. When the shots are fired the helpers start boring more holes and the blaster begins to make up a new lot of primers. This system will enable a very large number of small and medium-sized stumps to be taken out in a minimum amount of time, provided the work is not so wet as to make the use of caps and fuse inadvisable. After an acre or two have been cleared up the man can start taking out the large stumps requiring two or more holes by the electric method, if enough be present to warrant the expenditure necessary for the electric equipment.

GROWING ALFALFA SEED

Written for California Cultivator
By J. M. Bomberger

My experience and observations lead me to believe that alfalfa seed may as a rule be successfully grown wherever the alfalfa plant grows well. In my opinion the most important factor in it is the maintenance of the proper proportion of sunshine and soil moisture. Comparatively dry land is usually considered best for growing alfalfa seed, because on such land the alfalfa does not grow so rank as to shut out the sunshine.

On the other hand the best and most profitable crop of alfalfa seed that I have ever seen was grown on very rich, well sub-irrigated soil. On this particular field the stand of alfalfa was very uniformly thin. The alfalfa plants grew very large and rank, but they were just far enough apart to admit plenty of sunshine. I have seen alfalfa plants scattered along a drain ditch, that grew to immense size and seeded heavily. They must have had their toes in the water, but there was plenty of sunshine and they seeded heavily.

A rich, moist soil is not a handicap in growing alfalfa seed if the plants are far enough apart to admit plenty of sunshine; but there is danger in some cases of weeds filling in the open spaces between the alfalfa plants. This might suggest planting alfalfa in rows on such land and cultivating between the rows.

As to which crop is best to leave for seed: If the stand of alfalfa is very thin or if the land is likely to become quite dry early in the season the second crop would be the most profitable, but as a general rule the third crop would be the best to leave for seed.

The watch word in growing alfalfa seed is "sunshine."

CALIFORNIA'S MAGAZINE

One of the most beautifully printed books we have yet seen touching upon California and its attractions is the cornerstone number of "California's Magazine." It is certainly a great credit to the California printing industry. The book is well edited by Prof. E. J. Wickson, and is filled with articles written by specialists. These touch upon the educational side of California, its natural resources, development, plant breeding, waterways, expositions, California's women, California fruits, cooperative marketing, field

products, live stock, food manufacture, the poultry industry, and numerous other factors entering into California's greatness. There are many colored plates showing the perfection to which engraving and printing has been brought. Those of the Panama-Pacific exposition are wonderfully true in color and give an excellent idea of the great exposition.

The book is one which every admirer of California will be glad to send to his friends in the East. There are nearly 700 pages and hundreds of illustrations. Its price is \$1.50. The publisher is the California Publishers' Cooperative Association, New Call Building, San Francisco.

EUROPEAN BEET-SEED INDUSTRY

By Commercial Attache Erwin W. Thompson, The Hague, Netherlands

Many Americans may have wondered why, with the large acreage under sugar beets in the United States, the seed is not raised there. The answer to this is that when beets are grown for sugar they are not permitted to go to seed. The raising of seed is an entirely independent industry and calls for a different kind of talent.

The present sugar beet has been developed by cross-fertilization from an original stock yielding 6 or 7 per cent of sugar up to the present yield of about 15 per cent. This industry has reached its highest development in Germany, where about 50,000 acres are annually planted in beets for the exclusive production of seed. From this area are gathered some 40,000 tons of seed, 10,000 tons of which are used within the empire for planting the area (over 1,000,000 acres) for the production of beets to be used for making sugar; the remaining 30,000 tons are exported. In the calendar year 1913 Germany sent to the United States 5856 metric tons (12,910,300 pounds) of beet seed. Germany produces 2,000,000 to 2,500,000 tons of beet sugar per year and exports about 1,000,000 tons.

Holland's Unique Position

The Netherlands plants about 150,000 acres in sugar beets, which produce about 250,000 tons of sugar, but does not raise any beet seed that enter into commerce. Indeed, that country does not produce the seed used for its own plantings, but has a highly specialized though small industry for the development and production of what might be called "mother beet seed;" that is to say, seed raised for use in planting beets to produce commercial seed. These mother beet seed so produced are carefully examined for germinating qualities. The beet roots that produce them are analyzed from time to time during growth to determine the percentage of sugar, so that in the end only those seed are propagated which show the highest percentage of germination and which are grown on roots producing the highest percentage of sugar.

Much of the mother beet seed produced in Holland is sold to growers of seed in Germany, and large quantities of the commercial seed raised therefrom in Germany are returned to the growers of sugar beets in Holland.

REPAIR YOUR TIRES

"By repairing your cuts you cut your tire bills," says R. S. Wilson, manager of the service department of the Goodyear Tire and Rubber Company of Akron, Ohio.

"A little glass cut, a nail hole, or any abrasion that penetrates the rubber tread to the fabric of the tire, opens a way for dirt and moisture to creep in. In many an apparently perfect tire, when removed from the wheel and deflated, is found a loose tread under which are dirt and moisture, rotting the fabric.

"If you have ever found a tire in this condition you know you have had a strong temptation to call it defective. Did you ever select a nice, rosy apple, apparently a perfect specimen, and discover after the first bite that it was pitted with worm holes? If so you were tempted to call it a poor apple and yet generally investigation would have shown somewhere, down on the side, a small hole where the worm crawled in. Almost without exception the tire having a loose tread and rotting fabric is no more at fault

than the apple into which the worm bored its way. As the tire revolves a suction is produced which draws particles of dirt into the cut. Gradually these particles work under the rubber, grinding and cutting it from the fabric. If neglected this grinding process will work around the tire and separate the whole tread from the fabric. The fabric under the tread soaks up some of the moisture, which causes it to weaken, and a blow-out soon follows.

"A tire cut is the most common and most destructive of all tire troubles and yet is the easiest to remedy if taken in time. It is a good plan to look over your tires every few days. It will pay you to repair any cuts however insignificant they may appear.

"You can do this quickly by cleaning out with gasoline and filling in with repair gum. A can of this is inexpensive and may save many dollars worth of tires and lots of trouble. Rapid deterioration invariably follows a neglected cut."

ELECTRICITY ON THE FARM

Electricity finds a most useful and beneficial application in the farm home for lighting, heating and small motor service. This is quite apart from the now well recognized service as a general utility motive power for outside operations, such as those in the field, barn, dairy, shop, etc. In the newer conception of farm life betterment it is the home and fire-side that require first attention.

As the sewing machine has replaced sewing by hand, so the small electric motor is replacing the foot-power drive. For instance, one cent's worth of electricity at rate of charge of 10 cents per kilowatt hour, will operate an ordinary household sewing machine for two hours and do 30,000 stitches. It was said that each Greek in the olden times required at least six slaves to work for him. How insignificant the twelve hands compared to the simple and direct application of electricity to such a common operation as sewing. And the cost of maintenance of six persons sewing for 10 hours would far exceed one cent.

The same advantages are to be seen in all the other varied demands of the farmer's home for power, as in pumping, laundry, refrigeration, grinding, etc.

In the matter of heating by electricity, moreover, the applications are fully as numerous and economical. One cent will bring to a boil one quart of water and a very small additional allowance will keep it at the boiling point for a long time. One cent's

worth of heat will operate a six-pound flat iron for fifteen minutes or a chafing dish for twelve minutes.

Next, consider the comfort, convenience, safety and security from electric lighting, as one cent will operate a 16-candle power lamp for five hours; and smaller sizes proportionately a longer time.

Electricity in the farmer's home, therefore, reduces the drudgery, as it is called, and makes rural life livable. With the telephone adding a social feature to the preceding economic consideration, it is evident that the day is not far distant when it will be more of a realization than ever before, that the best home life is to be found on the farm, the ranch and in healthful rural environment.—Wm. S. Aldrich, Colorado Agricultural College, Fort Collins.

AGRICULTURAL LABORATORY MANUAL

"Agricultural Laboratory Manual, Soils," by Edward Scott Sell, published by Ginn & Company, Boston, 35 cents.

This is not a text book or discussion of soil conditions but a book of exercises adapted to high schools, especially agricultural high schools and normals. It is intended in fact to be used with text books. It covers such subjects as the origin and structure of soils, soil moisture, soil temperature, crop rotation, fertilizers, bacteria, and tillage. Many of the exercises are to be done in the field so that principles taught in the laboratory may be verified under field conditions.

The method of procedure, which is the outgrowth of long teaching experience, is thoroughly practical. It meets actual class needs and at the same time brings out the fundamental principles in common agricultural practices.

The war conditions are bringing about a more general discussion of the ability of this country to produce its own. Every day brings to light some new product we have been importing which we could well produce in this country. Of course it is usually some thing that requires cheap labor. With America's inventive genius these difficulties may be overcome, at least as to some of the industries. One of our heavy imports, according to state-ments sent out by the department of agriculture, is that of flax in its various forms. We import over \$3,000,000 worth of fiber annually. We also import over \$20,000,000 worth of linen goods. About one-fourth comes from Russia, another fourth from Belgium, but most of our linen comes from Ireland. The department adds "There appears to be no reason why American grown fiber and American manufac-tured linens should not be substituted for at least a large part of these im-ports." The growing of flax and the preparation of fiber requires more or less technical knowledge, but as a rule Americans are able to secure the tech-nical knowledge if it can be shown that there is profit in any industry.

OLEOMARGARINE

Officials connected with the fed-eral treasury estimate that the govern-ment has lost at least \$27,000,000 in stamp and special taxes through frauds by oleomargarine manufacturers. Arrests have been made and fines to the extent of \$48,000 have been im-posed and nearly a dozen other viola-tors of the law are awaiting trial. Pre-sumably it will be a long, long time before the trials of these men are finished and the imposed fines fully collected. Meanwhile oleomargarine

has been manufactured and disposed of as a dairy product. We can have no objection to the manufacturers selling oleomargarine if it is done honestly and squarely on its own merits and not on the merits of the dairy industry. The extent of this industry is indicated to a degree by the fact that the loss from revenue is so great. It means that the con-suming public had been deceived into buying oleomargarine, because it is plain to everyone who has visited stores of various types that oleomar-garine as such is seldom sold. The law was enacted by congress to pro-tect the dairyman. It is apparent that the only effort to protect him was to enact a law and allow it to enforce itself. We hope that something be-sides "imposing" fines will be done to punish these violators of the law.

APPLE GROWERS ORGANIZE

The Watsonville Apple Distribu-tors is the name of the newest cooper-ative marketing organization in the state. The work of bringing the apple growers of the Pajaro Valley under a definite form of organization has been under way for some time, but within the past few weeks the organization has been perfected, and the campaign is still on for new members. There have been several mass meetings at which grower and packer have united in planning for more satisfactory re-turns for their fruit for this season and for the other seasons to come. At a recent meeting delegates were present from other near-by sections, and it is now assured that the greater part of the apple crop of Santa Cruz and Monterey Counties will come un-der this organization. At this meet-ing the state horticultural commis-sioner was present and gave an ad-dress touching upon the pests affect-ing fruits of the Pajaro Valley and emphasized the necessity for only the most perfect pack being sent out. Regarding the new standard apple pack it was recommended that the law be obeyed to the letter. This involves reducing the size of the box used heretofore in the Wat-sonville packing houses. The objec-tion to the Watsonville box now is that it contains 27 cubic inches more space than the box provided for in the standard apple box bill.

The past year has been a trying one upon the apple grower, and the next does not look as bright as de-sired. However, with this organiza-tion and with efficient methods of handling fruit we believe there will be better returns.

STATE CONVENTION

The program of the 46th State Fruit Growers Convention was given in last week's Cultivator. Every fruit grower in the state will find on that program something that will be of most intense interest to him. The convention is to be held at Stanford University at Palo Alto. Sessions will begin on Tuesday evening, July 27, and continue until the evening of Friday, July 30. The next morning the delegates will leave for San Francisco to spend the day examin-ing the horticultural exhibits at the exposition and in the evening listen to addresses in Festival Hall.

The convention offers an opportu-nity that may well be taken advan-tage of by fruit growers even from the most distant parts of the state, for with it is an inspiration, and a few days spent at the exposition will give more information of value

to the grower than may often be secured.

In connection with the Fruit Grow-ers Convention will be held a potato growers convention, or rather, it will be held the two days preceding, al-so at Palo Alto.

As usual the state convention of county horticultural commissioners will also assemble at the same time and place. Probably every county horticultural commissioner in the state will be present, as will also nurserymen who are interested in the horticultural laws and in the methods of their enforcement.

Several bills were passed at the recent legislature which it will be well to discuss at this convention.

AGRICULTURAL SOCIETY

At the Los Angeles meeting of the State Fruit Growers, held last November, steps were taken for the organization of a state horticultural society, or possibly a society which should be more general in its scope. A committee was appointed to con-sider the suggestions made, and this committee recommended that a per-manent committee be appointed to investigate as to the advisability of such organization. That committee later convened in Sacramento in the office of the state horticultural com-mission, and it was the unanimous opinion of the committee that there is an opening in California for a large representative organization which shall have to do with all class-es of agriculture, but being appoint-ed by the officers of the State Fruit Growers Convention it was deemed wise to ask the stock growers and others to unite in the forming of this society. A meeting was called, ask-ing for delegates from every agri-cultural organization in California, to be held at the exposition grounds at San Francisco on February 22. At that meeting were present repre-sentatives of nearly every section of the state and of nearly every branch of agriculture. This meeting as like-ise unanimous in the belief that the time was ripe for the perfecting of a general organization of agricultural interests. It was left to the chair-man of that meeting to appoint a committee to recommend to the next State Fruit Growers Convention at Palo Alto a definite plan of action and constitution and by-laws for such an organization.

This committee, consisting of Prof. H. E. Van Norman, Geo. H. Hecke, Guy H. Miller, Prof. H. J. Webber, C. Thorpe, Geo. C. Roeding and Chas. A. Kimble was appointed and will hold its first meeting in connection with the State Fruit Growers Con-vention at Palo Alto, July 27-30.

The exact form of this organiza-tion—if it is perfected—can only be hinted at, for there are some who believe it should be a representative body controlled by delegates from organized bodies, and that the organi-zation should be supported by the bodies whom it is to serve. Others feel that its membership should be personal and organized on the broad principles of encouraging and caring for all kinds of agricultural activities whether organized or not.

It is an ambitious plan and one which has grown out of a suggestion that a state horticultural society was a crying need of the state. Such an organization will be entirely new, for we believe no other state affords a precedent. California is nothing if not new, and it has sufficient enthu-siasm, ability and initiative to plan for the formation of such a body.

Agricultural Notes

Holland suffered severely in her bulb trade this past year. The pro-hibition of entry of bulbs to the mails in the United States has worked a great hardship on the growers.

The first shipment of watermelons from Sonora, Mexico, was sent to the California market on May 13. The melons were grown by Chinese farm-ers in a small river valley in the south-ern part of the district.

Citrus growers in South Texas have petitioned the United States govern-ment to send an expert to that sec-tion to help the citrus growers pack their oranges, grapefruit and lemons this year. It is expected that their crop this year will reach 1000 car-loads.

By an order, on April 27, 1915, every package containing eggs imported into or passing in transit through Canada must be plainly marked with the word "Produce" and the name of the coun-try from which directly imported, the marking to be done under the super-vision of a customs officer at the ex-pense of the shipper or importer.

Reports from Buenos Aires show that the wheat exportation from Arg-entine for the first four months of the current year was about double that of the same months of the pre-ceeding year, amounting to over 1,500,000 tons. Oats, corn and flour also show a large increase in the current year when compared with the same months of last year, while frozen meats and wool show a decline in quantity, but an increase in price.

The Brazilian press expresses the opinion that the 1915-16 coffee crop of that country will be large, and with the usual markets in Germany, Aus-tria-Hungary and Turkey cut off, there may be difficulty in marketing the en-tire crop at present prices. This leads to the suggestion that the valoriza-tion policy may be persevered in with a loan from the federal government guaranteed by the surtax now set free by the sales of valorization stocks at Hamburg and Antwerp.

Drouth in Australia, combined with the fact that the butter supply of that country is being shipped to England during the war, has opened a new market for California butter. For 60 days California butter has been shipped to the antipodes in quarter-million pound lots. With the sailing of the steamer Ventura on July 10, the amount will total over 2,000,000 pounds, valued at \$520,000. In years past this state has received an im-port of 2,000,000 per year, which served as a check to strong prices for butter and butter-fats. The present price of butter, 26 cents per pound, is largely due to the Australian ship-ment.

One of the most interesting develop-ments of the European war has been the unprecedented growth of South Africa's wool trade with the United States. While there have been occa-sional shipments of wool to America in the past, sales have been comparative-ly small because of the shortness of the fiber. With the cutting off of Ameri-ca's supply of foreign wool through the usual channels, and with the adap-tation of weaving machinery to short-fiber wool, a market has developed in the United States that has proved of great help to the sheep men of South Africa. During the present season American buyers have been heavy pur-chasers of fair to good grade wools; such purchases will probably aggre-gate \$5,000,000.

Agricultural News Notes

of the Pacific Coast

Northern California

Bartlett pear shipments are increasing in volume daily.

The State Fruit Growers' convention will meet at Palo Alto July 27 to 30.

According to latest registration reports Nevada County has 223 automobiles.

Mr. Marsh at Santa Rosa is finding fine results from Imperial prunes planted in dynamited holes.

Three salmon canneries are now operating at Requa on the Klamath River in Del Norte County.

The dry milk plant of the Central Creamery Company in North Ferndale, Humboldt County, suffered a \$25,000 loss by fire recently.

More than 200 Rambouillet sheep were lost by one sheep owner at Woodland, Yolo County, through some unknown infectious disease.

Thirty-seven rice growers of rich-valley district of Butte County have been enjoined from draining their lands in such a manner as to overflow or seep onto lands of neighbors.

Government buyers of mules for use in the Philippines have been active in the vicinity of Arbuckle for several days, about 100 head already being purchased.

Big preparations are making for the sixth Gravenstein apple show at Sebastopol, August 14-22. J. P. Kelly of Sebastopol is secretary of the show association.

Sixty-eight per cent of normal is the estimated apple crop for Northern California with the exception of Glenn, Yuba and Sacramento Counties, which are estimated at 100.

More than \$500,000, it is estimated, will be saved to California shippers of dried fruits by the reduction in freight rates authorized June 24 by the interstate commerce commission.

The International Viticultural Congress met on the exposition grounds at San Francisco July 12-13. Many vineyardists were present from other states of the Union and from several foreign countries.

Governor Boyle of Nevada has issued a quarantine proclamation forbidding importation of bees from California unless examined for American and European foul brood and passed upon by inspectors.

The cow testing association, with headquarters at Gridley, covers a territory including Butte, Yuba and Sutter Counties. Ten of the cows tested showed over 50 pounds butter fat during the month of June.

Farm Adviser Frank F. Lyons of San Joaquin County last week addressed members of the North San Joaquin chamber of commerce at Lodi on grape mildew, using for the first time a new stereopticon outfit to illustrate his talk.

At the recent meeting of the Woodland unit of the Yolo County farm bureau a letter was presented from Humboldt farmers asking as to the possibility of Woodland alfalfa growers supplying them with hay. A committee was appointed to make a thorough investigation of best routes for shipping and rates.

Central California

Rochdale stores of Stanislaus County have failed.

The planting season for citrus trees in Tulare County is practically ended.

The California Cured Fruit Exchange now has 25 local associations over the state.

Beans grown in young lemon orchards have been demonstrated to be very profitable in Porterville.

The opening top prices for wheat from Tulare Lake lands this season is five cents higher than last year.

San Francisco sheep buyers in the San Joaquin Valley say that sheep are in especially fine condition this year.

The Cooperative Poultry Association at Visalia is planning to put on an auto delivery to handle the local trade.

The Porterville Citrus Association is planning additions and improvements to its packing plant to the tune of \$9000.

The Fresno Raisin and Fruit Products Company will handle Kings County peaches this year. It will dry Elbertas, Muirs and Lovells.

Manager James Madison of the Associated Raisin Company, is urging grape growers not to spoil the raisin market by drying wine grapes.

The Northern California Citrus Growers is the name of the recently formed organization in Tulare County. Fifteen hundred acres are now represented by the membership.

Pajaro Valley apple growers have organized an association to perfect the packing, shipping and marketing of their fruit. It will be known as the Watsonville Fruit Distributors.

Merced sent out its first carload of green tomatoes to the Seattle market the last week of June. Several carloads of onions were also shipped to Northwestern markets the same week.

What will be one of the finest dairies in Central California is being developed west of Porterville by Sampson and Denny, who have invested \$50,000 in alfalfa land and are constructing buildings at a cost of \$100,000.

Programs for the sessions of the International Irrigation Congress in Fresno, Stockton and Sacramento, in September, have been drafted by the California board of control. The congress will meet in Fresno September 15, 16.

Kings County has enacted a drastic ordinance for control of hog cholera. It provides that ranches where cholera exists must have signs posted informing the public of the fact, also ranches where hogs have been vaccinated with hog cholera virus must post signs.

Reduction in carload freight rates on dried fruits from California to all points east of Colorado was announced on July 1st by the Southern Pacific. The reduction amounts to 20 cents per 100 pounds, and was made to compete with water rates through the Panama.

The Tulare County Growers' Association, with a canning plant at Porterville, announces ample fruit signed up for the season's work. It is also announced that half the output for the year has already been sold. Only the two fancy grades of fruit will be put up owing to the large crop.

Southern California

Orange County expects to have a walnut crop 25 per cent above normal.

A shipment of 750 bales of cotton was made last week from Calexico to New Orleans.

Twenty-nine cars of Valencia oranges were shipped out of the Ojai Valley of Ventura during the month of June.

Deciduous fruit growers of Hemet and San Jacinto are urging the establishment of a cooperative cannery at Hemet.

Governor Johnson has signed the pure milk bill by which \$10,000 is appropriated to establish a bureau of dairy inspection.

The output of the Ventura County Cured Fruit Association this season is estimated at 700 tons. Last year's output was 1000 tons.

The Villa Park Orchards Association of Orange County has just paid out to orange growers a total of \$44,000, this being the returns for the May pool.

The Pomona Valley Poultry Breeders' Association held a picnic Friday, July 2, at Ganesha Park. Membership in the association is open to all Pomona valley poultry growers.

The Beaumont Fruit Growers' Association has levied on all members an assessment of 50 cents per acre on bearing orchard and five per cent on net proceeds of sales made through the organization.

Farm Adviser Parker of Ventura County has established a demonstration plot in the apricot orchard of George Weddenhofer on Ventura Avenue, where he will treat with ammonium sulphate trees affected with little leaf.

Corona has been chosen as the location for the by-products plant of the California Fruit Growers' Exchange. The plant has been capitalized at \$100,000, subscribed by lemon growers affiliated with the fruit growers exchange.

The Lima Bean Growers' Association has suspended business for one year. This is pursuant to the decision announced by the directors some time ago that unless 50,000 acres was signed up by July 1 the association would discontinue.

The Yorba Linda Citrus Association has petitioned for an order dissolving its incorporation. The association has found that it needs a capital stock corporation to properly conduct its work. The members expect to reincorporate with a capital stock of \$75,000.

The bureau of chemistry has decided that the word "lima" may be used only for beans of the species *phaseolus lunatus*. Beans of other species have recently been imported under the name of lima, qualified by such terms as Manchurian, Korean and Japanese.

Ventura apricot camps are overcrowded with women and children seeking work. It is stated that Los Angeles employment agencies are posting bulletins that more people are wanted in the orchards and the Ventura people are sending requests that no more help be sent to them.

The Coast

Portland reports some sales of new crop hops at 14 cents.

Many contracts have been made for hops on the Oregon market at 12 cents.

There has been a slight decline in all live stock prices in Northwestern markets.

The July meeting of the Arizona State Poultry Association will be held July 20.

Lewiston, Idaho, expects to harvest its wheat crop at least two weeks earlier than usual.

The Lewiston district of Idaho shipped 55 cars of Bing and Royal Ann cherries for the season.

Tomato growers of Eastern Texas have suffered heavily from blossom rot and devastation by worms.

The grain harvest in Whitman County, Washington, is already started. The prospects are for a big crop.

Skagit County, Washington, reports the driest weather for many years and stock feed getting very short.

Roswell, New Mexico, reports 4,000,000 pounds of wool stored to date. This is nearly 1,000,000 pounds above previous records.

It is reported that the Norwegian government has just purchased a million and a quarter bushels of wheat in Northwestern ports.

The Angora goat industry of New Mexico is said to be in a more flourishing condition than ever. Growers confidently expect mohair to reach \$1.00 a pound.

The weeds have it their own way in Okanogan County, Washington, this past season as the rains have been so continuous the farmers have had no chance to cultivate.

Tidelands of Pacific County, Washington, are being used more extensively than ever for pasturage. A project is being considered for diking one of the rivers to extend pasture land.

Arizona has 1,761,000 sheep, most of them the so-called native stock. Many additional prizes will be offered for sheep at the state fair this year. A distinct effort is being made to encourage introduction of better breeding stock.

Actual construction has begun on the government's Alaskan railroad. The engineering commission has established its base of operations on Ship Creek, Cook's Inlet, and is building wagon roads and landing materials and supplies.

Leland S. Parke, state club agent of Arizona, in charge of boys' and girls' club work, has been holding a number of canning demonstrations throughout the Salt River Valley. Anyone interested in the work may address Mr. Parke at the University of Arizona, Tucson.

Cantaloupe growers of the Salt River Valley have been observing with much interest the work of the office of markets of the United States department of agriculture in the Imperial Valley of California and the Phoenix chamber of commerce has written to the department at Washington asking for assistance for Arizona cantaloupe men.

ALL OUR SILOS, TANKS AND PIPE ARE DESIGNED BY ENGINEERS TO MEET EVERY CONDITION. MADE IN OUR BIG FACTORY FROM CLEAR, AIR DRIED REDWOOD. SELECTED FROM A STOCK OF 40 MILLION FEET WHICH WE CARRY AT ALL TIMES.

SILOS

BUILT FOR YOUR PARTICULAR NEEDS. EXACTLY AS YOU WANT THEM. ALL SIZES AND DIMENSIONS

15x36 REDWOOD STAVE SILO MANUFACTURED BY US FOR THE PANAMA-PACIFIC INTER — NATIONAL EXPOSITION, SAN FRANCISCO, 1915

TANKS

BUILT TO ORDER, TO SUIT ALL USES AND USERS. CHEAPER THAN METAL TANKS. LAST LONGER. WON'T RUST. CAN BE TAKEN DOWN AND RE-ERECTED WITHOUT DAMAGE. CAPACITIES, 500 TO 500,000 GALLONS. TOWERS INCLUDED IF YOU WANT THEM.

PIPE

MACHINE BANDED OR CONTINUOUS STAVE — FOR WATER SUPPLY — IRRIGATION OR POWER. CHEAPER THAN ANY OTHER PIPE OF EQUAL SIZE OR CAPACITY. LONGER LIVED THAN ANY METAL PIPE EXCEPT CAST IRON.

REDWOOD MANUFACTURERS CO.

1604 Hobart Building, San Francisco

Live Stock and Dairy

GRAIN FEEDS WITH OAT HAY FOR DAIRY COWS

A RANCHER at Monterey writes that he has a large crop of red oat hay which he values at \$8.00 per ton loose, which he wishes to use for roughage for dairy cows in a ration with dried beet pulp and asks what our suggestion would be for a ration composed of red oat hay at \$8.00 per ton, dried beet pulp at about \$23.50, and for a suitable concentrate to balance the ration so as to make it unnecessary to feed alfalfa, which would cost \$10.50 per ton.

This is answered by Prof. F. W. Woll, University Farm, Davis, as follows:

Both oat hay and beet pulp are relatively low in protein substances which are very important components of rations for milk-producing as well as for growing animals. Alfalfa hay on the other hand is higher in protein, or muscle-forming substances, as they are often called. This is shown by the nutritive ratios of the different feeds, by which term we understand the proportion of digestible protein to digestible carbohydrates and fat. The nutritive ratio of oat hay is about 1:8.6 (meaning that there are 8.6 pounds of starchy components, i. e., carbohydrates and fat, for every pound of digestible protein); that of beet pulp 1:15.8; and of alfalfa 1:4.0. Since the rancher does not wish to feed alfalfa hay, one or more of a high-protein concentrate must be supplied, and we then have the choice between wheat bran, middlings, cottonseed meal, linseed meal and coconut meal. The nutritive ratios of these feeds are as follows: Wheat bran 1:1.6, coconut meal 1:3.9.

Since all these concentrates are palatable dairy feeds the choice must be decided largely by their cost. Last week these feeds sold in Los Angeles as follows: wheat bran, \$1.90 per cwt.; middlings, \$2.20; cottonseed meal, \$1.80; linseed meal, \$2.60. Under the conditions stated when a good supply of protein is important, it is evident that the cottonseed meal is by far the cheapest feed that the rancher can buy and feed his cows along with oat hay and beet pulp, while the prices of oil meal, wheat bran and middlings are about prohibitive in this case. I do not have the market prices of coconut meal but it probably does not differ greatly from that of dried beet pulp. Both of these concentrates are excellent feeds for dairy cows and as a rule are relatively cheap. If coconut meal can be had it may enter into the grain ration with the dried beet pulp and cottonseed meal, say in the proportions of two pounds of dried beet pulp to one each of the other feeds, by weight, feeding one pound of this mixture for every five pounds of milk produced by the cows. For a good dairy cow, yielding say three gallons of milk per day, the ration would then be: Oat hay, ad lib. (20 to 25 pounds); beet pulp 2½ pounds; cottonseed meal and coconut meal 1¼ pounds each. This ration would supply the following nutrients in case of feeds of average composition and digestibility: 27.3 pounds dry matter, 1.84 pounds digestible protein and 13.0 pounds digestible carbohydrates and fats (nutritive ratio, 1:7.1.)

This is perhaps the cheapest ration that can be fed under the conditions stated. It is very likely, however, that the production of the cows would be somewhat increased by feeding more protein either in the form of more cottonseed meal or by giving a feed of alfalfa hay once a day. The difference in the price of the two kinds of hay is small compared with the difference in the cost of the starchy and high protein concentrates, as will be readily seen from the figures given above.

The ration suggested can only be recommended where more protein can not very well be supplied either in the roughage or in the grain ration. A good dairy cow ought to have at

least two pounds of digestible protein a day and the ration should contain about a pound of digestible protein for every six pounds of digestible carbohydrates and fat (nutritive ratio, 1:6 or less). The cheapest way of supplying the protein in this case would be to feed both alfalfa and oat hay, either equal parts or one-half as much alfalfa as oat hay, feeding the same grain ration as suggested above.

Guy H. Miller of Modesto writes:

"Your correspondent says he has oat hay worth \$8 a ton which he wishes to feed with dried beet pulp at \$23 per ton, and that alfalfa hay is worth \$10.50 per ton.

"I would not consider oat hay and dried beet pulp a suitable ration for dairy cows. About the only value dried beet pulp would have in that kind of a combination would be that by soaking it, which is the common practice, it would add a certain amount of succulence to the ration. Dried beet pulp and oat hay are both rich in carbohydrates and are deficient in protein. Protein is a necessary ingredient in a ration for dairy cows. Alfalfa hay is rich in protein and is generally of moderate price compared with other protein feeds. That is why it is the greatest single dairy feed yet discovered. If I had to feed oat hay I think I should feed with it wheat bran and coconut meal to obtain a greater amount of protein. Bran is very similar in analysis to alfalfa hay. They each contain about 11 per cent digestible protein and 41 per cent carbohydrates. Bran is a little richer in fat, containing about 2 per cent. Coconut meal contains about 15 per cent protein and 9 per cent fat and can be bought for \$28 per ton. I would consider it a good feed to use with oat hay, but do not think it could be fed alone. It would be eaten better fed with something as a carrier, such as wheat bran.

"I would suggest that the inquirer sell part of his oat hay and buy some alfalfa hay at \$10.50, feeding a feed of oat hay in the morning and a feed of alfalfa at night. If a cow consumes 30 pounds of this mixture daily it would make an approximate ration of 2.28 pounds digestible protein, 12.7 pounds digestible carbohydrates, .4 pounds fat, which would make a very fair ration for a cow milking 20 pounds per day. Cows milking heavier should have some concentrates such as wheat bran and coconut meal with a little dried beet pulp or crushed barley.

If I could get nothing but oat hay in the way of hay to feed I should try feeding 25 to 30 pounds daily per cow with two pounds of coconut meal and four or five pounds of wheat bran. If the cows seemed to relish the coconut meal I would try feeding a little less bran with it, possibly increase the coconut meal a little. In the case of fresh cows giving a heavy flow of milk it might be found necessary to increase both coconut meal and bran.

"Dried beet pulp is a feed that is increasing in popularity in Stanislaus County because Stanislaus County is a heavy alfalfa producing section, and the beet pulp, fairly rich in carbohydrates, is proving an excellent feed with alfalfa hay.

"If the inquirer has a silo or concentrates erecting one, I would suggest to him that he try oats and vetch or barley and vetch for silage; the vetch furnishing a large amount of protein should make a good combination with barley or oats and would save feeding so much high priced concentrates to secure a desired amount of protein. Some dairymen here are finding the barley and vetch combination excellent as a winter crop for silage."

"What is your name?" a Kentuckian asked a negro boy. "Well, boss," he answered, "everywhere I goes they give me a new name, but my maiden name was Moses."—Everybody's.

"Fills Silos as Fast as Eight Teams Can Haul It To Machine"

This satisfaction of a California dairyman is repeated every season by enthusiastic owners on the Pacific Coast

CLIMAX SILAGE CUTTER

That Famous Inward Shear Saves Power.

The steel knives, finely tempered, and bolted to heavy knife wheel are easily removed for grinding. Their greatest value lies in the fact that they cut from the outer edges toward the center where cutting power is greatest. Other wheel type machines cut the other way.

These Features All Tend to Save Power.

The Inward Shear explained above, the staggered tooth feed rolls make fast feeding possible. Heavy knife wheel, with fans behind each knife, lifts and blows the silage away without clogging. Closed elbow is a great convenience.

It will do maximum amount of work on minimum power.

Write today for FREE catalog and full particulars.

Ask any Climax owner about the durability and economy.

SMALL GRANS AND ALFALFA FOR HOGS

The growing of swine and the production of pork are industries that today are claiming increasing attention. Experiments with grain, which may take the place of corn for feeding purposes, are of the greatest interest to farmers in this region, because the small grains are often grown in abundance and form the basis of all rations. A great amount of wheat, barley, and rye is fed in the form of mill products, and is of course ground. In common practice also these grains are ground more generally than corn, as they are generally much harder. The greater liability of these small grains to pass through the animal undigested shows the correctness of such a practice.

Best Results with Wheat

Chief among the small grains is wheat, and it appears to be the food best adapted for long-continued hog feeding. The advisability of feeding wheat or any other grain, however, depends upon market prices and economic conditions. It could hardly be regarded as economical to use wheat as stock feed at the high prices now

not saving in the right direction. So many of us are "penny wise and pound foolish."

Save the Whole Corn Plant

Every year millions of acres of corn fodder goes to waste in the corn belt. The ears are husked and stalks left in the field to go to waste. If put in the silo they would have made valuable feed. The great central truth and principle with this silo is that it is a system whereby the whole corn plant may be preserved and made into milk and meat without waste. But the first cost of the silo and machinery has driven the cost of the waste clear out of many farmers' heads. They see the first cost but don't see the dollar's worth of wasted fodder, wasted labor to grow it and wasted opportunity to make a profit on it. This, however, is only one of a thousand ways in which time, money, and effort is wasted on the farm.

Test Out the Unprofitable Cows

Think of the years of hard work the farmers have spent in caring for and feeding the poorly bred cows that will not return a profit. Changing your methods in this direction is simply one

VALUE OF BARLEY FOR COWS

"The Value of Barley for Cows Fed Alfalfa" is the title of Bulletin No. 256 of the University of California agricultural experiment station, by Gordon H. True, F. W. Woll and E. C. Voorhies. Various tables and illustrations make the work very valuable. We quote in full the conclusion:

"The results of the two experiments with feeding barley to cows on alfalfa reported in this bulletin show that an immediate increase in production will be secured as a result of the grain feeding, but that this increase will not, as a rule, pay for the extra cost of the ration. On account of the increased production obtained and the residual effect of the grain feeding, as well as its favorable influence on the condition of the cows and their offspring, it may be concluded, however, that the practice of feeding grain to cows on alfalfa is economically sound and may be recommended. This holds true especially for heifers and young cows, as well as for heavy producing animals which cannot be brought to a maximum production on roughage only, even if this be as excellent and palatable a feed as green alfalfa or good alfalfa hay."

TO AVOID BLOAT IN CATTLE

Rank grass and wet green clover or alfalfa are likely to cause bloat in cattle. Bloat may be avoided if right precautions are taken, says Dr. A. S. Alexander of the college of agriculture, of the University of Wisconsin. Here are a few of them:

Gradually change cows from hay rations to fresh pastures.

Prevent indigestion, because indigestion is the direct cause of bloat.

Feed cows their usual ration of dry hay and grain before turning them out to pasture.

Keep cows off alfalfa fields until dew or rain has dried off, and never turn them on such fields on moisture-laden, "muggy" days.

Give cattle access to a mixture of salt and slaked lime.

Visit pastures frequently in early summer and if possible take along proper remedies and instruments for relieving bad cases of bloat.

BREEDING HORSES IMPORTED

The bureau of animal industry has issued a list of horses imported for breeding purposes during 1914. In the list are 524 Percherons, 391 Belgians, 68 Shires, 51 Clydesdales, 60 Welsh ponies, 22 Hackneys, 24 Shetlands, 30 Suffolks and 35 Thoroughbreds. We do not believe we would have to go back very many years to find the Thoroughbreds topping the list. It shows a material increase in the demand for utility and a decrease in the demand for the racing man's horse.

AYRESHIRE BREEDERS

The Ayreshire Breeders' Association is awaking to the fact that it has a breed of cattle whose merits are well worth being made known. One step in this direction is the issuing of the Ayreshire Quarterly, published by the association from its office at Brandon, Vermont. General information regarding the work of the association may be had by writing Mr. C. M. Winslow, Secretary, Brandon, Vermont.

VACCINATING AGAINST HOG CHOLERA

Circular 132, issued by the veterinary division of the college of agriculture, University of California, is entitled "When to Vaccinate Against Hog Cholera." It is only a four-page circular but should prove very valuable to the hog breeder. One feature of the circular is information regarding the sale at actual cost of anti-hog cholera serum to breeders.

Many thrifty people are now saving up money for vacation by adjourning payment of the grocer's bill until fall.

It is generally the things we have not got that make life worth living.

Producers of Monthly Pay Checks

prevailing. A bushel of wheat properly fed to reasonably well-fed hogs should produce approximately 13 pounds of gain in weight. The results of a number of feeding tests show that there is comparatively little difference in feeding value between wheat and corn for swine.

In comparing various rations in which corn, wheat and rye were fed alone or in combination with each other, it was found that dry, ground wheat gave the greatest returns and required the least amount of grain to make 100 pounds of gain. Wheat should be ground and mixed with some supplement, such as tankage, peas, or soy bean meal. The results obtained from a number of tests have proved this to be a good practice.

Barley Produces Best Pork

In Great Britain and northern Europe barley takes the place of corn for pork production, leading all grains in producing pork of fine quality, both as to hardness and flavor. Considerable study in the United States has been made of the value of barley as pig feed, and the results have shown that it compares very favorably with corn, but has a feeding value somewhat below that of wheat. What this grain may lack in feeding value, however, is more than supplied in its effect on the carcass. As a high grade pig feed it far surpasses any other grain, and this fact makes possible the production of pork of the first quality in regions where barley is produced abundantly. Ground or rolled barley is best fed in combination with wheat middlings, skim-milk, roots, alfalfa, etc.

ECONOMY OF PRODUCTION

Every dairyman that is not making money is allowing some big waste to go on. Probably he will tell you he is as saving as he can be, but he is

way of stopping another waste. By the investment of a few dollars in milk scales and tester and a little time to keep records in, many a farmer has eliminated a waste in his dairy and "started the ball a rolling" towards larger production at a lower cost per unit. But still many farmers can't see this waste any more than in the case of the corn and silo.

When we get right down to the bottom of this subject of dairying we find that it is economy of production that we should worry about more than the price obtained.

We must produce with the highest efficiency and lowest cost. Right here is where the silo comes in, the better bred cow, the modern and sanitary dairy barn, better feeding and better farm management in general.

Business Management

Good management even affects the hired man. We find as a rule that the man who has put dairying on a business basis gives his men shorter hours with better pay than the man who is still getting it in a backward way. One who handles help this way makes labor profitable. As a result he has no trouble getting efficient labor.

If the farmer is going to make a profit on his investment he must learn the great lesson of business; let nothing go to waste, spend money liberally if necessary to prevent leaks. We can learn a lesson from the large business organizations in this respect. We must bring our soil, animals, buildings, machinery and labor to their highest efficiency as soon as possible. If we have faith in this principle and follow it wisely it will surely bring us profit and more pleasure in our farm work.—Farm, Stock and Home.

Opportunity knocks now and then for the most people, but it seldom bursts down the door.

HOT WEATHER

the season a

DE LAVAL SEPARATOR

saves most over
any other separator
or skimming system

IT'S A GREAT MISTAKE FOR any dairy farmer without a separator or using an inferior machine to put off the purchase of a De Laval Cream Separator in the summer months.

GREAT AS ARE THE ADVANTAGES of the De Laval over all other separators, as well as over any gravity setting system, at every season of the year, they are even greater during the mid-summer season than at any other time.

THIS IS BECAUSE HOT WEATHER conditions occasion greatest butter-fat losses with gravity setting and render it most difficult to maintain quality of product with any gravity system or unsanitary separator, while, moreover, the quantity of milk is usually greatest, and any loss in either quantity or quality of product means more.

THEN THERE IS THE GREAT saving in time and labor with the simple, easy running, easily

cleaned, large capacity De Laval machines over all other methods or separators, which naturally counts for most at this time of the year.

HENCE THE GREAT MISTAKE

of putting off the purchase of a De Laval Cream Separator in summer, whether you already have a poor machine or none at all, and every dairy farmer should keep in mind not only that a De Laval will pay for itself by next spring, but may, if desired, be bought on such liberal terms as to actually save its own cost while being paid for.

EVERY CLAIM THUS MADE IS subject to easy demonstration, and every De Laval local agent is glad of the opportunity to prove these claims to you, in your own dairy, without cost or obligation on your part.

IF YOU DON'T KNOW THE nearest De Laval agent, please simply write the nearest main office as below.

Veterinary Queries

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Paralysis After Milk Fever

Veterinarian treated cow for milk fever by pumping air into udder and gave hypodermic of strychnine and something to open the bowels. After two days she is still on her side. She eats a little and drinks and does not seem very sick. Has no fever. Can turn over but not stand.

Your veterinarian did all right for the milk fever but he should have applied liniment to the loins and warmed it in with a hot blanket. Enemas should also have been given and the cow turned from side to side frequently. When the cow is once on her feet again and the bowels started freely she will probably get along all right.

Cows Not Breeding

Have a few cows that will not receive bull. They are on pasture and in good condition.—Subscriber, Smith River.

You can do very little except to let nature take its course.

Might suggest that you place salt where they have free access to it. A little sulphate of iron mixed with the salt might help some.

Collar Tumor

I have a horse that has a large caloused lump on the point of the shoulder. It is raw on the surface and has a center that discharges a little. Is there anything I can do to cure it?—Subscriber, Ontario.

Those hard lumps are caused by the continued pressure of an ill-fitting collar. First, use a close-fitting collar and adjust the hames so the tug will draw from a point higher up. Apply the following liniment to the lump once a day: Mercury bichloride one dram, alcohol one ounce and enough turpentine to make one pint.

Cure for Sweeny

Through the kindness of Mr. George Wineman of Santa Maria we have the following letter: "For the benefit of the subscriber at Bloomington whose mule has sweeny, I am sending the following formula. It was given to my father more than 25 years ago. In all that time I have never known it to fail to cure a case of sweeny. It is to be applied each morning with the hand to the affected muscle and should be used for five successive days, but it is so strong that three applications is all that the horse will usually stand. We apply the remedy and continue to work our horses. In from two to six months the muscle grows out and the animal is as well as ever." The formula follows:

One ounce of each of the following ingredients: Oil of spike, spirits of turpentine, aqua ammonia, oil organum, sweet oil and alcohol.

Contagious Conjunctivitis

Several of my cattle on range have recently developed eye trouble. I am satisfied that foxtail isn't the cause. The left eye is usually attacked first, a thin watery fluid is discharged, caking as it dries. Shortly after the right eye is affected, and as the trouble develops a cloudy film spreads over the eyeball, the edges of the eyeball become bloodshot, the lids are more or less inflamed and the animal is almost totally blind. If a disease, what is the cause? Is it infectious or contagious like glanders? Can a human being become affected? How is it spread and what is the best treatment?—Subscriber, San Dimas.

The front of the eye is covered with a thin skin or membrane that is called the conjunctiva. It is very thin and perfectly transparent. Inflammation of this membrane causes it to become

thickened and turn white. The disease is called conjunctivitis. The trouble may be caused by an injury or by microbes. Its occurring in several animals leads one to believe it is due to microbes. It is contagious with animals but does not affect the eyes of people. The following treatment usually restores the sight in a short time. Sponge the eye well with warm water and then dry it by pressing a clean towel against it. This can be done with the eye closed.

Then press the lids apart with the fingers and apply with a camel's hair brush to the membrane a solution made of ten grains of nitrate of silver to the ounce of water. Repeat this once a day until the eye is partly cleared. The animal should be kept in the dark as the light causes pain and retards recovery. Or if it is necessary to turn them out for feed, tie a thick cloth to the horns or halter so it will cover the affected eyes and keep the light out.

Maricopa County, Arizona, Jas. A. Armstrong, Agent, Phoenix

Maricopa County interests are coming together. Forty business men met last Thursday and decided to appoint a committee to draw up plans for a county organization of existing organizations to be composed of one delegate from each district, these delegates to form an advisory council on agricultural subjects to work with the farm adviser for the increasing of farm profits in the county. The following committee meets today, July 15: W. E. Walker, Roosevelt District; C. C. Green, Glendale; F. E. Jack, Alhambra; P. Aepli, Tempe; H. Clay Parker, Roosevelt; J. C. Norton, Phoenix; W. Peterson, Arlington; Elijah Allen, Mesa; J. O. Barnard, Laveen; R. Huckler, Washington; A. W. Ayers, Gilbert; Geo. Brown, Buckeye; S. C. Sorrensen, Lehi; Secretary Parkhurst, Chandler.

Favorable reports are being received daily from ranchers fighting harvester ants. The following are a few: F. A. Van Meter, Mesa, says, "We have to do it or move out." Geo. Peterson, Mesa, "About half the nests first treated had to be retreated." R. M. George, Scottsdale, "I doped them twice last fall and once this spring, ants almost gone." Harry L. Shedd, Phoenix, "Used London Purple last year and have no sign of ants this year."

Red spiders are showing up since the hot weather began. If your trees look dusty and the leaves drop off, examine them closely and if very small yellow spiders, about the size of a pin point are seen, then dust your trees with dry sulphur. This like other troubles is easier prevented than cured.

Lettuce growers have asked that the university send a man to help them during the coming season. S. B. Johnson, a vegetable specialist, will be over to first study the situation and make recommendations. He and Farm

Adviser Armstrong will work with the lettuce growers.

Sheep on the ditch bank will be discussed by Prof. A. M. McOmie at Chandler July 24. This is an open meeting of the Farmers Union. Prof. J. J. Thornber has also promised to be present but has not announced the subject of his talk.

Manager McNab and the farm adviser will meet with the Higley Board of Trade on July 23. Mr. McNab thinks that the Higley district is an ideal place for the breeding of pure seeds.

TO PREVENT FOREST FIRES

To obtain the cooperation of the public in preventing forest fires, which are doing a great deal of damage in the East this spring, the United States forest service has prepared ten "Don't's" to be observed in the woods.

DON'T'S

1. Don't throw your match away until you are sure it is out.
2. Don't drop cigarette or cigar butts until the glow is extinguished.
3. Don't knock out your pipe ashes while hot, or where they will fall into dry leaves or other inflammable material.
4. Don't build a camp fire any larger than is absolutely necessary.
5. Don't build a fire against a tree, a log, or a stump, or anywhere but on bare soil.
6. Don't leave a fire until you are sure it is out; if necessary smother it with earth or water.
7. Don't burn brush or refuse in or near the woods if there is any chance that the fire may spread beyond your control or that the wind may carry sparks where they would start a new fire.
8. Don't be any more careless with fire in the woods than you are with fire in your own home.
9. Don't be idle when you discover a fire in the woods; if you can't put it out yourself, get help. Where a forest guard, ranger, or state fire warden can be reached, call him up on the nearest telephone you can find.
10. Don't forget that human thoughtlessness and negligence are the causes of more than half of the forest fires in this country and that the smallest spark may start a conflagration that will result in loss of life and destruction of timber and young growth valuable not only for lumber but for their influence in helping to prevent flood, erosion, and drought.

Many thousands of acres of forest and suburban woodland from Maine to Florida, and from the Atlantic coast as far west as Arkansas, have been burned over already this spring by fires which started for the most part from preventable causes. On the national forest purchase areas alone, 49 fires occurred in March, burning over more than 6500 acres, while 44 fires starting on private land near or within government boundaries damaged nearly 5500 acres. Fires in April were even more numerous and severe, but rains in the latter part of the month helped the situation somewhat. Fire statistics for April are not yet available.

Poultry for Profit

FINISHING FOR MARKET

Written for the California Cultivator
By Jean A. Koethen

THE finishing of poultry for market is an art in itself. Anyone can raise chickens; almost anyone can fatten them, for this requires only confinement and plenty of corn; but the proper finishing of poultry so that the fat is evenly distributed over the carcass is a delicate matter and understood by only a few Americans. A bird that is sent to market should not only weigh as much as it can be made to weigh at that age, but it should be so plump and well filled out in every part that it will look as good as it tastes.

We Americans have little to boast of when it comes to preparing chickens for market. Whatever our progress may have been in other ways and however the poultry industry may have grown—and it certainly has—we have not advanced an inch in 2000 years in our preparation of fowls for the table. Indeed, it is a question whether those old Roman epicures did not have better table poultry than ours.

The methods of coop-fattening followed in most big finishing plants in this country today is very similar to that of the Romans. The birds are confined in small cages, five or six in each, with barely room to turn, and are fed a mixture of ground grains, usually containing oats, wheat, corn, barley, and sometimes oil meal. The mixture is moistened with skim or sour milk when possible and fed in troughs on the outside of the coops. The feeding is done three times a day, and it takes from 20 to 25 days to finish a fowl. In these plants the coops are arranged in tiers five or six high. They have solid bottoms with slatted bottoms above so arranged that the droppings may fall through the slatted bottom to the solid bottom and be removed without disturbing the birds. In some plants it is not considered necessary to remove the droppings till the finishing is completed.

Machine cramming, which has been practiced in France and England for many years, is gradually being taken up in this country. It seems a brutal method akin to the forced feeding of human beings but brings the birds to a perfect finish more quickly and is probably no more brutal than other treatment which fowls receive. It has developed from the use of a funnel as practiced at Maris, France, in the last century. Here the birds after being placed in rows of pens in a warm place were crammed three times a day with barley meal, wheat, millet and maize, soaked in milk and fed through the funnel in a rather liquid state. With the help of the funnel a man could cram 50 fowls in an hour.

Buckwheat, low grade flour, shorts, barley meal, ground oats and corn meal are the best fattening feeds, but they are much more effective when

mixed with sour milk. A recent government bulletin on "The Commercial Fattening of Poultry" gives three rations which have been found satisfactory:

No. 1 consists of three parts corn meal, two parts low grade flour, one part shorts.

No. 2—Three parts corn meal, two parts low grade flour.

No. 3—Five parts corn meal, three parts low grade flour, one part shorts, five per cent tallow.

All but the last are mixed with thick buttermilk.

At Purdue University, where special attention has been paid to the production of market poultry, the ration consists of: Two pounds corn meal, one pound shorts, one pound ground oats, eight pounds buttermilk.

Professor Dryden of Oregon agricultural college recommends a ration consisting of equal parts ground oats, ground barley and middlings, with a little bran, and all moistened with buttermilk.

The English have long been adepts in the art of finishing poultry. In the early part of the nineteenth century a Sussex man was quite famous for his fattening of chickens which "reached a size and perfection not known elsewhere. The food given them was ground oats made into gruel, mixed with hogs' lard or grease, sugar, pot liquor and milk; or ground oats, treacle, and suet, also sheep's pluck, etc. They were kept very warm and always crammed in the morning and at night. The pot liquor was mixed with a few handfuls of oatmeal, then boiled up, taken off the fire and the meal therewith made into paste and divided into rolls for cramming. The fowls were put into the coops a few days previous to cramming, the process being completed in a fortnight. Fowls thus fattened would weigh about seven pounds and average five pounds, though some arrived at double that weight."

These interesting facts regarding fattening of poultry in earlier times are given by Miller Purvis in an article in Harrison Weir's "Poultry Book." Mr. Purvis says that his father had a couple of pullets from a farmer in Cuckfield, England, in 1834, which weighed over 21 pounds, the food used being two parts oatmeal to one part barley meal mixed with milk, with some suet and a little sugar added. Mr. Purvis concludes:

"It has been generally supposed that the more nutritious the food given the better the fowl, but experiments have proved that this is by no means always the case. For instance buckwheat and oatmeal mixed have not been found so serviceable as when one-third of boiled potatoes have been added. Again ground corn is better with one-third boiled unhusked rice. Ground oats, with one part potatoes or some boiled cabbage, are good; wheat and rice boiled together are good, as is also buckwheat and one-third potatoes, with a finish of all buckwheat. The old finishers never gave hard grain, but if whole, soaked it at least 12 hours or boiled it. In all cases it was usual to add some gravel or very sharp sand. Sometimes table beer was used in the latter part of the day for moistening the food and skim milk in the morning, but not generally. The giving of sugar was thought to make the birds so thirsty that they would eat more of the mixed food for the sake of the moisture."

LEG WEAKNESS IN CHICKS

When a poultryman goes out in the morning to find his biggest framed, most rapid growing chick wobbling around on unsteady legs, and by night walking upon his hock joints, or refusing to walk at all, he wishes to know what causes leg-weakness and why it affects his most rapidly growing chick, if any. For his benefit Helen Dow Whitaker of the poultry department of Washington state college explains that leg-weakness is found more

often among brooder reared than among hen reared chicks. One condition favoring it is a bottom-heated hover. The floor of the hover should be slightly warm, about 60 degrees, but should never feel hot to the hand. The chick that sleeps stretched out upon a hot floor is weakened thereby. Nature seems to insist that a chick should have heat radiated from above down over his back, and teaches him to stick his head out from under his mother or the edge of the hover to keep it cool and get fresh air.

Other conditions favoring leg-weakness are over-crowding, poor ventilation, dampness and whatever tends to lessen the vitality of the chick. Keeping chicks upon hard wooden or cement floors too much of the day is frequently cited as a cause of leg-weakness. It rarely affects chicks that from the start are able to be out on reasonably dry, loose earth in which they scratch incessantly, and where they find abundant tender, succulent green food. Unquestionably, if there be added to a lack of exercise and a lack of good green food, the overfeeding of a somewhat rich ration, leg-weakness is likely to result.

Chicks need, in abundance, nutrients for the building of bone and muscles. Their ability to get these is dependent upon the right food supplied them, appetite to induce them to eat largely, ability, not only to digest what they eat, but to assimilate the nourishment in it.

Lessen a chick's vitality by overheating, crowding, impure air and dampness, keep him upon a hard board floor that offers little inducement to exercise, overfeed him on rich food until his appetite is cloyed and his system clogged so that he cannot digest his food and it is not strange that his rapidly growing frame and muscles fail to get the supply of building material called for and break down in what we call leg-weakness.

The remedy is fresh air, sunshine, room for vigorous scratching in loose soil, a supply of food measured by the appetite, with plentiful green stuff and fresh water to aid in his digestion. Protein and ash are needed rather than fats. These are supplied by rolled oats for the first four weeks and later sprouted oats, by wheat bran, finely cut green clover or alfalfa, milk and granulated bone.

I wish especially to emphasize the value of a high grade of dry granulated bone. Its analysis shows over 20 per cent of protein for muscles and feathers, over 40 per cent of lime for bones and feathers, and over 20 per cent of phosphoric acid. The phosphates are more and more being recognized as valuable in animal nutrition and hence growth. Use at least one pound of granulated bone to every ten pounds of bran fed to growing chicks.

MITE CAUSE MIGHTY LOSSES

Are your fowls dumpish? Do they peck and scratch their plumage? Is the egg record dwindling?

If so there's a reason, and possibly it's lice or mites.

Eight or more distinct varieties of lice commonly affect the domestic fowl during the day time, and then at night they are "pestered" with "the bed bugs of the poultry world"—red mites. In addition to external discomfort, lice and mites are often the cause of serious losses.

Here are a few hints on the subject by the head of the poultry department at the University of Wisconsin:

"To find out if mites are present, pour some kerosene into the crevices of the roosts. Fumigate at once if the insects are present. Remove all loose boards and litter from the house and tightly close the doors and windows. This should be done early in the day and the fowls kept out after fumigation until the premises are well aired.

"Spraying with whitewash, kerosene, coal tar disinfectant, or crude carbolic acid is more satisfactory. One part crude carbolic acid with 15 parts of kerosene makes a splendid mite killer. Painting the roosts and nests with one of the commercial compounds takes a little longer but is more effective.

"In mite extermination the important thing is to reach every crack and crevice with the spray mixture. The next important point is to repeat the application at frequent intervals in order to kill any pests that may have hatched in the meantime."

Meet your Business Face to Face

The Cultivator Poultry Book Poultry for Profit

BY
Jean A. Koethen

Graduate of University of Calif.

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

Where is there a thoroughly successful business person, who did not first go over carefully all the ins and outs of his future business? The poultry business is your future business; meet it face to face with all its ups and downs explained thoroughly in the book "Poultry for Profit."

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on eggshell book, binding full cloth vellum de luxe, at the price of one dollar postpaid.

Order your copy NOW.
Equip yourself mentally FIRST.
Invest your capital LATER.

TREES

BEST ORCHARD HEATER KNOWN
CHEAPEST, GIVES BEST RESULTS,
AND BURNS LEAST OIL. ALL OTHERS
AWAY BEHIND. R. R. Snowden, Agent,
320 Stimson Building, Los Angeles, Calif.

Prices Reduced—Ganter and Harman
Avocados, 4 to 7 ft., extra fine field
grown trees with large, even heads; on
rented ground and must be sold. Our
prices will surprise you. Citrus also re-
duced. Magnolia Nursery, Whittier, Cal.
Wanted—Any orchardist with sick, stunted
or unproducing trees, to write to me for
advice about handling the condition. A.
M. Wells, 633 Van Nuys Building, Los An-
geles, Calif.

For Acacias, Avocados, Budded Loquats,
Citrus trees, Evergreens, Feijoas, Palms,
Roses and all kinds of trees, shrubs, vines,
etc. Write for our new catalogue. Robert-
son Nurseries, Fullerton, Cal.

For Sale—Eureka Walnut Trees, budded
on Native Black Walnuts. Choice stock.
Order immediately. Don't delay. Wm.
Holve, Fullerton, Cal.

Nurserymen—Pot grown conifers, palms,
shrubs and ferns for lining out or potting.
Ballou's Nursery, Pasadena, Cal.

Avocado Buds—Original Mesquite tree, Sig-
nal Hill, 10c each; \$3 hundred. Ralf
Goddard, R. 1, Box 339, Long Beach, Cal.

Citrus Nurseries, Murphy Oil Company,
East Whittier, California. Selected
stock for sale; inspection invited.

Cactus and Trees—Cash Nurseries, Seba-
stian, Cal.

MACHINERY

USED RANCH MACHINERY. PUMPS,
WINDMILLS, TANKS, ENGINES,
HAY MACHINERY, PUMPING PLANTS,
SPECIAL SNAP. 18 H. P. Stover, com-
plete with extra fine two-step Byron
Jackson deep well centrifugal pump, all
pipe and fittings, belting, tools, etc. Com-
plete plant for \$395. Pump alone cost
more than we are asking for whole plant
and it is all like new.

THIS WEEK ONLY: 5 H. P. Lambert
engine and fine Gould pump jack with 16,
18, 20 inch stroke for \$150.

2 H. P. Fairbanks with fine new jack
\$80, or with No. 2 centrifugal pump at
same price, also MANY OTHER SIZES
EQUALLY AS CHEAP.

TANKS TANKS TANKS
Brand new 1000 gal. Galv. \$19.50, 2000
\$29.50, 75c extra to put on cars. 3000 Red-
wood with 24 ft. Stand \$35; 25,000, \$85;
30,000 with 40 ft. tank stand, \$175; 50,000
with 30 ft. tank stand, \$300.

WHY BUY NEW? SAVE HALF.

MATERIAL GUARANTEED.

PUMPS, PIPE, CYLINDERS, RODS,

WINDMILLS, TANKS.

8-ft. mills, \$19.50; 10-ft. \$27.50; 12-ft. \$45.

H. P. BALER, \$90; SOUTHWICK power
baler, \$350, cost over \$700; WHITMAN
power baler, \$200. Steam tractor with
complete baling outfit, \$600.

Mowers, Rakes, Sprayer, harrows, po-
tato, beet machinery, Fan Mill, Corn
Sheller, small ranch tools.

ENGINES, PUMPS, BOILERS

Eighty H. Boiler, Smith Valve Steam
engine 14x18 and Compressor 12x18, \$1000,
cost \$6000. Absolutely cheapest service-
able material can be produced for. Pio-
neers in our line. DEMMITT CO., UP-
STAIRS, 120 N. Main, Los Angeles, Yard,
816 Yale. Buy Tools of All Kinds.

For Sale—Used and new Gas Engines, 2
H. P. up, rebuilt and fitted with modern
equipment. 22 years' experience enables
us to repair and rebuild Gas Engines cor-
rectly. Get prices. Lloyd, 806-808 N. Main
St., Los Angeles. F7020—Broadway 4103.

For Sale—One 15 H. P. Western gas
engine in good condition with fuel tank,
all necessary pipe and fittings, batteries,
etc. Also one Gould and one Price No. 4
horizontal centrifugal pumps. Cheap.
Hugh T. Thomson, Orange, Cal.

POULTRY

Just Out—The Cultivator Poultry Book.
"Poultry for Profit," by Jean A.
Koethen. Published by the Cultivator
Publishing Co. Highly endorsed by ex-
perts. Over 200 pages, 50 illustrations.
Contains simple methods of avoiding and
overcoming difficulties. A guide to poul-
try success under Western conditions—
it tells what to do, why to do it, and how
to do it. Nicely bound in cloth. Price
\$1.00 postpaid, or with Cultivator one
year, \$1.75. Send orders to Cultivator
Publishing Co., 115-117 North Broadway,
Los Angeles, Cal.

Baby Chicks—Rhode Island Reds and
White Leghorns. My guarantee safe
arrival, full count, strong, vigorous; fine
bred chicks, Leghorns, \$9.00 per 100. Will
lay in five months. Reds, \$11.00 per 100.
Will lay in six months. J. W. Lyon, Gar-
dena, Cal.

Poultry Wanted—We pay the highest
market price for all the local poultry
we can get, no matter how large the
quantity; also fresh ranch eggs. We re-
mit immediately. National Poultry Co.,
607 E. Third St., Los Angeles, Cal.

Baby Chicks—Electric Hatched. White
and Brown Leghorns, R. I. Reds, Barred
Rocks, Black Minorcas and Anconas. Spe-
cial prices for June and July. The OR-
LAND HATCHERY, ORLAND, GLENN
CO., CALIF.

Barred Plymouth Rocks—"The kind that
Lay and Win." Choice stock for sale.
Catalog free. C. H. Vadden, Los Gatos,
Cal.

First-Class Chix—White, Brown Leghorns,
R. I. Reds, B. P. Rocks, Buff Orping-
tons for September and later. Stock guar-
anteed. Hawkeye Hatchery, Turlock, Cal.

FARM LANDS FOR SALE

Apple Orchards—Large and small, in the
only apple producing section in Califor-
nia. The greatest section west of Mis-
souri River. Write for booklet. Geo. W.
Sill & Co., Watsonville, Cal.

LIVE STOCK

Billiken Herd—Pure bred, pedigreed O. I.
C. swine; the big white kind. Ready
for immediate shipment; weaned pigs of
both sexes; pairs and trios; mated not
akin. All these pigs are from big type
stock, of extra heavy bone; weight with
early maturing quality. Immunized
against hog cholera; crated and registered
free. Write for descriptive circular and
price list. C. B. Cunningham, Mills, Sac-
ramento County, California.

Hogs—Forty head of BIG TYPE PO-
LAND CHINA boars of any age. Sired
by IOWA WONDER, who is a son of A
WONDER, the greatest hog living or
dead. No females to sell at present. On
account of large number on hand will
make special prices. Geo. A. Smith,
Corcoran, Cal.

Grape Wild Farm Thoroughbreds—Guern-
sey Bulls of A. R. B. breeding. BERK-
SHIRE HOGS. Finest Lard in the state.
All ages for sale. A. B. Humphrey, pro-
prietor. Mayhews, Sacramento Co., Cal-
ifornia.

Cholera Immune Berkshire Pigs—All ages.
Registered Holstein bull. Prairie Pie-
tertie 107062, three years old—gentle and
guaranteed. Selling to avoid inbreeding—
\$300.00. Ricconi Bros., Mountain View.

For Sale—Registered. Berkshires: 25
choice pigs of best breeding from the
best strains in America. For prices and
description address H. L. Murphy. Per-
kins, Sacramento Co., Cal.

Hogs—A few thoroughbred Hampshire
Boars for sale. Reasonable prices. L.
P. Conway, P. O. Address, Sawtelle, Cal-
ifornia. Sunset Phone, Santa Monica
565 M.

Blatchford's Pig Meal weans pigs easily
and safely; no trouble; no milk. Write
for free folder, "The Safety Route from
Pighood to Porkage." Coulson Co., Petal-
uma.

For Sale—At all times, Jacks and Stal-
lions, driving and saddle horses. Price
and stock guaranteed. Phillips and
Kingsbury, 2318 G Street, Sacramento.

Berkshires—Pedigreed Boars ready for
service. Bred sows, weanling pigs, both
grade and thoroughbred, finest stock. C.
H. Thompson, Novato, Cal.

For Sale—Bred sows and gilts. All cholera
immune—and extra choice large stock.
Main 1326—F-6350. Mr. Hill, 429 Union Oil
Bldg., Los Angeles, Cal.

Poland Chinas—Young stock; either sex.
Write for pedigree. Reasonable prices.
Edwd. A. Hall, Watsonville, Cal.

Glenview Poland China—Stock for sale.
Chas. R. Hanna, R. F. D. No. 3, River-
side, Cal.

Poland China Bred Sows—Bred gilts and
4 months old pigs for sale. D. M. Clark,
Arlington, Calif.

For Exchange—Equity in Long Beach re-
sidence for dairy cows. Smith, 1080 Tem-
ple street, Long Beach, Cal.

For Sale—Thoroughbred Duroc Jersey
Boars and Gilts, strong and vigorous
stock. Fred Hart, Exeter, Cal.

Berkshires—Boar pigs for sale, Butte City
Ranch, Butte City, Glenn Co., California.

N. H. Locke Co., Lockeford, Cal.—Choice
young Jersey bulls for sale.

WANTED

Position Wanted—By experienced dairy-
man and wife. Capable of taking com-
plete charge of dairy ranch or would like
to lease such a ranch. Must be near
school. H. J. Bateman, College City, Co-
lusa Co., Cal.

Good Territory open for agents or fer-
tilizer salesmen in California to handle
Radio-active-earth (Radium residue) for
mixing with fertilizers. A. M. Wells, 633
Van Nuys Building, Los Angeles, Calif.

Wanted—Second-hand cream separator in
good condition. Sharpies preferred.
Give full description and price. John
Hull, Nestor, Cal.

Wanted—To hear from owner of good
farm or unimproved land for sale. C.
C. Buckingham, Houston, Texas.

Wanted to hear from owner of Farm or
Fruit Ranch for sale. O. O. Mattson,
Minneapolis, Minn.

RABBITS

Leading Rabbitry in America—Flemish
Giants a specialty. Prize winning and
heavy weight stock. Scored and sold on
their merits. Inquiry and inspection so-
licited. Catalogue on request. Empire
Rabbitry, Empire, Cal.

Bosworth's Imperial Red New Zealand
Hares sold at hard times prices. NOTH-
ING BETTER. Geo. M. Bosworth, Gey-
serville, Cal.

Caldwell's Royal Red New Zealand
scored and sold on merit. Catalog free.
Caldwell Bros., Box 613R, Los Angeles.

MUSICAL INSTRUMENTS

Special Piano Offer to country buyers, for
a short time only. Any piano or player
piano at \$100.00 special discount. Ten dif-
ferent standard makes, styles and finishes
to select from. Act quick. Address
GIRARD PIANO COMPANY, 517-519 14th
St., Oakland, Cal. Established 1873.

We repair, buy, sell and exchange musical
instruments; used instruments, good as
new, sold cheap. Write for bargain list.
Bolander's Fiddle Hospital, 52 Second
street, San Francisco.

SCHOOLS AND COLLEGES

Wanted—About seventy-five young men
and women to enter The WESTERN
NORMAL on August 30th, to prepare for
teaching. Western Normal graduates se-
cure and hold good positions. We assist
graduates to secure good positions and
promotion. We save you time and money.
For information, address, WESTERN
NORMAL, J. R. Humphreys, Principal,
Stockton, Cal. 634 E. Main St.

Telegraphy—Stenography, bookkeeping,
English branches. Positions guaran-
teed. Mackay Business College, Los An-
geles.

MISCELLANEOUS

Free for Six Months—My special offer to
introduce my magazine "INVESTING
FOR PROFIT." It is worth \$10 a copy to
anyone who has been getting poorer while
the rich, richer. It demonstrates the
REAL earning power of money, and
shows how anyone, no matter how poor,
CAN acquire riches. INVESTING FOR
PROFIT is the only progressive financial
journal published. It shows how \$100
grows to \$2200. Write NOW and I'll send
it six months free. H. L. Barber, 430, 28
W. Jackson Blvd., Chicago.

"Smith's Pay the Freight"—To reduce
the high cost of living, send for our
Wholesale to Consumer Catalogue. Smith's
Cash Store, 112 Clay St., San Francisco.

SEEDS AND PLANTS

For Cattle, Hog and Poultry Forage plant
now Luther Burbank & Mediterranean
Sneless Cactus. ROBINSON CITRUS
NURSERIES, R. F. D. 35-A, San Dimas,
Cal.

Burbank Spineless Cactus—Hardest vari-
eties, "Melrose" and "Special." Strong,
matured slabs. \$3.50 per 100; \$50 per
1,000. Labranza Ranch, Athlone, Merced
Co., Cal.

DUCKS

Ducks—High Class Mammoth Imperial
Pekin Ducks for breeders. Also young
ducks and eggs for sale. Best stock in
California. Stone Canyon Poultry Farm,
near Sawtelle, California. P. O. Address,
Sawtelle. Sunset phone, Santa Monica
565 M.

BEES AND HONEY

For Sale—200 stands of bees in eight
frame, two-story, standard hives at
\$3.50 a stand. Also 500 stands, two apiar-
ies, in two-story, ten-frame, standard
hives at \$4.50 a stand. Apiaries fully
equipped for extracted honey. Will sell
or lease locations. H. J. Warr, R. F. D.,
Box 10, Ferris, Cal.

FOR EXCHANGE

For Exchange—Owners only: Boston sub-
urban home, value \$8500, clear; 12-room
house, perfect repair, central, best street
and neighborhood. Want 10 acre ranch;
S. D. Co. preferred, near coast, young
trees, good house; submit. W. C. Corey,
220 Devonshire St., Boston, Mass.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade.
The live stock and poultry industries
are a specialty with us. Two thousand
illustrations to select from. Write for
prices and samples. The Kruckeberg
Press, 237 Franklin St., Los Angeles

Developing, 10c per roll. Printing, 2 1/4 x 3 1/4,
2 1/2 x 4 1/4, 3c; 3 1/4 x 4 1/4, 3c; 3 1/4 x 5 1/2, 4c.
Denver Store, 706 S. Hill St., Los Angeles

THE DISK HARROW

By C. A. Bacon of the I. H. C. Service
Bureau

The disk harrow if properly used
will turn the farmer more profit than
any other tool which he owns, and it
is equally true that if this implement
if misused it will cause a great deal
of loss.

Every farmer should understand
thoroughly why he disks. The mere
going over the ground with a disk
harrow doesn't necessarily mean that
the farmer is deriving any benefit
from it (nor does it mean that he isn't.
The farmer must understand the rela-
tion of moisture to the soil and growth
of the plant and what is necessary to
conserve moisture. This is essential
to the farmer's greatest success, no
matter where he farms.

Up to the present time the disk
harrow has been the most practical
implement for the farmer to use in
preparing a perfect seed bed. It has
been demonstrated time and time
again that farmers who thoroughly
disk the stubble immediately after the
grain is harvested, plow a few weeks
later, disk the ground the next spring
as soon as they can get onto the field,
and follow it up at intervals to keep
a soil mulch on the surface until sow-
ing time, have harvested from five to
25 bushels more per acre than their
neighbors who did not follow this
method.

All farmers know what a cloddy
field means. When ground is in this
condition, a disk harrow must be used,
but how many farmers realize that if
the ground is thoroughly treated with
the disk harrow in the right manner
they never would be troubled with
clods?

Generally speaking clods are the re-
sult of two causes. First the ground
is plowed when too wet and bakes in
the heat of the sun. Second the
ground is plowed when too dry.

The great percentage of cloddy
ground comes from the too dry plow-
ing. The farmer who follows the
binder with a disk harrow, thoroughly
pulverizing the ground, puts it in the
right physical condition to bring mois-
ture from the sub-surface to soften
the hard ground. This makes plow-
ing easier and turns over a moist stub-
ble free from clods.

While the farmer is following the
binder with a disk harrow he is also
conserving the moisture for the next
year's crop. If the stubble is left
standing the ground-cracks constantly
increase and the moisture evaporates
more readily, drawing out before the
winter season approaches a great per-
centage of the water that is left in
the ground after the crop is harvested.
A great many farmers, particularly in
the semi-arid regions, have used the
disk harrow, partially following the
rules laid down by dry farming au-
thorities, and having met with dismal
failure, they have condemned the disk
harrow. The trouble of these farmers
was with themselves and not with
the so-called system of dry farming,
nor with the disk harrow. It requires
water to grow crops. Those farmers
who made this failure undertook to
disk the ground after it had become
thoroughly dried out. Moisture can-
not be conserved if it isn't in the
ground. If those farmers who made
this failure will take special pains
to follow the correct principles of
farming during the year when they
have rainfall they need not worry
about their ground drying up and
blowing away, or about the disk har-
row being a failure.

It is a well known fact that dry
farming cannot be conducted without
the use of the disk harrow because
the disk puts the soil in the proper
condition to drink in all of the rains
and conserve the water for future use
as well as to retain that moisture
which is already in the soil. This has
been demonstrated so many times that
there is no question about it. The
farmer who has trouble with his
ground drying up and blowing away
after he disks it, whether he knows
it or not, has done this work after the
moisture is gone. It is the same thing
as locking the barn after the horse is
stolen. Every operation that a farmer
performs with a disk harrow both
directly and indirectly conserves mois-
ture. Killing of weeds, stirring of the
soil for aeration and warmth are all
directly connected with moisture con-
servation. From this it goes without
further reasoning that the farmer who
makes a thorough study of the
amount of moisture it requires to grow
any given crop and uses the disk har-
row to conserve that moisture, must
of necessity raise that crop, as far as
moisture is concerned. The conserva-
tion of moisture depends upon the
breaking up of capillary connection
on the surface of the ground and hav-
ing the soil particles in the subsurface
in the proper physical condition for
capillary attraction. This condition is
to have the ground free from air
spaces, large lumps, large foreign sub-
stances such as corn stalks, corn stalk
roots, bunches of manure, unpulver-
ized straw, etc. These foreign sub-
stances prevent the particles of soil
from becoming compact and firm; a
firm, compact soil is necessary for
capillary attraction.

The farmer who thoroughly under-
stands these things and sees to it
when the seed bed is prepared that
there is nothing in the ground to pre-
vent the compactness of the soil
particles, and who keeps the mulch on
the surface, need not worry about
crop failure. This means the use of
the disk harrow to cut up the corn
stalks and roots, to slice the stubble
furrow before the plowing is done, and
then before the crop is sown to disk
the ground every time a little crust
begins to form and so break up the
capillarity with the surface. If the
farmer lives in a district where it is
necessary to practice dry farming and
discovers that he hasn't moisture
enough in the ground to grow a crop
in any given year, plowing of the
ground, summer fallowing with a disk
harrow to drink in all the summer's
rain, will put him in a position to
grow three crops in five years in the
worst times. The farmer who lives
where the rainfall is abundant, by
following this method will never have
a crop failure, even in those years
when he thinks the season is dry.

Questions and Answers

THE EDITOR

AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Roup

Plymouth Rocks, one and two months old, have disease in their heads which is like cold. Run at nostrils some, but more have heads stopped up. Chicks also sneeze and with some effort. As disease advances the breathing sounds wheezy and their eyes become watery. What is this and how can I cure it?—Subscriber, Lytton.

Your chickens have taken cold and it has developed into a mild form of roup, which is, after all, only another name for a catarrhal cold. The first thing to do to cure it is to find out the cause. I suspect your chickens sleep in overcrowded or unventilated coops, then they come out into the chill morning air and begin to sneeze or snuffle. Perhaps there are unremoved droppings in the coops. Nothing will more surely cause, roup than sleeping in close quarters where the air is poisoned by filth. Rocks two months old are old enough to roost in trees or wherever they wish, and the month-old birds should have open-front coops. Some of my Orpingtons took to the trees last summer at the age of five weeks, and you may be sure there were no colds. A little vaseline rubbed on the heads will help the sticky eyes, and a half-grain of quinine all round would do no harm, but the main thing is sanitation. Give them fresh air night and day, plenty of clean ground to run on, clean coops and green feed, and there will be no need of doctoring. If you are in doubt as to your chicks' need of air, go to their coop in the evening, open it and notice the odor of air that comes out. If you would not like to breathe it, be sure they do not.—J. A. K.

Ginger

We recently had a request for information as to the possibility of growing ginger as a commercial crop in California. We referred the matter to Dr. J. Eliot Coit of the state university and Dr. Coit writes:

"I apprehend that on account of the fact that the plant prefers a moist, tropical climate it may possibly not do its best in our dry atmosphere. However one can never tell about these things without experiment, and it would be interesting to try the plant in the Imperial and Coachella Valleys. I find very little on the subject of ginger culture. There is an article on methods of ginger culture in Southern India in the "Indian Gardener and Planter;" also "Ginger Culture," by G. Landes, Queensland Agricultural Journal. There are descriptions of many varieties of ginger in the 1909 Annual Report of the Agricultural Stations for East Bengal and Assam, 1909.

"Referring to Macmillan in "Tropical Gardening," I find the following:

"The ginger plant, Zingiber officinale, is an herbaceous perennial with leafy shoots which grow about 18 inches high. It is a native of India but has been introduced and is now cultivated in all tropical countries. Commercial ginger comes chiefly from India, Ceylon, West Africa, Japan and Jamaica, the highest-priced grade of ginger coming from the last named place. The underground rhizomes or thickened roots are dug, washed, scalded with hot water, the outer peel is removed by hand with knives and the remainder dried, when it is ready for market. Prices in London vary from 40 to 80 shillings per hundred weight. The plant is propagated by divisions of the rhizomes which are planted in rows two feet apart with about 14 inches between the plants and the rows. The crop is ready to harvest ten months from time of planting. Under favorable circumstances the yield may reach 2500 pounds of cured ginger per acre, but

the average is about 1200 pounds."

"One should consider the economic conditions obtaining in this country before going into ginger culture. Even should the plant succeed under ordinary conditions it is a question whether it can be dug and prepared for market with our high-priced labor, competing with the cheap labor obtaining in those countries which now produce commercial ginger."

Special crops like the above and certain medicinal plants are worthy of fullest investigation and of experimental planting before entering into their production on a large scale. It sometimes looks attractive to the farmer to grow those crops which others are not growing, but it must be borne in mind that to dispose of such crops often requires more skill than to dispose of staples. Drug manufacturers are encouraging general planting of various plants used in the manufacture of drugs. This may result in keeping in this country vast sums now sent to foreign countries for these products, but the individual farmer should know his ground before entering into this new work.

Estimating Tonnage of Hay by Measurements

How many cubic feet of hay are there in a ton of oat hay that has been stacked two weeks?—Subscriber, Santa Rosa.

To make a fairly accurate estimate of hay in mow or stack the character of the hay must be considered, that is, short hay with large heads will weigh heavier than that with coarser, longer straw; also the manner and amount of packing when put away or stacked; also the size of the stack, for the larger the stack the more compact the lower portion will be. Perhaps as fair an estimate as one could arrive at would be to take 500 cubic feet to the ton with newly stacked hay. Of course for very closely packed hay perhaps 400 or 450 would be nearer correct.

Subirrigation

Is there such a thing as subirrigation and how is it secured?—Subscriber, Tulare.

Some lands slope away from the higher hills in which there is an abundance of water underlaid with a stratum of gravel which carries moisture and thus naturally subirrigates the land. Such lands are valuable and there are altogether too few of them in the state. There have been many efforts to secure similar results by embedding porous or perforated pipes in the ground at a proper depth to thoroughly subirrigate the land. This has been found extremely expensive and while satisfactory for the first year or two has not proved so after roots have had opportunity to fill up the pores or

openings. Subirrigation is attractive for the reason that it may give a maximum of crops with minimum of moisture. However, the difficulties have been so great that it is not, and probably never will be, generally followed.

Winter Pasture Crop

I have ten acres formerly in alfalfa on which I have grown a crop of wheat. I want to irrigate and plow and seed to some small grain. I wish it for fall and winter pasture and in the spring will plow under what is left for green manure. What is the best crop to plant, rye, winter wheat or what?—Subscriber, Bishop.

Mr. W. S. Guilford writes. I would suggest Egyptian corn, feterita sorghum or milo for the summer crop and barley for the winter crop. There is no question but that some of the corns or sorghums would give better results for the summer crop than any grain, and I believe that barley has proven a safer crop as a general thing than wheat or rye, although either one might make a good crop. I doubt if the feeding value of the crop from the three grains would be materially different in value from the same land and under the same conditions, providing they all matured all right, but as before stated I would chance the barley rather than the wheat or rye.

Removing Bitterness from Apricot Kernels.

We had a request recently for method of removing bitterness from apricot kernels. The matter was referred to Sales Manager Bolster of the California Cured Fruit Exchange, and he answers: "We export apricot kernels which have formerly been shipped mostly to Germany, but this year they are being sold to England. We cannot tell you their process for taking out the bitterness but they do manufacture both "almond" paste and prussic acid from the apricot kernels. However, we are not informed regarding the process."

Raising Turkeys

I wish to raise turkeys next year. Will females hatched in May of this year, mated to two-year-old males, produce progeny of living strength?—Subscriber, Lakeside.

If the stock is vigorous and the male not related to the females there is no reason why a mating of two-year-old males to hens nearly a year old should not produce a fair per cent of good livable poults; but the progeny will be larger and probably stronger if young males are mated to two-year-old hens. Much depends on the size and vigor of the male bird. He should not be over standard weight, but if he is under weight the young birds will rarely reach the size they should.—J. A. K.

The Swiss government has purchased in Venezuela about 15,000 oxen to use for food. The first shipment of the cattle is expected to reach Switzerland during the month of August.

A press dispatch from London announces that the British government has placed orders with Ontario firms for jam to the value of \$2,500,000.

THE USE OF THE CHECK BOOK.

Farmers who do most of their business by check can with little effort keep a very satisfactory account of the total farm receipts and expenses. Two things are essential for the success of this method.

First, all money received from any source, whether in cash or by check, should be deposited in the bank. By doing this the record of deposits will give the entire farm income. Most important of all it insures against any moneys being spent without a check or stub to show for it.

Second, when drawing checks care should be used to state for what purpose drawn. In this way the check stub will give an itemized account of the farm expenditures.

Under this system checks for money for personal use are drawn in the same way as for any other purpose. At times the purchase of minor articles for farm use will require cash when the amount is so small that it is not desirable to use a check; therefore to have an exact record a memorandum of the farm items which are paid out of the money checked out for personal use is needed. That is, these items should be charged to the farm, but they are really paid out of the pocket money which is charged on the check book to the personal account.

A memorandum of produce exchanged for groceries is also necessary, as there is no cash transaction in such cases.

In using this system it is better to have a large book of checks, which, if the farm business is of moderate size, the banker will gladly furnish with the checks numbered and the owner's name printed on them. A check book of this kind will generally last for a year—thus the advantage of having all the accounts in one book. This check book system as an aid to keeping financial accounts on the farm is very simple and will prove valuable to a large number of men whose business is adapted to it.—E. H. Thomson, in Farm Management Monthly.

CABBAGE GROWING

"Cabbage Growing in California" is the title of Bulletin or rather Circular 130, by Stanley S. Rogers, issued by the agricultural experiment station University of California. It is an illustrated circular of 22 pages and gives early history, types and varieties, soils, moisture, climatic requirements, care, time of planting and various other cultural directions to follow with the cabbage crop. There is a description of pests affecting the crop.

All sensible people who have the means and opportunity, recuperate themselves by frequent pauses for recreation. They do not defer this period of pleasure until the closing months of a worn out life. They are too wise to expect impossibilities of nature—the recuperation of an utterly exhausted body. They are grateful to Heaven that they possess the means which is wisely used to prolong a useful existence.

It is not hard work or lack of comforts that make the lines in the faces or the shadows in the eyes!

Use Corn Syrup in Preserving

Best Results Secured by Using Part Sugar and Part Syrup

Now that the preserving season is again at hand, every woman should know a little secret demonstrated by both American and English manufacturers of high grade preserves, after much experimenting on their part. This is, that much better results can be obtained if part corn syrup is substituted for all sugar.

The corn syrup being less sweet, more of the natural flavor of the fruit is retained. When using sugar alone, so much sugar is required to obtain the thick, heavy syrup desired by most housewives that the product is made too sweet. Also in making jams and jellies, especially from such fruits as grapes, where the natural sugar of the fruit is inclined to crystallize, the use of corn syrup will absolutely prevent crystallization.

It goes without saying, of course, that the best results cannot be obtained if an inferior corn syrup is used. The best domestic science schools recommend the brand known as Karo (Crystal White) for this purpose, and train their students to blend sugar and corn syrup in preserving. Karo (Crystal White) can be obtained of all modern grocers. In ordering, ask for the little Karo Cook Book, which contains much valuable information on preserving

Is Your House Over-run With Ants?

Read the Following Simple Method of Exterminating This Plague

A house over-run with ants is not a pleasant proposition, but it is not the serious matter that it used to be. There was a time when it was practically impossible to rid a house of ants. Now, however, it is comparatively a simple matter.

This is due to the fact that a paste has been discovered which appears to have an almost supernatural power over ants: It not only drives them out of a house or store immediately, but keeps them out afterward. Thousands of enthusiastic testimonials bear evidence as to its efficiency.

This remedy is being put up for general use under the name of Kellogg's Ant Paste and can be obtained at all drug-gists. It is the little sentinel which will guard your house against ants. Try a package today and be convinced.

MAKE MONEY OUT OF JIMSON WEED LEAVES

It is amusing to note that the leaves of Jimson Weed, owing to the European war, now command a value. Any school boy in California can make \$2.00 to \$3.00 a day picking the green leaves. The Haas Seed Co., No. 1800 Lincoln Avenue, are paying 1½ cents a pound for the fresh green leaves. All you have to do is ship them in a clean grain sack to the concern and get your money by return mail. They pay the freight. Any quantity shipped providing it is not less than 25 pounds will be received by them and paid for. Now is the time to pick them when they are in blossom.

Write for instructions how to pick and ship them to the Haas Seed Co., 1800 Lincoln Ave., Pasadena, Cal.—Adv.

Flyless Homes

Make yourself not-in-the-way inexpensive no baiting mosquito and fly trap from plans sent on receipt of 50 cents. Eliminates in-the-way traps, sticky and poison papers. Greatest catcher of flies and mosquitoes ever invented. Satisfaction guaranteed. Why not be our agent in your neighborhood. Send 50 cents now for full details to FLYTRAP CO., Longbeach, Cal. Reference: Any Bank in Longbeach.

Patents

that protect, 'careful honest work in every case. Patent your ideas, they may bring you wealth. 54 page book free. Including list of inventions wanted. Address FITZGERALD & CO., 880 F. Street, Washington, D. C.

Woman began her career as a rib; now she is the whole umbrella.

A PROCESSION

Did you ever happen to think, when dark
Lights up the lamps outside the pane,
And you look through the glass on that wonderland
Where the witches are making their tea in the rain,
Of the great procession that says its prayers
All the world over, and climbs the stairs,
And goes to a wonderland of dreams,
Where nothing at all is just what it seems?

All the world over at eight o'clock,
Sad and sorrowful, glad and gay,
These with their eyes as bright as dawn,
Those almost asleep on the way;
This one capering, that one cross,
Plated tresses or curling floss,
Slowly the long procession streams
Up to the wonderland of dreams.

—Harriet Prescott Spofford.

THROUGH THE LOCK

PETERKIN was all ready to go; his tan-colored shoes and stockings were on, and even his best cap was in his hand, when his big brother said, mysteriously, "You will have to go through a lock you know."

Now Peterkin did not know, but of course he did not want to say so. There was no time to ask grandma, and he had to start on his journey wondering how he could get through a lock. If it was a padlock it would have to be enormous just to let him through the loop part. If it was in a door—well, it was no use to worry, because he could get through it if Uncle Frank, who was going with him, could.

The evening before Uncle Frank had said, "I am going up to Harrisville by boat tomorrow and I should like to have Peterkin go along to take care of me, if you are willing." Peterkin's mother was willing, and early this bright, cool morning the two travelers were on the little steamer, ready for their trip.

For several hours they sailed up a beautiful lake. Then, just as they came to the end of it, and Peterkin feared that the journey was all done, they sailed up a little river which flowed into the lake.

"Are we most there?" Peterkin asked, regretfully.

"Oh, no, only about half-way," answered his uncle. "The river joins two lakes, and we are going to the upper end of the other. Now watch for the lock!"

The lock again! Uncle Frank went on reading and Peterkin began watching. There was nothing to see but water and trees. In one place the river twisted like the letter S, and a boat that had been following them seemed to be going in the opposite direction. Peterkin would have watched it between the trees if he had not been looking for a lock. Would it hang on a big tree? There did not seem to be anything else to fasten it to.

"There it is!" exclaimed Uncle Frank, glancing up from his paper just as the river made a sudden bend. "I always like to see a boat go through a lock."

It was more puzzling still. The boat also must go through!

"Did you ever go through a lock before?" asked Uncle Frank.

Peterkin confessed that he had not. "Come forward with me, then, so that we can see just how the boat is lifted. A lock is really a big stair. The second lake is eight feet higher than the first, and we must step up there somehow. We cannot sail up such a hill, and so we will take one long step instead. Here we go into the lock!"

In a moment two great gates were closed behind the steamer. In front of the steamer were two more gates,

which had been closed all the time the boat was entering the lock.

"Now we are locked in," said Uncle Frank.

Sure enough, they were. There were gates in front, gates behind, and the banks on each side built up with stonework.

"See that big white stone?" said Uncle Frank, pointing out one of the upper gates. "Now see the water reach it!"

The gateman opened two small, sliding doors in the great front gate, and the water from above rushed in. The water rose in the lock, and of course the boat went up, too. The water just reached the white stone!

They were up-stairs now, and there was nothing more to do but to wait until the big gates were opened, and then to sail out.

He watched carefully, and then gave a great shout of delight when they were safely out.

"Is this the only lock?" Peterkin asked.

"Yes," said his uncle, "the only lock. Now we go to the other side of the lake. It is all straight sailing now."

"And tomorrow, when we go home, do we have to down-stairs?"

"Exactly," replied his uncle. "When we start in the morning we shall be on the second stair. When we sail into a lock it will be the lower gates which are kept shut until we are safely in and the big gates close behind us. We shall be on the upper stair until the gateman opens the sliding doors in the lower gates; then the water will rush out, the boat will settle down to the level of the water below, and there we are—down-stairs."

Peterkin listened very attentively, and when he had thought it all out, he asked, "And we shall have to sail out when the gates are opened and go home?"

"Why, yes; but by that time you will be in a hurry to go home and tell mama about the trip and tell Carl that you have as good a key to the lock he spoke of as he has himself."

Peterkin did not understand the joke, but Carl did, and he laughed when he heard it.

"A better key, Peterkin," he said, "for I have never seen a lock."

Peterkin was so impressed by what he had seen that he tried all the next morning to make a similar lock in the little brook near the house.—Selected.

HOME REMEDIES FOR CHILDREN

Written for California Cultivator
By A. M. H.

Prickly heat, a complaint that many children suffer from during hot weather, is really a blood disorder and may be greatly alleviated, if not entirely cured, by a diet free from acids. An old fashioned remedy for cooling the blood is a teaspoon of cream of tartar in water. This frequently gives efficient relief and baths in bicarbonate of soda are good to use as an external application. Another good lotion to use is composed of two drams of sulphate of iron to which has been added two ounces of distilled water. This should be applied with a small soft sponge.

Colic is the complaint from which children suffer most and quick and ready relief may often be given with a drop of peppermint in a little warm water slightly sweetened, for one dose, and a warm application or hot water bottle near the stomach. Some mothers gently massage the child with warm sweet oil or melted vaseline, as it is comforting and will soothe the pain.

An excellent remedy for dysentery and all bowel troubles peculiar to children is made by boiling peach tree twigs in water to make a strong tea and giving one teaspoon after each evacuation. In stubborn cases inject one teacup lukewarm water, with a teaspoon of corn starch dissolved in it, in the morning and at night.

A bottle of boric solution is invaluable

in a family where there are many children, as there is no safer and more effective remedy for small cuts and wounds, and all skin diseases are soothed by being bathed with it. The solution is very inexpensive and easily prepared by putting one ounce of boric acid in an eight-ounce bottle and then filling with boiled or distilled water. This will make a solution that will last an almost indefinite time as more water may be added as the solution is used until all of the boric acid is absorbed.

When baby's skin is chafed, put a little of this solution in a little warm water and sponge the chafed skin after bath, then dry gently, apply a little cold cream and dust with good talcum powder. One of the best powders for infants and young children is made with one part boric powder and two parts of corn starch.

The boric acid solution makes an excellent wash for weak eyes and sore mouth and if used daily it will prevent sore eyes and sore mouth and keep the mouth sweet and clean, and it is a good plan to cut old, soft pieces of linen into small pieces and use a fresh piece each time the child's mouth is washed, as this will not injure the gums or teeth.

PROPER METHOD OF STEWING MEATS

Select the tough pieces of meat for stews. One important fact that Miss Mary Sutherland of the home economics department of Washington state college is endeavoring to impress upon the housewife is the fact that a cheap piece of meat which contains much refuse may be much less economical than a higher priced one, all of which is eatable. Cuts are usually selected from beef, lamb, mutton or veal such as the plate, navel, neck, shoulder, lower part of the round skirt steak, aitchbone etc. Stewing is a method of preparing meat by extracting juice to flavor gravy, and retaining the juice in the remainder by searing the meat. Wipe the meat and cut into suitable pieces for serving. Meanwhile divide into two portions, add one portion to cold water and heat to the boiling point. Set the other portion by browning in a little fat in a frying pan. Then add it to the water and meat. The whole should be cooked slowly for three hours, or until the meat is tender. Meat with some bone and fat makes a richer stew than one made with lean meat. Onions, turnips, carrots, parsnips and potatoes are the vegetables commonly used in stews. The vegetables should be cut into half-inch cubes or quarter-inch slices and added the last hour of cooking. The potatoes should, however, be parboiled five minutes, then added to the stew, allowing twenty minutes for the cooking. Sweet herbs, parsley, a bit of bay leaf, one or two cloves, celery salt, or catsup may be added to give variety. Salt and pepper are the usual seasonings. A nice way is to cook the vegetables separately.

Two pounds beef, three tablespoons flour, one turnip, one carrot, two onions sliced, four potatoes, salt and pepper, half bay leaf. Prepare according to above directions.

Authorities seem to agree in the estimate that in the United States about one-third of the total expenditure for food materials is for meat. They also agree that when the total expenditure

IDEAS FOR THE COOK

Written for the California Cultivator
By Isabel Cottle

Breakfast

Halves of Ripe Apricots, Cream
Fried Calves' Liver with Bacon
Baking Powder Biscuit
Raspberry Jelly
Coffee

Lunch or Supper

Salmon in Shells Potato Salad
Escalloped Corn
Lettuce and Mayonnaise Sandwiches
Gingerbread Warm Apple Sauce
Milk or Buttermilk

Dinner

Cold Roast Beef
Browned Mashed Potatoes
Stuffed Egg Plant
Summer Salad
Lemon Parfait Potato Flour Cake
Coffee

Soft Gingerbread

One cup molasses, one-third cup butter, one and three-fourths teaspoons soda, half cup sour milk, one egg, two cups flour, two teaspoons ginger, one-half teaspoon salt. Put butter and molasses in saucepan and cook until boiling point is reached. Remove from fire, add soda, and beat vigorously. Then add milk, egg well beaten, and remaining ingredients mixed and sifted. Bake 15 minutes in buttered small tin pans, having pans two-thirds filled with mixture.

Potato Flour Cake

Take four eggs and beat them separately and then together. Add the following ingredients: one cup of sugar, a pinch of salt, one tablespoon of cold water, one teaspoon of vanilla, and a good half cup of potato flour within which is mixed one rounding teaspoon of baking powder.

Lemon Parfait

Pour one cup of thick lemon syrup made by boiling until thick one cup sugar and one pint water, then adding one-third cup lemon juice over two beaten egg yolks. Cook in a double boiler until it thickens. Remove from the stove and when it is cool combine with one pint of thick cream beaten until stiff. Fill molds and pack in ice and salt for three or four hours. The addition of a spoonful of grape juice when serving or some grated pineapple will give pleasing variety.

Salmon in Shells

Remove skin, bones and oil from a one-pound can of salmon. Break into

bits. Add a chopped boiled egg, the same amount of bread crumbs. Stir into thickened cream or white sauce a cup for this amount. Fill clam shells. Top off with butter, and bread or cracker crumbs. Bake till brown and serve.

Summer Salad

Cook a quart of shelled fresh lima beans by boiling in salted water. Do not add butter. When done drain and chill. Peel and cut into very small dice two crisp, tart summer apples and chop fine two sweet, green bell peppers from which the seeds and ribs have been removed. Mix all together with mayonnaise dressing flavored with tarragon vinegar and a few drops of onion juice and arrange on lettuce.

HOW TO CAN STRING BEANS

The string bean season is on. Beans contain considerable protein, the muscle building element, and hence are a good substitute for meat. Several dozen quarts put up now will help out wonderfully in supplying the table with a good wholesome product during the coming winter.

The absence of acid and the presence of proteid substance in beans makes them difficult to put up successfully. The protein makes a fine food for bacteria and hence long boiling or cooking in closed jars is necessary in order to insure complete sterilization. The beans selected should be young and tender; remove strings, break into short lengths, blanch in boiling hot water for 2 to 5 minutes, depending on the texture; then plunge quickly into cold water. A wire basket or porous cloth, such as cheese cloth, may be used for blanching. Pack products tightly into the jars until full. Add boiling hot water to cover the beans and 1 level teaspoonful of salt to each quart. Place rubbers and tops in position. If the mason jar with screw top is used, leave the top about one-quarter turn loose to let the air escape. Economy jars can be sealed tightly; the spring and tin top will give sufficiently to permit the air to escape. Place the jars in the wash boiler containing warm water, using care to have a wire mesh, straw or cloth in the bottom of boiler and cloth or straw woven between the jars. The water in the boiler should nearly cover the jars. Process two hours in water constantly boiling (jumping hot). Remove, tighten covers and invert to test and cool.

Wrap your jars in paper and store. (Note—For elevations over 4000 feet, add 25 per cent more time for processing.)—University of Arizona College of Agriculture.

No kitchen can be attractive that is ill-lighted; and the color of the walls has almost as much to do with this as the size of the windows. Since a woman can, as a last resort, paint the walls herself—adding perhaps a pretty stencil border—there is no good excuse for having them other than cheerful and bright. It is not necessary to be an artist; directions given in the booklets published by our best paint houses are simple and the cost small.

It is the lack of love—love for your neighbors or your God or your dog if there is no one closer—and lack of play—play that will fill your heart with laughter and drive out the cares and worries that "infest the day"—that have given us the drooping mouths and the rounded shoulders and the starvation lines.

Have you made that dustless mop and dustless cloth yet from old underwear or stockings wrung out from oil and aired—three tablespoons linseed oil to one-half pint kerosene?

An excellent furniture polish that can be made at home is three tablespoons of olive oil to one of vinegar. Apply with a soft cloth and polish with flannel.

It is a wise plan to have a good, reliable pair of scales and to use them. Also, it may be wise to let the grocer and market man know that you use them.

Peas and spinach are much better color if cooked uncovered and a dash of soda helps all green vegetables to keep their color.

Kerosene

vs.

Wood and Coal

Heat concentrated on the cooking, not spread through the room.

Heating up the kitchen when it's already 90 in the shade.

Ready, like gas—full heat in a minute.

Bothersome—waiting for the fire to burn.

Adjustable heat—a slow fire or a hot one.

Difficulty in getting the right heat.

Heat only as long as you need it.

Waste of fuel before and after actual cooking.

A clean, cheap fuel—easy to handle.

Wood and coal to lug—dirt and ashes.

New Perfection Oil Cook-Stove

For Best Results Use Pearl Oil

The convenience of gas for homes without gas. No odor. Does not taint the food. Convenient sizes. Ask your dealer. See Exhibit, Palace of Manufactures, Panama-Pacific Exposition.

Cooling Dishes for Hot Weather

Helpful Suggestions for the Summer's Bill of Fare

During the hot summer months the heavy heating foods and drinks so general in the colder seasons should be avoided. The careful housewife, having the good health of her family in mind, should make a special study of the proper preparation of cooling and nutritious foods and drinks at this season of the year.

One of the most useful aids to the housewife in this connection is that delicious food product—Cornstarch. It seems a pity that the women of the country generally do not have a better knowledge of the immense variety of uses to which this product can be put. Especially during the hot weather, when a great variety of ice creams, frozen custards, frappes, etc., can be easily and quickly prepared by its use.

Undoubtedly many women have been disappointed when using cornstarch as a result of utilizing an inferior quality. Those who have had the best success with cornstarch recipes in all parts of the country invariably use the well-known Kingsford's brand—which can be obtained at all modern grocers. Order Kingsford's Cornstarch from your grocer today, and ask for the little Kingsford's Cook Book containing many valuable recipes for warm weather delicacies.

San Francisco-Los Angeles Produce Markets

HAY

Under date of July 10, Scott, Magner & Miller say:
The records for the week show the total arrivals of hay at San Francisco to be 3100 tons, as against about 4500 tons each week for the last few weeks. The 4th of July holidays were responsible for a decided interruption to our markets. However, at this writing normal receipts have been re-established and from now on will continue to move along satisfactorily. There appears to be very little trading done recently in the main hay sections. There is a better movement of alfalfa from the Sacramento river district. The quality is particularly nice and what is arriving is being distributed at practically the same prices that prevailed recently for old crop alfalfa. There has been very little straw coming to market.
We quote the average wholesale price of hay in carload lots on today's market as follows:
Fancy Wheat Hay (lt. bales) 13.00@14.00
No. 1 Wheat or Wheat and Oat 10.50@12.00
No. 2 Wheat or Wheat and Oat 8.00@9.00
Choice Tame Oat 11.00@11.50
Other Tame Oat 7.50@10.00
Barley 6.00@9.00
Wild Oat 6.00@8.00
Alfalfa 6.50@9.50
Stock Hay 5.00@5.50
Straw 40@45

GRAIN

Cocoanut Oilcake Meal	24.00@25.00

Citrus Fruit Market

LOS ANGELES, July 14, 1915.

A half a thousand carloads of Valencia's sold by the Exchange last week will bring to California in gold coin a half a million of dollars. None were sold at exceptionally long prices, but it was good fruit, the market is in fair condition, the general average is most satisfactory. Peaches are coming in in enormous quantities, but with judicious shipping of oranges yet to go there will probably be fair prices.
The lemon story sounds different for last week there were sold in New York City 10,000 boxes of Mediterranean lemons at 90 cents per box. However, the weather is materially improved from the lemon consumer's standpoint and it is possible the greater consumption will soon clear the market of the enormous quantity in the hands of retailers and jobbers. Then the 2000 cars now in warehouses in California will begin to move.
Shipments
Shipments of oranges to date from Southern California since November 1, 1914, 29,472 cars; lemons, 4919; total, 34,391. Last season to same date, oranges, 31,905; lemons, 2261; total, 34,166. From Tulare County, oranges, 5648; lemons, 200; total, 5848. To same date last season, oranges, 5873; lemons, 30; total, 5903. From Northern counties, oranges, 630; lemons, 2. Last season to date, oranges, 405; lemons, 5.

NEW YORK, July 12.—Valencias, two navel, four mixed cars and seven cars lemons sold. Market 15 to 25 cents lower. Lemons about 10 cents lower. Cloudy.

USE GARDEN HOSE ON INSECTS

Where city water pressure is available the garden hose often affords the easiest way of checking the ravages of certain insects, states Dr. A. L. Melander, entomologist of the Washington experiment station. Many people have the idea that strong poisons are required in controlling bugs, but this is

buhach or, for the hills, boiling water, or spraying the lawn or plants nearby with strong soapsuds or kerosene emulsion. Spraying the ground with a solution of cyanide of potassium will generally kill them off. Bear in mind this chemical is a deadly poison.

For larger ant colonies of other species bisulphide of carbon, a chemical which can be purchased at any drug store, will be found effective. This substance can be placed in the nest by means of an oil can or small syringe, the quantity required varying from one-half ounce for a small nest to two or three ounces or more for a large one. An oil can with a long spout is a convenient instrument, as it can be inserted into the nests and the liquid injected without its being brought close to the operator's nose, for the fumes of bisulphide of carbon, although not poisonous are nauseating. To facilitate the entrance into the nest of the chemical the ant hole can be enlarged with a sharp stick or iron rod. After the bisulphide of carbon has been injected the opening should be closed by pressure of the foot in order to retain the bisulphide. This will penetrate slowly throughout the underground channels of the nest and kill all the inmates. It is important to remember that while bisulphide is perfectly harmless if kept away from all fire, it is very inflammable and may under certain circumstances explode when ignited.

CITRUS IN SOUTH AFRICA

(Continued from page 53)

planted in Rhodesia are the Washington Navel, Thompson's Improved, Navelencia and Valencia Late oranges and the Villa Franca lemons. The wild lemon indigenous to the country is used chiefly as a stock.

Soils and Irrigation

Excellent loam soils are found and many classes of granite soils, some of which produce very fine lemons. Belts of decomposed sandstone are also found in some parts. Irrigation will probably be found advisable in all the citrus regions of Rhodesia. In portions of Mashonaland under normal conditions of rainfall citrus fruits may be grown successfully without irrigation.

Frosts, Insect Pests

Injurious frosts never occur in Rhodesia. Among insect pests the common soft scale, the Australian fluted scale and the red scale are found. The citrus codlin moth is the most destructive pest.

At present land of all kinds is exceedingly low in price.

CENTURY MAGAZINE

The movement and the color of war have ever been an inspiration to artists, but the latter as a rule, standing outside, have painted only spectacular moments, charges, victories, surrenders, and the like. In this war almost all the young artists of Europe are actually in the trenches and they see it intimately and familiarly as it is. At the request of the Century Magazine, Armand Dayot, French Inspector of Fine Arts and founder and editor of a well-known French art review, made an automobile tour at the front and collected sketches actually made in the trenches by friends of his, including some of the most gifted of the younger French artists. These drawings, fifteen in number, he has contributed to the August Century, where they will appear accompanied by an interesting interpretive text by M. Dayot himself. Sketched in moments of danger, to the sound of bursting shells, or in moments of forced leisure, the pictures and the article together are said to give a memorable impression of the French army in action and at rest. The Lookout, A Soldier's Family at the Front, Digging a Trench, The Card-party, and The Letter are among the subjects represented.

CARE AND REPAIR OF TIRES

The Care and Repair of Tires, a well illustrated book of 50 pages, contains a world of information for the automobile owner in giving proper attention to pneumatic tires. In issuing the book the company seems to be going upon the principle that it is not necessary to cause undue wear of tires in order that their concern may have business, but urges upon all users of its tires, or of any tires, intelligent care. For instance, we have one hint:

"The correct application, care and usage of tires are important things to consider, but it is essential to good service that the correct type and size be adopted. The tires should be large enough in diameter and cross section to carry the load and stand traction strains, which will be influenced largely by the power of the car and the lateral strains to the tire, governed by the tire construction."

We are not informed but doubt not the Firestone Tire and Rubber Company, Akron, Ohio, will be glad to send copy of this book if requested by any auto owner.

THE CONTROL OF ANTS

As a rule ants do but little harm in the garden. However, they are a nuisance and the colonies may spread and make life a burden in the house. The best control measure is usually secured by the liberal use of fresh

Cultivate with a "Baby" Creeping Grip Tractor

Here's the tractor that you have been looking for to handle your ranch work.

This Baby Creeper was designed for the small rancher, particularly the fruit rancher. It delivers 16 Brake and 10 Tractive H. P. and does the work of 6 good horses or mules.

It is low, gets under the trees, turns in its own length, its fuel consumption is very low and it does not require an expert operator

you how to secure

Your Water Supply at Small Cost

At last—a high-grade, efficient, dependable centrifugal pump at a low price. The Bean Irrigator introduces a new standard of pump values. Though the price is as low as the lowest—the pump is "Bean quality" through and through. If you're interested in irrigation you should learn about

Bean Centrifugal Pumps

For Downright Good Service They are Absolutely in a Class by Themselves

The Bean Automatic Water Balance eliminates end-thrust, thus saving much trouble. The Bean Water Sealed Stuffing Box makes excessive tightening of the stuffing box glands unnecessary. The shaft where it enters the pump

is entirely surrounded by water, which forms a perfectly air-tight seal with very little friction. Bean Runners are Enclosed, accurately machined and perfectly balanced. This means greatest possible efficiency.

SEND FOR BEAN CATALOG 28-B

It illustrates and describes the Bean line of Horizontal and Vertical Centrifugal Pumps, Bean Turbines, Direct Connected Outfits, etc. Tell us your pumping requirements. The experience of our irrigation specialists is at your command. For our general line of House, Windmill, and other Pumps, ask for Catalog 28-D. For Bean Opposed Gas Engines ask for Catalog 28-C. A postal will bring any or all of these catalogs by return mail.

Books

This list is prepared with the purpose of enabling our Cultivator readers to supply themselves with standard books at lowest possible prices. We call especial attention to a few of the new publications. "Citrus Fruits" by Professor Coit, of the University of California, covers all phases of the Citrus Industry under California conditions—the kind of a book we have had many calls for but never before been able to supply. "Productive Feeding of Farm Animals" by Woll, will command special attention. "Poultry for Profit" (The Cultivator Poultry Book) by Koethen, another California book, is new and excellent, telling what to do and what not to do with poultry in California; a sure guide to poultry success. The new Standard Encyclopedia of Horticulture, by Bailey, is not equalled by anything of the kind which has ever been published at any time in any language. Special terms of payment and discounts are offered by the publishers through us on this Encyclopedia. Write us about it.

Rural Californian combined with California Cultivator

Vol. XLV No. 4

LOS ANGELES: THURSDAY, JULY 22, 1915

One Dollar Yearly

Inexpensive and Permanent Arbor

Rightly Handled, Cement and Sand Make a Material Which Will Last as Long as the Hills and Which Does Not Involve Large Expenditure

N arbor, like the one in the picture below is so simple and easy to construct that it should appeal to farmers who are interested in making their premises beautiful as well as profitable.

The arbor consists of four octagonal cinder-concrete columns surmounted by undressed timber.

To construct the columns required three cubic yards of cinders and three barrels of cement. The work was done by one man in four days. This mixture, however, is too lean and unsafe for the unskilled worker to use, and the proper proportions of cement, sand and stone are given below.

The arbor is 8x12 feet. The columns are seven and one-half feet high, two feet at the base, and 18 inches at the top. Each has a foundation of concrete two feet six inches each way—in other words, a concrete cube of that dimension. A square form of boards was erected and corner pieces inserted to form the octagon. It was intended to give the columns a finishing coat of plaster, but they looked so well in their crude state that it was never applied.

Simple designs of this type compare favorably with the most costly and ornate conceptions, and are made at greatly reduced cost. Had the columns shown been elaborate in design and surmounted with dressed timbers it is questionable whether the arbor could have been built for less than \$100. Moreover, many people of good taste would prefer the more rude and simple pattern. These columns

An Attractive Concrete Arbor.

take their place in the landscape with the unobtrusiveness of a tree, while their rough surface is better adapted to the growing of vines than columns possessing a smooth surface. In fact, the column on the world-famous terrace at Amalfi are even more simple than these octagonal forms.

Two types of forms for constructing columns are shown in the line drawing. The form at the left is the more economical where it is the purpose to use it many times, but for a single operation, such as the arbor described, the form at the right with braces nailed instead of being fitted with bolts would be more economical.

The concrete could be mixed in the proportion of one part Portland cement, two parts sand and four parts stone or screened gravel, as cinders are not always available on the farm. It is important to remember that cinders do not mean ashes so it would be better to use the stone or gravel.

We recently saw a seat made of a pile of boulders, which had been in the way for some months, combined with a little cement and sand. The workmanship showed up rather crudely in the finished product but that will be mostly covered with vines in a short time and the unsightly boulders will become a thing of beauty and a material convenience. Had a professional done this job he could possibly have made a mortar from lime and sand which would have answered the purpose, but owing to its lack of strength it would have required more

(Continued on Page 95)

Sunburn and Insects Injure Trees

Blistered and Brownd Tree Trunks Give to Borers and Other Insects Opportunity to do Great Injury. J. W. Mills Tells California Cultivator Readers How to Prevent It

N passing through some of the deciduous orchards of Winters and Vaca Valley, one is struck with the table like appearance of the trees.

They have been pruned so as to force the main branches out horizontally, and this has been followed up by clipping back all the upright growth, leaving them bare and exposed to the sun, with the result that the borers have riddled the branches and they are badly decayed. The object was to expose the fruit to the sun so as to procure early ripening, which was secured, but at the expense of the early destruction of the trees. Had those branches been given a heavy coat of whitewash, no sunburn would have occurred.

We recently visited the orchards owned by Thurber Brothers in Pleasants Valley and saw where they had demonstrated to their satisfaction that allowing part of the past summers upright growth to remain to bear the fruit up above all the other growth, gave just as early fruit and

at the same time protected the main branches from sunburn. Part of the upright growth was cut back to produce new growth for the next season's crop. The plan they have adopted is exactly that followed when pruning long pruned grape vines. The long branch is left with a spur near the base from which new growth is secured for pruning and fruiting the next year. This is surely an improvement over the salver shape top. It is following nature more closely and will result in better trees and better fruit.

It is quite common to see branches in the tops of plum, and especially prune trees, with light colored foliage and from that running down to dead branches.

In nearly every case where there is a yellowish green cast of the foliage, except in case of brown mites or red spider, the cause can be traced to sunburn. It does not all happen in one season but gradually increases from year to year. When a heavy crop of fruit is set the

branches bend as the weight of the fruit increases till some branch is fully exposed to the glare of the sun and the branch is held in that position until it keeps its position even after the fruit is gathered. If the bark is not killed then it is slightly injured, and the following season the sun gets in some more deadly work, and the branch is injured so that it never will recover. The most frequent injury caused directly by this overloading process is found in the upper branches but at the same time the main branches are often uncovered and exposed to the sun, causing a more serious loss.

The first stages of sunburn can be detected by passing the fingers around the upper side of the branch where the exposure occurs. A slightly flattened area with an apparent ridge on each side will be felt. The ridge is caused by the border between the growing tissue and the tissue whose growth has been checked by the hot sun.

Remedy

Applying a heavy coating of white-

wash late in the spring so as to cover all the branches one inch and over in diameter will prevent the sunburn and save a large amount of valuable bearing surface. The whitewash spray should be applied as late in the spring as possible, just before the blossoms appear. A good whitewash is made by slacking 30 pounds of good quick lime in plenty of hot water, using enough water to keep the lime completely covered until all action has ceased. While the material is still hot add four pounds of tallow and stir thoroughly. Dissolve five pounds of stock salt by suspending it in a sack in water and add to the lime and tallow mixture.

Dilute to a consistency that will spray well and make a complete white coating over the branches. A nozzle that sprays from above is the best for old trees that have many horizontal branches. The spray material should be strained through a one-fourteenth inch mesh screen before putting in the spray tanks.

Don't Plant CITRUS TREES

until you can meet the five essential requirements of success. Here they are: Sufficient Water Supply; Quality Trees; Safe Thermal Conditions; Good Care; Good Soil.

These five things are fundamental and he who ignores any one of the five invites failure.

Good fruiting trees are good revenue producers, and if you have the requisite water, location and soil—true citrus land—you cannot afford to miss the opportunity to

Plant Citrus Trees

Place your order NOW for Spring delivery. You will perhaps never have another chance to buy **QUALITY TREES** at so reasonable a price. Even the so-called **CHEAP TREES** which might better be called **EXPENSIVE TREES** by the man who expects to receive an adequate return on his investment, are quoted the same or very little less.

We were founded twenty-five years ago, and have been improving the grade ever since. Buy **TEAGUE QUALITY TREES**, embodying vigor and symmetry of root, body and top—and in the selection of buds, which will not only be true-to-name in the general acceptance of the term, but true to the best type of the varieties to which they belong as well.

Write today for prices and particulars. No orders too large or too small to fill. All correspondence promptly answered.

CUT FERTILIZER COSTS

The cheapest commercial or barnyard fertilizer you could obtain costs from \$15.00 to \$40.00 per acre. Cover crop seed with inoculation so it will produce quantities of both nitrogen and humus, costs only \$3.00 to \$5.00 per acre. Farmogerm is the standard inoculation.

The Standard Inoculation

FARMOGERM

High-Bred Nitrogen Gathering Bacteria

is a moist, jelly-like substance, containing billions of nitrogen-gathering bacteria. It is put up in a patent bottle which keeps the jelly (containing bacteria food) moist at all times.

Bacteria cannot live long in cotton wads, granular media, or in any other dry state. The nitrogen-gathering bacteria live for years in the moist jelly-like media of Farmogerm.

Results Guaranteed

Prices: 1 Acre, \$2.00; 5 Acres, \$6.00; 50 Acres, \$55.00.

Our inoculation experts will gladly give detailed information regarding inoculation with **FARMOGERM**.

THE MISSION OLIVE

Written for California Cultivator
By J. W. Mills

THERE are some complaints in the southern part of the state that the Mission Olive does not bear full crops regularly or even often enough to bring them into much favor. We found the same failing occurred with this variety during our 14 years' experience in Southern California, and we concluded that climatic conditions were responsible for the failure of not only the Mission but many other varieties in certain seasons. The trees under my observation were thrifty and well cared for, blossomed abundantly, but during most seasons failed to set a full crop and seldom if ever produced a full crop on the west or windward side. The cold winds that blow in May from the coast seemed to cause the bloom to drop.

When proper climatic conditions prevail there seems to be no need of mixing varieties in order to secure a full crop of Mission, Sevillano, Ascolano or Manzanillo olives, provided the trees have not overborne the previous year and have made the proper growth during the preceding summer.

Pruning

The prevailing idea is that the tree must be topped, cut back like a deciduous fruit tree, and this has been my theory and practice until the past few years. The early olives bring the most money, my pickle sizes bringing from twice to nearly six times as much per ton as oil sizes, and not less than 80 per cent of these come from the tops and outermost branches of the trees, those closer in maturing last.

The olive is very susceptible to frost and those in the tops are the last to suffer. It is true that it is more expensive to pick the fruit from the long towering branches, but so long as that is where we get the finest and earliest fruit and the price received is more than double that received from the inferior grades, we will continue to grow our olives high up and far out in the sun shine. Thin out the tops so that from the next tree you can see as much sky through them as you can see top and the pruning will be none too severe. Laterals should be thinned out severely, say one third of them cut out entirely, or perhaps one-half of them, and half of the remaining laterals cut back half or more to grow bearing wood for the coming year. That will leave one-third to one-half of the last season's growth for fruit.

STUDY IN THE CITRUS

The University of California announces the securing of Dr. Howard S. Reed, formerly professor of plant pathology and bacteria at the Virginia experiment station. Dr. Reed will take up the study of various orcharding problems at the Southern California experiment station grounds at Riverside under the direction of Dean H. J. Webber. The questions which Dr. Reed will take up have been under investigation for several years in connection with the regular station work and he will bring to the field new experience and enthusiasm.

Regarding Dr. Reed's work: "The physiological problems of fruits and vegetables, their diseases, and hygiene for the plant have been the subject of a large number of important scientific papers published by Professor Reed since his graduation from the University of Michigan in 1903. In 1907 he won the degree of Ph. D. at the University of Missouri, after receiving special training in botany and organic chemistry and at the same time serving as acting professor of botany there. He was scientist in soil fertility investigations of the bureau of soils of the United States department of agriculture from 1906 to 1908. In

1913 he went to the zoological station at Naples, Italy, to investigate problems in plant physiology. He spent the next year in Strassburg, Germany, pursuing investigations in physiological chemistry under Hoffmeister.

"Among the 60 or more scientific papers which Professor Reed has published are numerous contributions to knowledge and to successful agricultural practice in such subjects as the chemical problems of health and disease in plants, tomato blight, the club-root disease of the cabbage root, foliage diseases of the apple, factors which favor injury from spraying, the effect of fungi on maize, the enzyme activities involved in fruit diseases, the control of the cedar rust of apples, premature blossoming of the apple induced by black rot, and the planting and care of shade trees."

THE SUPPLY OF LEMONS

For the information of our members we have brought together the following data showing the supply of lemons in the United States for three five-year periods and the estimated supply for 1914-15. The years end on June 30.

Five-year average	Imports tons	California Shipments, tons	Total tons	Increase over last 5 years
1900-1904....	78,750	28,620	107,370	...
1905-1909....	74,531	52,963	127,494	18.8
1910-1914....	80,942	63,812	144,754	13.5
Year				
1914-1915....	80,803	76,086	156,889	8.4

The remark is sometimes made that the consumption of lemons has been nearly stationary during recent years. The data however shows that the 1914-15 estimated supply of 156,889 tons exceeded the average supply during the five years, 1900-1904, by 49,519 tons, or 46.1 per cent. This increase in the supply during about 15 years is equal to about 3300 carloads of 30,000 pounds each.

The proportion out of the total supply which was shipped from California increased from 26.7 per cent in 1900-1904 to 48.5 per cent in 1914-15.—F. O. Wallschlaeger, Secretary Citrus Protective League.

A MAGNIFICENT AVOCADO

We recently saw a 29-ounce specimen of the Spinks avocado, one of the handsomest pieces of fruit we have ever seen. Nor is it the largest this particular tree has produced this season for Dr. Spinks informs us he has picked one which tipped the scales at 37½ ounces, the seed of which weighed three ounces. As the fruit is rather thick-skinned he thinks the skin may perhaps have weighed as much more, but this would leave over 30 ounces of edible fruit. There are almost hundreds of varieties of avocados, both good and indifferent, perhaps more unknown. It will require a few years to test them out as to quality, capacity of tree, vigor, resistance, and other points. Ultimately California will be growing great quantities of this magnificent fruit of the best varieties.

Many people send boxes of oranges east for Christmas and many more would send were the express not so high. It seems to me that the Exchanges could arrange to have Christmas cars go east at certain dates to central distributing points to be shipped from there by express. Many attractive boxes could be made up containing varied California fruits and some pretty California souvenir telling the charms of the state. If the quality of the fruit could be relied upon and advertised they might receive many Christmas orders from the East.

I believe they could add quite a little to the consumption of their fruit besides establishing the California fruit habit, the sentiment adding considerably to the advertising value.—M. Melson Moore, Lindsay.

Irrigation

Forestry

WHAT IS DRY FARMING?

By F. W. Mondell in Dry Farming and Rural Homes

THE term dry farming is applied to certain principles and practices in agriculture the purpose and effect of which are to make possible and profitable the growing of crops without irrigation in regions where, owing to the limited amount and unfavorable occurrence of periods of precipitation, it is difficult or impossible to conduct agricultural operations profitably under the ordinary or customary methods practiced in regions of ample or excessive rainfall and humidity.

The practical application of these principles and practices, while absolutely essential to uniformly successful crop growing in regions where the nominal precipitation is quite limited or which are subject to periods of drouth during the growing season, are also useful and helpful in all regions where the precipitation is not uniformly abundant.

These methods produce valuable results when applied to lands which have become exhausted through continuous croppings without proper fertilizing. They are also highly beneficial in the practice of agriculture by irrigation where the water supply is limited and must be carefully conserved. In a broad and general way the application of the scientific and thorough methods of farming embraced under the general term of dry farming are of very great advantage to the farmers under any climatic conditions under which agriculture is practiced either with or without the use of artificial irrigation.

Dry farming methods embrace a wide variety of practices all tending to the conservation of moisture and soil fertility and vary in their application according to the circumstances and conditions under which applied. While these practices conserve the moisture they also tend to prevent loss and destruction from excessive rainfall or the application of excessive volumes of water in irrigation. Deep plowing, subsoiling, frequent and thorough cultivation, particularly surface cultivation to prevent the formation of a surface crust, summer fallowing, and biennial cropping are among the methods employed to produce the desired results.

Those who have come to think of dry farming as merely a method to make possible the successful cultivation of considerable semiarid areas the world over, which but for these methods could not be profitably utilized under cultivation, should remember that while these are the conditions which have given birth to the modern dry farming movement, they are by no means the only conditions under which dry farming methods are applicable and highly beneficial. It should be remembered that there are few regions where agriculture is practiced under natural precipitation where occasional drouth is not experienced. Over large areas which have an annual precipitation which in the aggregate is ordinarily quite sufficient for growing of crops under ordinary methods, drouth during the growing season, or some part of it, is frequent and often disastrous. In all such regions, which in the aggregate include a major portion of the world's agricultural areas, the practice of dry farming methods, modified and adjusted to suit the conditions, are highly useful and beneficial.

The dry farming movement is therefore not only of interest to the people of the regions, extensive though they are, in many and widely separated parts of the earth's surface where precipitation is normally deficient, but to a marked and important degree to every region where the conservation or distribution of precipitated or applied waters and the valuable soil contents are matters of interest and con-

cern. As dry farming is in principle thorough and scientific farming, it is of vital interest, and the application of at least some of its methods are helpful wherever agriculture is practiced.

WELLS MORE THAN A MILE DEEP

The deepest well in the world is in Upper Silesia in the German empire. It is a diamond-drill hole in a coal field and is 7350 feet deep. A well in the United States which may go deeper, according to the United States geological survey, is four miles northwest of McDonald, Pennsylvania, and about 15 miles west of Pittsburgh. This well, which is being sunk to the Medina sandstone, a bed that elsewhere contains oil and gas, is now 7,174 feet deep. Some gas and oil were struck in the upper part of the well. Between

the depths of 6,830 and 7,100 feet rocks bearing rock salt and salt water were encountered. These are regarded as of Salina age, the same as those carrying rock salts in western New York. The temperature in this well at the depth of 6,775 feet, as recently determined with great accuracy, is 145.8 degrees Fahrenheit.

At Derrick City, McKean County, Pennsylvania, near Bradford, there is a well 5,820 feet deep, which is probably the second deepest well in the United States. Another deep well is on Slaughter Creek, Kanawha County, West Virginia; it is 5,559 feet deep. It penetrated a sandstone at 5,030 to 5,050 feet, and from this depth to the bottom, a distance of 545 feet, the well is in limestone. Near West Elizabeth, Pennsylvania, there is another well 5,575 feet beneath the surface, penetrating into the black shale. Another deep well is being drilled at Gaines, Pennsylvania. This has already reached a depth of 5,500 feet. Deep well drillers in this country of course employ the most improved and effective rigs, but one of the most remarkable of wells, reaching a depth of 3,600 feet, was drilled for petroleum in western China by means of such crude appliances as a

cable made of twisted strands of rattan.

The citrus field of California is widening every year. We note in the *Winters' Express* an item touching upon the planting this spring of 150 acres just north and west of that city. Oranges, lemons and grape fruit will be planted. Two large pumping plants have already been installed to deliver water to these lands. The trees have been secured from the Redlands district.

No man is born into the world whose work is not born with him, there is always work, And tools to work withal, for those who will, And blessed are the horny hands of toil.—Lowell.

What would you do if you hadn't a dream

Shining beyond like a star?

What would you do were it not for the gleam,

The brightness, the sweetness, the joy of that dream

Which beckons and guides from afar?

Goodyear Fortified Tires

Cost Users \$5,000,000 Less

This year's price reduction—made February 1st—was due to lower cost of materials and our larger output. It will save Goodyear users, judged by current output, about five million dollars this

year. And that, remember, was our third reduction in two years. The three total 45 per cent.

We cite these facts before we tell you of some added factory costs.

Goodyear Extras Cost Us \$1,635,000

Goodyear Fortified Tires embody many extras. That's why we call them Fortified.

Five of those extras are costly features found in no other tire. The rest are quality extras which few makers employ.

If we omitted them all, we could save on this year's probable output \$1,635,000. We could add that much to our profits. Yet Goodyear tires would appear to be just as good as now.

Users Would Pay

If we did that, Goodyear users would lose in tire wear many million dollars. For every extra we employ adds mileage and saves trouble.

There would be more rim-cuts, more blowouts, more loose treads. There would be less rubber, less fabric.

Yet five of those extras are used by Goodyear alone, and the rest are used by few.

This Year's Additions

This year's improvements—just our latest additions—will cost us \$500,000 this year. All to give you extra wear. And we shall spend \$100,000 on research this year to find more improvements for next year.

Think of these things—you who buy tires blindly. Tires are not alike. But these differences are hidden. So tires may look like Goodyears and not be half so good.

Remember this: Goodyears won their place on service. It is the highest place in Tiredom. It is super-service, proved by millions of tires, that makes them outsell any other. And that super-service is due to these extras. Get them. Any dealer will supply you. (2421)

GOOD YEAR
AKRON, OHIO

Fortified Tires

Fortified Against
Rim-Cuts—by our No-Rim-Cut feature.
Blowouts—by our "On-Air" cure.
Loose Treads—by many rubber rivets.
Insecurity—by 126 braided piano wires.
Punctures and Skidding—by our double-thick "All-Weather" tread.

THE GOODYEAR TIRE & RUBBER COMPANY, AKRON, OHIO
Makers of Goodyear "Tire Saver" Accessories; also Goodyear "Wing" Carriage Tires and Other Types

Ideal Gopher Trap

Only Trap guaranteed to catch large or small gopher. Being round with thin edges gopher walks into trap before detecting anything in runway. Positive grip, jaws always hold. 100% efficient—catches gopher every time. Easiest to set. Far safer and surer than poisons or gas. Farmers say it's worth dozen other makes. Price 50c. If your dealer can't supply you, will be sent postpaid on receipt of 60c; two traps for \$1.10; six for \$5.00. Money back if not satisfied.

Fruits

POWDERY MILDEW OF APPLE

THE powdery mildew of the apple is due to the parasitic fungus, *Podosphaera leucotricha*, the vegetative body or mycelium of which develops as a coating of minute interlacing whitish filaments on the parts of the plants attacked.

The fungus produces two spore stages in its life history; the conidial or summer spores which are produced throughout the growing season and give to affected parts a whitish powdery appearance; the ascigerous stage, which gives rise to the ascospores. The latter is produced only upon the twigs, and the bodies bearing the ascospores may be found buried in the dark felted mycelial mass towards the end of the growing season. The conidia serve to spread the fungus during the growing season. It is apparent that the fungus is carried over the winter by mycelium which hibernates in the buds and also by the ascospores. The part which the latter play in the life history of the fungus is somewhat problematical.

The mildew confines its attacks in the main to young shoots and blossom clusters. Both stem and leaves of shoots may be affected and either killed, deformed, or reduced in size and vigor. Blossom clusters may be blighted and young fruits may be affected later than at the blossoming period. The mildew is now on the fruits of pear also. The amount of blighting of blossoms varies in different localities. Secondary infections may occur on mature leaves to a limited extent.

Control

The control of the disease calls for the employment of two methods, pruning and application of fungicides. In light attacks of mildew it seems probable that pruning alone will suffice, while in orchards where the disease has gained considerable headway, spraying must be resorted to in addition to the pruning.

Pruning

It is known that infested buds on badly mildewed shoots produce seriously diseased shoots the following spring. Spraying will not prevent these infections, so the affected shoots should be removed and destroyed by burning. This may be done at any time consistent with horticultural practice and if not done earlier should be made a part of the regular dormant pruning operations. If mildew is serious it will be advisable to prune out more brush than ordinary to stimulate the growth the following season. In general the pruning practice should aim to eliminate close interlacing of branches, and vigorous shoots of the current year's growth should be cut back one-third to one-half.

Spraying

The time of application of the spray may be given first consideration. It has been demonstrated that winter spraying is without effect on mildew in California. It has not yet been determined whether this holds for Washington conditions or not, but it is probable that such will be the case. The times of spraying to be recommended are as follows:

Just after the petals fall.

In connection with the second spraying for codling moth or earlier if the mildew is serious.

Three or four weeks after the second spraying. It may be necessary to spray a fourth time after a like interval if mildew is serious and conditions continue favorable.

The selection of the fungicide is a matter of considerable importance and should depend in part at least upon what other diseases are present in an orchard. In some sections powdery mildew is the only fungous disease of apples that is present, but in others the orchard must be protected from scab also. In case scab is present the regular lime-sulphur treatment (1-30)

for this disease should prove of value in the control of mildew. The number of sprayings for scab will vary according to conditions and the severity of the disease. Those most generally recommended are as follows:

Just as the blossom buds separate and show pink.

Just after the petals fall.

Ten days to two weeks later.

Experience will show whether the first only, or all of these applications, are necessary. If the mildew is bad additional sprayings may be necessary for this disease alone, and in this case it may be advisable to employ one of the sulphur sprays recommended below.

If powdery mildew is the only disease for which protection is sought one of the following fungicides may be used:

Atomic sulphur or some other finely divided form of sulphur. Atomic sulphur may be used at the rate of 2-6 pounds to each 50 gallons of water. It seems probable that the minimum strength recommended will give as effective protection as the more concentrated solutions.

The iron-sulphide mixture. The rather laborious method described in the United States Department of Agriculture Bulletin 120, 15-16, does not seem to be necessary, at least for the drier sections. The modified Ballard formula is as follows:

Iron sulphate (copperas), 4 pounds.
Lime-sulphur, 33 degrees Baume, 1 gallon.

Water, 200 gallons.

A stock solution of the iron sulphate should be made and one pound to the gallon is a convenient strength.

Fill the sprayer tank, start the agitator, add the lime-sulphur and slowly add the requisite amount of iron sulphate solution. In order to insure complete precipitation of the iron-sulphide a slight excess of lime-sulphur may be used.

The necessary insecticides like black-leaf 40 or lead arsenate may be added to either the atomic sulphur or the iron sulphide mixture.—Agricultural Experiment Station, Pullman, Washington.

CALIFORNIA PEACH BLIGHT

Calling attention to the rapid spread of what they term California peach blight the faculty of the Washington Agricultural College sends out to fruit growers of that state the following regarding the disease and its treatment.

The disease causes a twig and bud blight, a spotting or shot-hole effect on the foliage, and a characteristic fruit spot. Peaches and apricots are most seriously affected, but what appears to be the same disease attacks cherries and plums.

The disease on twigs manifests itself by the appearance of small brown spots with darker border, located on the current year's growth. These may be adjacent to buds or scattered and few in number or sufficiently numerous to coalesce and kill the shoot. At other times a single lesion may spread until the twig is girdled. One of the serious phases of the disease is the invasion of the buds and their consequent death. There may be more or less exudation of gum from the twig lesions or the blighted buds. Since the fruit buds are produced on the one-year-old wood this form of the disease may either reduce or entirely prevent the production of fruit.

The extent to which the disease attacks the leaves varies with varieties and the severity of the disease, but if twigs are affected there will be more or less spotting of the foliage, followed

by the dropping out of the affected tissue, thus producing the shot-hole effect. The spots may be few in number and small or they may be so numerous as to coalesce and form more extended dead areas. Young affected spots show as either red or brown areas, which vary in size from one-sixteenth to one-fourth inch in diameter or sometimes more. In older spots a brown dead area is generally surrounded by a border of red or dark purple, although in some cases the colored border may be lacking. In cases of light infections there may be little or no dropping of the matured leaves, but more serious attacks will cause more or less defoliation.

The trouble is most evident as a fruit disease upon the maturing crop, but delayed invasions of fruit buds may cause more or less dropping of young fruits. Fruits which escape these early attacks may be variously spotted or deformed by later infections. On the peach and apricot the spots are at first small and generally of a reddish purple color. This color character appears to be less constant on the cherry. With the advance of the disease the spots increase in size and the center shows a lighter color which later changes to a dark brown or almost black in some cases. The spots may be few in number or sufficiently numerous to coalesce and form extended dead areas or even involve the entire surface of a fruit. There may be cracking of the seriously infected fruits accompanied by more or less exudation of gum, and badly diseased specimens may be shed before reaching maturity.

The blight is caused by a parasitic fungus known as *Coryneum beijerinckii*. It produces its spores or reproductive bodies in large numbers on minute dark or blackish pustules barely visible to the naked eye on the stem lesions or on the fruit spots. The spore-producing pustules are much less frequent on the leaf spots and in many cases the affected tissue drops out before any spores are produced. No other stage in the life history of the causal organisms is known, although it seems probable that a winter spore-form may be produced on fallen leaves and fruits.

Spraying is the only effective means of control. Special attention should, however, be given to the removal of blighted shoots in the regular pruning operations. It has been found possible to control the disease in California by a single fall spraying with Bordeaux, but in Oregon spring spraying in addition has been found necessary. Although no experiments have yet been carried out in Washington, it seems probable that spring treatment will be necessary under our conditions also.

The following spraying program is offered for trial:

Bordeaux 6-6-50 formula about November 1, or as soon after the late fruit has been picked as possible. In this spraying special attention should be given to secure a thorough drenching of the younger twigs and branches. In case the disease is severe the following additional applications should be made:

Spray two or three weeks after the petals fall.

Repeat the application after an interval of two to three weeks.

If rainy weather favorable to the disease continues a third application of the fungicide should be made. The number of sprayings and the intervals between them should be governed by the frequency of rains and the severity of the disease.

For the spring sprayings several different fungicides are available: Lime-sulphur 1-40 or 50. Bordeaux 2-4-50, or self-boiled lime sulphur 8-8-50. The commercial lime-sulphur and Bordeaux cause more or less burning under certain weather conditions, especially on peaches and apricots. The self-boiled lime-sulphur is suggested for use on account of its less injurious effect on peaches. Its fungicidal value is satisfactory, but the work of preparing it is greater, so it is only recommended for use if the other mixtures prove too injurious.

CONTROLLING THE APPLE BORER

"Worming" and painting the trunks of the trees are recommended to owners of apple orchards as efficient methods of dealing with the roundheaded apple tree borer in a new Farmers' Bulletin, No. 675, of the United States department of agriculture. A heavy application of some paint that will not injure the trees but will remain in an unbroken coat on the bark for two or three months, is effective in preventing the female from laying her eggs in the tree, and greatly reduces the amount of worming, or the removal of the insects with a knife and wire, that must be done.

The roundheaded apple tree borer, the most destructive of a number of similar pests, lays its eggs in or under the bark of apple trees. After hatching the larvae feed upon the inner bark and wood to such an extent that the tree is seriously weakened or killed. The pest is found over the whole of the eastern portion of the United States and as far west as Nebraska, Kansas and New Mexico. In addition to fruit trees, it feeds on service, wild crab and mountain ash trees, which makes it advisable for orchardists to remove these varieties for a distance of at least a hundred yards from their orchard.

The female lays her eggs, one at a time, in an incision she has made in the bark, usually just above the surface of the ground. About 15 or 20 days later the eggs hatch and the larvae appear. When full grown they are nearly an inch and a half in length. They first attack the inner bark, eating out broad, more or less circular galleries and thrusting out through small holes in the bark castings which form little heaps of reddish wood fragments around the base of the tree. During the winter the borers are quiescent but early in the following spring they attack the solid wood, while some of them work their way up the trunk. These last spend one more winter in the tree and then, having passed through the pupal stage, dig their way out and emerge as adult beetles. Three years are required for the insect to complete its development from egg to adult.

Ordinarily, the beetle lives about 40 or 50 days. It is about three-fourths of an inch in length, light brown in color above, with two broad white bands, joined in front, extending the full length of the back; the underparts and front of the head are white. The females rarely fly any considerable distance, so that if the immediate vicinity of an orchard can be kept free from them, there is little danger of a serious infestation.

The most common method of ridding an orchard of these pests is to cut away the bark sufficiently to trace the burrows made by the borer. A hooked wire is then inserted into the burrow and the insect pulled out. If made with care, the wound in the tree caused by this process will heal readily. The castings at the base of the tree serve as an indication of the presence of the borers. Where the burrows are curved or obstructed in some way so that the wire can not be inserted, cotton batting dipped in carbon bisulphid should be inserted and the hole then plugged with moist earth. The gas from the carbon bisulphid will penetrate all parts of the burrow and kill the borer.

In addition to worming, as this process is called, paint is often used to prevent the beetles laying their eggs.

Pure white lead and raw linseed oil, mixed rather thick, will not injure the trees, and when applied to young, smooth bark, will form a protective coat during the egg laying season. It is probable that this is a more effective method than wrapping the trees with building paper, cotton batting, cloth or other materials sometimes used for this purpose. Before painting,

widespread interest in the search for an available source of potash in this country and the apparently promising prospects this locality affords of a considerable commercial production in the near future. The estimate made three years ago that this deposit contains 4,000,000 tons of water-soluble potash salts seems to have been amply confirmed by subsequent develop-

promising immediate source of commercial potash in the United States.

The business man pays special attention to certain fundamental problems. These are: To reduce the cost of producing his product, whatever it may be; to increase the quantity and the quality of the product which is produced at a given cost; to increase the net selling price of the thing which is produced. Community breeding is one of the greatest possible factors in solving all three of these major problems. It enables the individual farmer to have the use of high grade, expensive breeding animals at a less cost than he could if he were operating independently of his fellow farmers—thus reducing his cost of operations or production.

The higher quality of product, combined with cooperative methods of marketing animals and their products which are used among community breeders, increases the net price which the farmer receives.

Two Sprays Working on Large Trees in San Jose Park. The Factory Was Recently Partially Destroyed by Fire.

however, the earth should be removed from the base of the tree for a depth of from three to four inches. The surface of the trunk thus exposed should be first scraped and painted and the earth then replaced. This is necessary, for the beetle occasionally lays her eggs under instead of above the ground.

THE GREAT CREST OF THE SIERRA

Mount Whitney, the highest point in the United States, is not an isolated mountain peak like Mount Shasta or Mount Rainier, but is the loftiest point in the great California crest or enormous saw-tooth ridge of the Sierra Nevada, including many eminences almost as high. Mount Whitney is 14,501 feet above sea level. Among those of slightly lesser height are Mount Russell, less than a mile distant, 14,190 feet; Mount Williamson, 14,384 feet; Mount Muir, 14,025 feet; Mount Langley, 14,042 feet; Mount Barnard, 14,003 feet, and Mount Tyndall, 14,025 feet. The most distant of these is less than 6 miles away.

By a strange freak of nature the lowest point of dry land in the United States is less than 80 miles from the highest. The lowest point is in Death Valley and is 276 feet below sea level. It is said that from this point Mount Whitney can be easily seen on a clear day.

POTASH IN CALIFORNIA

The salt-incrusted valley floor commonly known as Searles Lake, in southeastern California, has lately come into prominence through the

ments. That this amount of potash salts will actually be produced and placed on the market can not yet be considered assured, but so far as can be judged from evidence available it seems that this deposit is the most

GROWING OUR OWN PLANTS

Written for the California Cultivator
By Ernest Branton

AR in Europe has taught us many needed lessons in the field of horticulture, mainly on the supply and demand of ornamental and economic plants, the latter for the most part being those from which drugs, dyes, etc., are obtained. The products from the latter class came largely from Germany, but many of the ornamental plants were imported from Belgium exclusively; others from Holland. However, it makes little difference as to the source of supply; the vital question is: May we not produce them as cheaply and of as good quality here, not only in this country but in California?

It is folly to assert that California cannot produce all of them, for we have every variation of climate known to Europe. The cost of production is

Begonias

Begonias are among our very choicest garden plants and all should have a few in shaded or shady corners and other places protected from harsh winds, for the common fibrous rooted sorts thrive under the most ordinary garden treatment.

Begonias are comparatively new plants as we know them, and it is doubtful if Linnaeus, the father of botany, ever saw one. For it was not until the thirteenth edition of his great work that he included some meager descriptions by Plumier, and these are of no value in dealing with the plants today. Nothing of much value in the literature of begonias appeared until a half century ago, since which time thousands of fine hybrids have been distributed in the plant markets of the world. While some care and attention must be given the Rex or large-

School Gardens

the most serious problem, for the American workman is paid more than his European brother. To offset this point we produce some plants that are much superior to those from any part of Europe and are therefore able to command higher prices. In the Santa Cruz section the so-called Dutch or Holland bulbs are being successfully and profitably grown, and many sorts remain untried that will ultimately become staple crops. All over the Pacific coast states drug and dye plants may easily be grown with every assurance of abundant yield; the only question is the cost of harvesting and also of manufacturing the commercial commodity. Among the most serious shortages in ornamentals is in the usual importations of azaleas.

California, Oregon, and Washington each contain many beautiful native species whose climatic requirements are similar to those of the commercial varieties. Why may not we produce at least enough for home use? We also have native rhododendrons, and these are often hard to distinguish from azaleas, also requiring similar conditions and treatment. Then we have many substitutes, such as heaths, poinsettias, chorisemas, hydrangeas, and a host of fine deciduous flowering shrubs that may well replace azaleas. There is no question but the small rancher, the truck grower and the berry grower may produce many of these plants at a profit, wholesaling them to leading nurserymen. This state contains thousands of ranchers who grow and sell to nurserymen asparagus and berry roots and vines, etc., and why not ornamentals? No greater skill and no additional equipment is necessary. Nearly all the plants needed may be grown from cuttings. The subject is worthy of serious consideration on the part of all who are wondering what best to grow on the small home place.

leaved section, and the tuberous sorts, the common ones are very easy to grow.

Our Native Oaks

The oaks of California are variable when considered as a family, and nearly all are beautiful; certainly all are interesting. Why may not plant lovers call together the full collection on the home place? Why leave such work for park superintendents who never will do what is most necessary to awaken and hold interest in our wondrous native vegetation? Out in the rural districts among the oaks are to be found proper surroundings for collection of oaks, and such gathering of fine native material need not be confined to oaks. California has hundreds of species of native plants in demand wherever plants are grown. Grow them in the garden and also collect for sale seeds and plants that grow in your particular locality.

The Curious Cacti

There is no cactus but has a curious form, and if one but starts to make a collection the lure of the curious takes firm hold, and soon the victim has what is known as the cactus craze. But nowhere in the vegetable kingdom, not excepting even the orchids, is it possible to find at once so many curious forms and beautiful flowers. In size they range from an inch to 60 feet high and from the slenderness of a pencil to the thickness of a barrel. The flowers have as great a range of colors and shades as may be found in any family in a wild state; and in this respect few approach it. Every person owning a garden should have a few plants, and if you love not the spiny pincushions grow some of the climbers or the leaf-cactus, known as phyllocactus, for the latter are practically thornless and vie with the orchids and water lilies in beauty of blossom.

DO AMERICANS LOVE FLOWERS?

N Eastern exchange claims that Americans do not love flowers, because they are used among the rich and fashionable in reckless profusion for display rather than enjoyment. It is also claimed that we are not a flower-loving people because we accept botanical appellations for our indigenous plants instead of giving them simple, homely names like the charming ones with which familiar flowers have been christened in older countries.

To this another answers that what ostentatious dwellers in towns are guilty of is by no means to be accepted as a national trait. The place to study the characteristics of a people is not among the very rich, but among those in moderate circumstances who make up the bulk of the inhabitants.

Any one who has driven through New England or the older middle states cannot doubt that there, at least, the people truly love their gardens, and the house plants with which their windows in winter are stocked. Even the humblest dwelling has its row of flower pots, or tin cans, well filled with slips of geranium or other bright flowers; and the hours spent over their gardens by gentlewomen who cannot afford a gardener are the best proof that the affection they have for them is a real and ardent one. We have known many a house mother, burdened with domestic cares, to rise be-

fore day to snatch an hour for weeding or watering her little border that its fragrant contents might be of avail for a friendly gift or an adornment for her own table. It is the rarest thing in a New England village to enter a room in summer and find no flowers disposed about it; and in the winter the eager question, "How are your plants prospering?" often comes before the conventional inquiries after the health of the members of the household. Their new varieties are discussed and exchanged; there are rare chrysanthemums to talk about in autumn and choice tulips and hyacinths to be complimented in the spring, and each one knows what her neighbor's garden is most famous for and who is the most successful in her general management of her pets.

Many women are experienced botanists in their own locality and can tell where every wild flower of the region is to be found. They rejoice too in the discovery of a new weed with as much enthusiasm as an astronomer shows over a fresh comet. Most of the men who live in the country are too busy to give much time to flower gardens, but they show great interest and pride in those so carefully tended by their wives and daughters and are ready enough to lend a helping hand, even though they may pretend to begrudge the space taken from grass or vegetables for what they think it their duty to call an idle diversion. But given a retired merchant with not much to occupy his mind, and the chances are that he will soon be wearing himself out in loving labor among his rhododendrons and roses, taking pride in having the earliest and largest blossoms in his parterre and conferring in a friendly way over the fence with his neighbors who stop to consult with him on the best way of dealing with insect pests.

As to the nomenclature there is this to be said: In older countries the people

(Continued on Page 95)

Bees

and

Their Care

OLD COMB

LD combs cut out from the bottom of the brood-chamber might not contain more than ten percent of beeswax.

Usually the honey in them has been taken out by the apiarist or robbed out by the bees. But at times such combs contain a large amount of pollen which is only dead matter when comes the rendering into wax. The upper part of the combs is always richer in beeswax because it is reinforced every year with new wax at the time of the honey harvest. This is readily proven when we see the bees whitening their combs, which is simply adding new wax. In a similar way the extracting combs are every season strengthened so that they become tougher and tougher, even though no brood is reared in them. Even the section boxes have their combs reinforced when they are used the second season after a failure to fill them and seal them fully the first year.

The lighter the combs, the greater the percent of pure wax in them; such combs as have been used only one or two seasons, if clean, might contain 90 to 95 percent of beeswax.

Owing to these facts and the irregularity of old combs it is impossible to answer the question of how much old combs are worth per pound, especially as the beeswax which they contain has itself a fluctuating value. However we can say that brood combs of Langstroth size contain from three to five ounces of wax in ordinary circumstances. When the value of beeswax is known it only remains to figure the expense of extracting it to reach the value of the combs.

The older the combs of the brood-chamber, the more cocoons they contain and the more difficult it is to extract the wax, as more of it will be absorbed by the residues than in new combs or in super combs, containing mainly beeswax.

Much of the wax rendered at the beekeeper's home is only partly secured from the slumgum, owing to the lack of proper devices or because too little time is taken. The methods used by some apiarists are so crude that I have often heard old beekeepers say that no wax can be obtained from black combs. This is true when the work is attempted with a solar extractor. We are steadily coming to the European custom of leaving to specialists the rendering of the wax from the combs, with profit to all concerned. —American Bee Journal.

BEE NOTES

Ample room should be given in the supers to take care of the surplus, and likewise cut down swarming. Where the ordinary ten-frame hive is used the best preventive is the "shook swarm" plan.

Too much emphasis cannot be put upon the necessity of using full sheets of foundation in the section boxes when comb-honey is being produced, as it not only entices the bees into the section supers much more quickly than when mere starters are used, but it insures the building of straighter and more perfect combs, important factors in the salability of the combs.

The frames of comb used in producing extracted honey should have the combs securely wired in to prevent their breaking down when being swirled around in the extractor.

An excellent plan is to go over every colony and clip the wings of every laying queen, as this will prevent the loss of the swarm in case it emerges in your absence.

If you are at hand when the swarm emerges, it will be an easy matter to find the queen hopping around in the grass in front of the hive, even though the swarm may leave, and she can be returned to the hive and will be there when the swarm returns in quest of her.

The old hive that has been moved should for a few days have its entrance contracted to prevent robber bees making ravages, and in a few days it should have a young queen from one of its queen cells built before the swarm came forth; and once she is laying and enough bees have hatched from the sealed brood, the entrance can be enlarged.

In any case, the supers containing the sections should be taken from the old hive and set over the new hive, as the working force is with the swarm and will finish the combs more quickly than if left with the old hive.

In producing extracted honey, have queen-excluding boards between the brood chamber and the surplus chamber, to prevent the queen laying in the super frames, as it is an annoyance to have unsealed brood in the frames from which the honey is to be extracted.

No queen excluders will be needed when producing comb honey. —Farm Journal.

NORMAL PRODUCTION OF HIVE

An inquirer has asked as to how much a good colony of bees should produce in a year. Perhaps 70 or 80 pounds would be a good season's work under average conditions. They have been known to produce anywhere from 100 to 240 pounds in an excellent season. The same inquirer wishes to know as to the selling price of a colony of bees. That depends much upon the period of the year. Sometimes at the beginning of a flow a colony would command a much better price than at this time of the year after the season's work is done. However, a fair average price for a colony of bees is about five dollars.

Queries

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Tanning Rabbit Skins.

How can I tan rabbit skins?—Subscriber, Manteca.

To prepare skins for making ladies boas, muffs, capes, etc., take the skin off whole by cutting from hock joint across vent to hock joint on opposite side and draw the pelt off over the head and cut off at a point back of ears; or, if the ears are to be left intact, let the cutting be done on a line extending around the point of nose. Then place the pelt on a stretcher made of half-inch board six inches wide at the top and four inches wide at the bottom. Cut this in two parts, from end to end. Stretch the pelt over the two, place edges together and rub salt over the pelt while fresh, and then sprinkle with powdered alum and allow it to dry. When about dry remove from boards and rub with the hands until dry. The skin will then be as soft and pliable as buckskin. Place your pelts where there will be plenty of fresh air, yet not in the direct rays of the sun.

Another method is to tack the skin taut, the fur side under, on a board, and after scraping the bits of fat off, moisten all over and sprinkle with a mixture of seven parts salt and one part pulverized alum. Leave about two days to absorb the salt. Then wet it again and repeat the mixture. About the fifth day wet it again and sprinkle with a mixture of two parts alum and one part

salt. When dry it is cured and can be taken off the board. The above is from the Belgian Hare Guide.

Grafting Myrobalan

I have a plum tree which died above graft but has made a sturdy six-foot high tree from the Myrobalan root. Would the fruit be good to eat or preserve or should I graft tree?—Subscriber, Glenn.

The fruit of the Myrobalan plum is sometimes used for preserves but has not much flavor. This variety is very easily grafted and this is the best and most satisfactory thing to do. If grafted to some of Burbank's new Japanese varieties you will get some fruit the following year.—J. W. W.

Paralysis

About a month ago young rabbits running loose seemed to lose the use of their hind legs. Some of them have been so seriously affected that they could not stand.—Subscriber, Napa.

We quote from "Practical Rabbit Keeping" regarding paralysis which we presume is the cause of this trouble. "Paralysis is mostly met with in rabbits under six months of age and is probably the most difficult disease of all to cure. It is gen-

Economics

on the Farm

"LOAFERS."

By I. D. O'Donnell, Supervisor of Irrigation.

ASK the average farmer who does the loafing on his farm and he will say, "The hired man." With many farmers the terms "hired man" and "loafer" are synonymous. I have known farmers to work themselves into chronic cases of dyspepsia because the hired man was a little tardy; if the farm didn't pay, it was because the hired man didn't hustle.

The object of this short article is not to discuss the merits or demerits of the hired man. My own experience would lead me to say a good word for the hired man. It is my purpose to point out to the farmer that only a small per cent of the loafing on the farm is done by the hired man, and that the farmer should prod along all the loafers and not devote his entire time to the hired man, who probably needs a rest.

Now, Mr. Farmer, you may not have any loafers on your farm, so let us take a look over your neighbor's place. The soil in his fields looks as if it has been poorly cultivated, and you tell me it is that way every year. He does a poor job of plowing, a worse job of making a seed bed, puts the seed in any old way, and then runs on three times too much irrigation water thinking that lots of water will make up for poor cultivation. The result is the soil on the whole farm is loafing—has not worked enough to produce a good crop in years. When people get in that condition the doctors pronounce it a case of hookworm, caused by that overworked parasite. The only cure for this soil is plenty of air and exercise and the right kind of food; this means thorough cultivation and fertilization.

Now take a look at those farm laterals. You say you can irrigate 40 acres in half the time required by your neighbor, and we both know it is because his farm laterals are loafing. In the first place they are never where he needs them and they are so crooked and choked with weeds that water has a hard time struggling through. It is poor policy to pay a hired man to work a farm irrigation system like that; half the hired man's pay is wasted and a poor job of irrigation is the best that can be expected.

Next we will take a look at the dairy cows. Just as we expected — gives them about as much care as a burro expects. I don't blame old Brindle for loafing. She is not a real milch cow anyway. I guess your neighbor will conclude "dairying don't pay," and he does not realize that it is because he does not know the difference between real dairy cows and boarders. Of course it takes more than good cows to make a dairy farm. Cows don't do all the loafing on dairy farms that fail.

Now we come to the pigpen—a number of perfectly hungry hogs loafing around in a dry pen waiting for their feed to be brought to them. If your neighbor had the good of those hogs at heart he would have them out moving around, gathering their food where there is plenty of it. You can't expect much from hogs that loaf around in a dry pen. Of course hogs can not exercise and gather food unless a range is provided for them. It must have been an oversight on the part of our neighbor in leaving the hogs shut up in that pen.

We might go on through all the other departments of the farm and find a lot of chronic loafing. For example, we might find that all the fruit trees, because of lack of a little intelligent pruning and spraying, are loafing on the job—just producing a small quantity of cull fruit and breeding orchard pests. We might find that most of the chickens on the place are just beef type and don't seem to realize they are expected to produce an occasional egg. Of course it is hard work to eliminate all the loafing on the farm,

but it is the farmer who comes nearest to eliminating loafing in all departments who succeeds.

Then there is this about the hired man: I have noticed it is almost a habit with hired men and other men to be most efficient on the most successful farms. Seems as if they take an interest in a proposition that is successful, just as you take an interest in driving a good horse and a good automobile. If you can just keep your soil, your irrigation system, your live stock, and all other departments of your farm from loafing, you won't need to worry about the hired man.

THE BEST RECEIPT

The best receipt in the world by which to prove the payment of a sum of money is the canceled check by which it was paid, bearing the signature of the man to whom it was made out. This is a proof in a court of law that the payee has received the money called for on the face of the check. Such receipts should form a part of the farm records of every man engaged in the farming business.

There is no condition to justify one in doing his business in a slipshod manner. On the other hand there is every condition or reason in the world to justify his doing it in a business like manner; business should be done in a business way.

A check book is an easy and handy thing to carry; much more so than a bag of coin or a book of bills. If you lose the checkbook the finder cannot get any value out of it, and you are not a loser thereby, for no one can get any of your money out of the bank without presenting a proper check for it signed with your name in your handwriting. If you lose the bag of coin or the book of bills the person who finds it can use its contents just as freely and fully as you can; the coin and the bills are legal tender to any one who has them regardless of whom they belong to by right.

The business farmer has learned to carry a check book rather than a purse, using the purse only for small change and incidental expenses. Regular accounts and large items are paid by checks rather than in cash. The men who have tried this method of doing business find that it is more satisfactory to themselves and to those with whom they are doing business, and at the same time it is really easier and better in every possible way.—Business Farmer.

THINGS WORTH REMEMBERING

That your neighbors are good people.

That good neighbors are the result of good neighbors.

That no community can rise higher than the average level of its people.

That discussion, publicity and education will raise the average level of any community.

That the strongest community in the state is the best organized one.—From a Minnesota Agricultural Extension Bulletin.

The bureau of agriculture of the Philippines is sending a demonstration train through the rice growing provinces. It is devoted almost entirely to rice propaganda. Special demonstrators and inspectors from the bureau accompany the car and give lectures to the people of the pueblos, illustrated by lantern slides. Emphasis is laid on the early-maturing varieties of rice, the proper care in seed selection, and the advantages of growing leguminous plants on the rice land to renew its fertility. The train also carries a display of irrigating machinery.

A shipment of 500,000 pounds of California butter was sent to Australia on July 10.

Small Fruits

Vegetables

SAN DIEGO COUNTY'S WINTER VEGETABLE UNION

Written for the California Cultivator
By George H. Wilson, Assistant
County Agent, San Diego.

VEGETABLE producers of San Diego County are organized and are now signing up acreage for the marketing of winter vegetables.

Conditions in San Diego County have been such that a market for vegetables was almost lacking. San Diego has not been able to consume them and the outside world has been closed to the grower. The region surrounding the Southern City of the Sun is blessed with such climatic conditions that vegetables can be grown throughout the winter season. This fact allows growers to supply the best trade of the northern and eastern markets. In order to develop the best markets the product must be limited in kind and variety so only the following will be included at present: Tomatoes, peas, cabbage, lettuce, rhubarb, peppers and celery. Others may be added from time to time as the membership sees fit.

The by-laws of the association have several features worthy of comment:

Every member must be a grower, allowing no antagonistic party a vote in the affairs of the organization.

By the provisions of "Section 7—Membership," a personal note is required. This is used as collateral to borrow money so no capital stock is required and also as a guarantee for the fulfillment of the agreement.

"At the time of uniting with the association and at the end of each year after the incorporation of the association, each member shall give a promissory note, payable on demand to the association. This note shall be for the sum of \$25 and an additional \$1.00 for each and every acre of crops, to be marketed through the association, then owned by the member. But in no case shall this note be for a less sum than \$30. When a new note is given the old one shall be canceled and returned to the maker.

"These notes shall be the property of the association and shall be used by the directors as collateral security with which to borrow needed money for the association's business. Whenever these notes are deposited as security for a loan, all of the members shall individually share the liability in proportion to the face value of their respective notes.

"Each member shall pay a membership fee of \$5.00."

Section 9, Clause 2 is the solution of the downfall of many cooperative organizations. "In case any member is offered a price in excess of the price then obtained by the association, said member shall turn said bid over to the associations for filling from said member's goods."

Thus if an antagonistic commission man or other party tries to break up the organization by overbidding, until the organization is disrupted, the bid will be accepted but used to strengthen rather than weaken the organization. The opponent cannot long follow this practice.

Section 9, Clause 3. Each member shall have a number or mark permanently stamped on every package. Thus any losses from the quality of fruit or packing can be traced to the cause and one producer will not have to stand the losses of a poorer producer. It also allows the manager to aid the poorer grower through showing him how to offer a first-class article.

Section 9, Clause 4. Each member shall have one vote and one vote only. No ring can control the organization, so it must remain distinctly cooperative.

Meetings were held during the last week at Chula Vista, Spring Valley, Nestor and Otay, at which the growers discussed all phases of the project and those who wished to come under the

protection of the association signed up their acreage.

At a meeting held in San Diego July 8 a Board of Directors was elected from which the officers and directors were chosen as follows: H. Culbertson, El Cajon, president; W. R. Edwards, Chula Vista, vice-president; J. R. Blakeston, La Mesa, secretary; First National Bank of San Diego, treasurer; J. R. Blakeston, La Mesa;

A NEW TOMATO ROT.

ANY carloads of Florida tomatoes have been injured or destroyed during the past few months by a "black rot" or "black speck" disease which has been more prevalent this season than heretofore, although known to have occurred in that state to some extent for three or four years. It is reported from some sections that the losses in the fields amounted to 50 per cent and that some large fields were so completely infected as to be almost worthless. In addition to the field losses, tomatoes packed and shipped in an apparently sound condition develop the rot in transit and

though under certain conditions it may attack potatoes. It occurs in the fields, causing black specks on the leaves, stems and fruit. The fruit spots enlarge and become very black, with pin-point-like pustules filled with spores. Both green and ripe tomatoes are affected, most of the spots usually appearing at the stem end. An important point brought out by this study is that the fungus seems to be unable to attack unmutated fruit. Some injury, either by insects, bruises, or natural cracks, must be present to permit infection. It is probable that in many instances where there is little or no field infection the tomatoes become injured during harvesting or packing and are infected in the packing houses. It is likely that by more careful handling and the prompt destruction of all infected material the loss during shipment can be reduced. The disease will

Cultivating with Planet Horse Hoe.

Walter Sharpe, Otay; J. Haughamont, La Mesa Heights; N. Culbertson, El Cajon; J. S. Scott, El Cajon; J. W. Tucker, Nestor; W. R. Edwards, Chula Vista.

Saturday, July 24, in the chamber of commerce at San Diego at 1 p. m. will be held a business meeting of all members of the association, at which time a permanent board of directors will be elected and business will be transacted.

Wishing to aid all such projects which it feels are worthy the department of agriculture in cooperation with the agricultural college has sent G. H. Wilson to act as an assistant to Mr. Weinland, the farm adviser, and to devote all of his energy to aid the growers in organizing themselves for cooperative marketing.

reach their destination in such condition that they can not be sold as first-class stock. A Denver commission house writes that practically every car that has arrived in Denver this year has shown this disease to quite an extent. The Canadian government inspector reports cars arriving there quite ruined.

The department of agriculture has completed and published a technical study of this trouble, extending over three years. It finds that the disease, which will be called the Phoma rot, is new and not to be confused with other tomato rots. The fungus causing it is a parasite belonging to a genus which includes several serious fruit and tuber rots and stem blights of other crops, but this particular species appears to occur mainly on tomatoes,

not develop at a temperature of 44 Fahrenheit, or lower.

Receipts for tolls on vessels passing through the Panama Canal during the month of April amounted to \$442,415, or \$84,112 more than the cost of operation and maintenance, not counting interest on capital investments. April was the first month in which the receipts exceeded the charges.

The Peruvian government has entered into arrangements to put water on a great area of coast lands which will later be sold to colonists on 20 years' payment.

A campaign for members for the newly organized apple distributors is being pushed vigorously.

Entered at the Post Office at Los An-
geles, California, as Second-Class Matter.**Thursday, July 22, 1915****OUR ADVERTISERS RELIABLE**We guarantee our subscribers against
loss through dishonesty of any adver-
tiser in the Cultivator. We do not at-
tempt, however, to adjust trifling differ-
ences between subscribers and honest,
responsible advertisers, nor will we pay
the debts of honest bankrupts. Notice
of complaint must be sent us within 30
days from date of the transaction, and
the subscriber must have mentioned the
Cultivator when writing the advertiser.**FOREST LANDS**The forest service of the depart-
ment of agriculture announces that
the president has signed a proclama-
tion eliminating something over 150,-
000 acres of land from the Sequoia
national forest and some 85,000 acres
from the Santa Barbara national forest.
These lands have been found valuable
for agricultural purposes and not re-
quired for reforestation or protecting
the watersheds. Some of these lands
were filed upon prior to their being
included in the forest reserve and
have been in use for agricultural pur-
poses for some time.**MORE COW TESTING**Mr. Rhoades of the California
Milk Producers Association writes
that there is a movement now on
among its members in connection with
an official of the state dairy bureau to
organize an official cow testing associa-
tion within the membership of the
Milk Producers Association. We may
add that this Producers Association
has been recently organized and Mr.
D. M. Herrin is now secretary and
manager. There are now testing as-
sociations operating near Ontario and
Chino. These have proven so profit-
able to every dairyman who has fol-
lowed up the lessons taught by them
that their usefulness will extend.**FRUIT GROWERS REPORT**The proceedings of the 45th
State Fruit Growers Convention which
was held in Los Angeles last Novem-
ber is now being mailed by State
Horticultural Commissioner Cook to
all who registered at that conven-
tion. For the first time these books
are issued through the efforts of pri-
vate parties, the funds for their pub-
lishing being secured through adver-tisements which appear both before
and after the convention reports. The
report is well printed and has a valu-
able fund of information. Those who
did not attend the Los Angeles con-
vention should write to State Com-
missioner Cook at Sacramento for a
copy.**FIGHTING THE PESTS**The board of supervisors of
Butte County has decided to take up
the fight against the yellow star this-
tle which is becoming a serious pest
in portions of that county. This this-
tle is an annual and its cutting at this
period of the year prevents the ripen-
ing of the seeds and the increase of
infested territory another year. Com-
missioner Mills has been instructed to
make a persistent and immediate
fight. We understand he is already
serving notices upon all property hold-
ers whose lands are infested with this
pest. Mr. Mills thinks that three
years persistent campaign will rid the
county entirely of it.**GROWERS IN CONVENTION**The final arrangements for the
46th State Fruit Growers Convention
are made and everything is ready for
the gathering next Monday morning.
The convention proper does not begin
until Tuesday evening, but with the
potato growers, the county horticul-
tural commissioners and others meet-
ing on the two days preceding, it will
be a full week of fruit growers work.
It will be a great convention for there
is a fine offering of talent on the pro-
gram arranged by State Horticultural
Commissioner Cook. The last day,
Saturday the 13th, will be spent on the
exposition grounds, and on Saturday
evening in Festival Hall, addresses
will be given by Prof. John M. Coulter
of the University of Chicago and Prof.
J. G. Lipman, director of the New Jer-
sey experiment station.**AGRICULTURAL FEDERATION**Chairman Van Norman of the
committee on organization of a state
federation of agriculturists has called
a meeting of his committee for the
afternoon of July 28 at Stanford Uni-
versity. This is in connection with
the State Fruit Growers Convention
which will be held in Palo Alto dur-
ing all of next week. Prof. Van Nor-
man has already outlined a constitu-
tion and by-laws for the proposed or-
ganization. It is possible the com-
mittee will materially revise this out-
line or even adopt an entirely differ-
ent plan, but in any case we believe
there is promise of a new organiza-
tion being formed. If it is and the
farmers take the interest in it that
they should we believe an organiza-
tion will be formed which will have
wide influence in bettering agricultural
conditions in the state.**ADVERTISING ARGENTINA**We have announcement from
Mr. Justo P. Zavalla who has written
articles appearing in former numbers
of the Cultivator and is in California
because of scholarships secured in
high schools of his state, San
Juan, Argentina, that he and other
honorary correspondents of the gov-
ernment of San Juan state are pre-
paring a tabulated report of the Amer-
ican industries represented at the ex-
position. This report is such as will
prove of interest to the agricultural
and industrial interests which are de-
veloping Argentina, and we doubt not
is principally to give information tothe people of that country. However,
Mr. Zavalla writes that anyone inter-
ested may address correspondence to
him or to the other correspondents,
care of the Argentine consulate, San
Francisco. The report referred to is
printed in Spanish.**FARM PACKING HOUSES**The department of agriculture
is issuing a circular giving informa-
tion as to the difficulties that will con-
front farmers in arranging for a series
of packing houses located in various
sections where livestock are produced.
The department gives warning of cer-
tain factors which cannot be disre-
garded if producers attempt to put
their own products into the hands of
the consumer. Especially is atten-
tion called to the difficulty of secur-
ing adequate supplies and the magni-
tude of operations which permits of
federal meat inspection, together with
the further question as to whether
farmers of a community are able and
willing to adjust themselves to the
conditions which will be required by
this movement. Until a demonstra-
tion has been satisfactorily made it
would seem advisable to defer the
matter of organizing a complicated
undertaking in the packing business.
In any case the careful observance of
the precautions enumerated cannot be
too strongly urged.**PATROLLING DIFFICULT**We note that the Butte and
Yuba County papers refer to the fact
that power companies seek to enjoin
rice growers from flooding their fields
because it makes difficult proper pa-
trolling and maintenance of transmis-
sion lines over them. These power
companies have been granted rights
of way over certain farms and natu-
rally this flooding makes almost im-
possible the reaching of some of their
towers.Perhaps they are entirely within
their rights in taking this stand, and
perhaps the farmer may be restrained
from the use of his own lands as he
may think proper, but we imagine this
situation will set him to thinking as
to the advisability of granting rights
of way to such concerns over his land.
The minute he does it he loses con-
trol of a certain extent of valuable
property. We need modern improve-
ments and must yield a bit in order
to secure them, but here is one proof
of the value of the long thought for
the farmer to see wherein he may be
signing away more than he intends.**MARKETING SYSTEM**Is our marketing system wrong?
We mean the general plan of handling
products from producer to consumer.
It certainly seems that there are too
many wheels within wheels and some
are persistent in the effort to have
the present system entirely upset. One
subscriber of the Cultivator who has
marketed hundreds of carloads of Cali-
fornia products writes: "Our present
marketing system is wrong in its
wastefulness and should be entirely
changed at once." "So long
as the growers of California continue
to market their products through
wrong channels of trade, just so long
will the wrong channels continue to
absorb by wasteful methods all the
growers profits." "What Cali-
fornia needs is distributing stations
in every town of 1000 inhabitants and
upwards, with several stations in the
larger cities."Possibly our subscriber is correct,
but certainly such an immense busi-
ness as that would call for armies of
skilled people and for generalship in
their handling. We urge California
producers to think seriously before
attempting so great a change in mar-
keting methods.**Agricultural Notes**Manitoba Province has established
a bureau of labor at Winnipeg.Farmers of Tasmania are each year
devoting larger areas to fruit growing.The earnings of tolls for the use of
the Panama canal passed the \$4,000,-
000 mark on June 6.To make paper pulp from cotton
stalks a mill has just been erected at
Greenwood, Mississippi."Mica bran" is now manufactured
by Nebraska and Texas factories for
concrete facing work to produce rock
effects.The Farmers' Cooperative Elevator
Company of Calgary has let contracts
for the building of ten grain elevators
in Alberta, Canada.The International Apple Shippers'
Association will hold its twenty-first
annual convention and apple exhibit
at Chicago, August 4, 5 and 6.Of the licorice paste manufactured
in Spain only ten or fifteen per cent
is purchased in Europe, all the rest
being sent to the United States.The United States geological survey
has just issued a guide book (Bulle-
tion 612) describing the Overland
route from the Missouri River to the
Pacific Coast. Other volumes will de-
scribe the Northern Pacific route, the
Santa Fe route and the Shasta and
coast routes.A curious bronze-colored orange
marked with one or two longitudinal
orange-yellow stripes, but having the
odor of the edible orange and a sweet
juice is on sale in the London mar-
kets and is supposed to be a cross
of the bronze Madagascar and the
Spanish sweet orange.The great demand for cheese in the
war zone has induced many butter
factories in New Zealand to change
to the manufacture of cheese. It is
claimed it takes 2½ gallons of milk
to produce a pound of butter, while
one gallon of milk will produce a
pound of cheese, and the former
wholesales at 32 cents per pound and
the latter at 18 cents per pound. One
company has opened 22 cheese fac-
tories.Hawaiian pineapple growers are
planning to send 20 to 50 carloads of
fresh pineapples to the United States
each week after August 15. This
would mean 2,000,000 to 5,000,000
pounds each month. Heretofore the
Hawaiian pineapples have been sold
in American markets almost wholly
in preserved form, while the West In-
dies have supplied the fresh "pines."
Hawaii has highly developed the
canned-pineapple business, but is
growing an excess for that purpose
and now seeks another outlet.On June 1 of the current year, says
the Scientific American, the number
of automobiles in the United States
reached 2,000,000. To run 2,000,000
cars for one year requires at the very
least 1,000,000,000 gallons of "gas,"
worth \$130,000,000; 20,000,000 gallons
of lubricating oil, worth \$8,000,000;
12,000,000 tires, worth not less than
\$16 apiece, or \$192,000,000; accessori-
es and extra comforts, goggles,
gloves, and caps, \$50 per car, or \$100,-
000,000; garage charges on short tours
(exclusive of gas and oil), \$100 per
car per year, or \$200,000,000; repairs
made necessary by wear, tear, and
accident (exclusive of tires), \$50 per
car per year, or \$100,000,000. Total
running expenses for all cars in use,
\$730,000,000.

Agricultural News Notes

of the Pacific Coast

Northern California

Much work is being done in preparation for the Sebastopol Gravenstein Apple Show, August 14-22.

Orchardists in Santa Rosa are complaining because of serious infestation of aphids and many are spraying with tobacco mixture.

The California Ripe Olive Association, which has just been formed in Northern California, is starting out on a grand campaign for membership.

The bureau of plant industry of the United States department of agriculture has just issued a bulletin on loganberries and blackberries at Sebastopol.

Grasshoppers are doing considerable damage in the district between Gridley and the Feather River. Farmers are using poisoned bran mash to destroy them.

Growers of the Paradise Ridge, Butte County, at a recent mass meeting, discussed the bonding of the district to install a gravity irrigation system to cost \$25 per acre.

In a wool sale at Cloverdale the first of the month several bales of long wool were sold at 27½ cents, short wool at 25. Twelve bales of exceptionally fine light wool brought 28½ cents.

An expert from the United States department of agriculture is making investigations in the vineyards near Yuba City to determine materials which will prevent spread of phylloxera.

There are approximately 40,000 acres planted to rice in this state, 10,000 of which are in Colusa County. Growers in several different sections are calling for more rice mills to handle the crop.

Directors of the Nevada County Cannery Association have decided not to operate the Grass Valley cannery this year. The date of their annual meeting has been changed from December to June.

The West Coast Potato Association will hold sessions July 26-27 at Palo Alto during the week of the State Fruit Growers' convention. This is the first meeting of the association since its organization at Stockton last year.

To the owner of the cow showing the greatest production of butter fat for the 12 months beginning October 1 a cup has been offered by the Business Men's Association of Chico, Butte County. The contest will be conducted by the Gridley Cow Testing Association.

The Anderson Cooperative Creamery of Shasta County recently elected the following officers: President, Fred S. Field; vice-president, T. W. Graham; secretary and treasurer, John Gilman; directors, Dr. C. A. Bell, H. W. Knapp, F. S. Field, T. W. Graham and John Gilman.

Butte County supervisors have voted to institute a county-wide campaign against the yellow star thistle. The county horticultural commissioner is instructed to serve notice immediately on property owners whose lands are infested. There has been much contention over this weed campaign.

Central California

Moles are reported as being a serious pest in Porterville orchards.

Tulare County is still pulling for the State Fruit Growers' Convention in the fall.

Porterville ranchers are experimenting in the raising of beans on dry grain lands.

The Visalia sugar factory is reported as running to its full capacity of 300 tons per day.

Dates have been chosen for the district fair at Merced. It will be held September 23, 24, 25.

The sugar beet harvest of Alpaugh, Tulare County, is estimated at 5000 tons. The work of harvesting has begun.

Watermelons are going out by the carload from Dinuba, Tulare County. Six dollars per ton is the common price.

An examination for apple packing inspectors was held at Watsonville yesterday by the state civil service commission.

Dairymen of the Salida section of Stanislaus County are interested in the establishment of a milk condensary at that point.

Thirty-five thousand dollars has been appropriated by the San Joaquin County supervisors to pay for another block of state highway bonds.

A fall meeting is proposed for the mountain farm bureau centers of Madera County. It is proposed to have exhibits of products at this meeting.

The Modesto irrigation district is constructing concrete gates at the heads of laterals from the main canals to replace the present wooden structures.

A model dairy with perfect equipment is to be installed at the Lemoore union high school. The new buildings and the new stock will be ready at the fall opening of school.

The Turlock Merchants' and Growers' Association, a newly organized co-operative marketing concern, has engaged a sales manager to handle the cantaloupe crop of members.

The light alfalfa crop in the Newman section of Stanislaus County has been investigated by V. C. Bryant of the experiment station of the state university and he has determined it due to excessive rainfall rotting the roots.

San Joaquin County has an assistant farm adviser in the person of C. J. Williams. Farm Adviser Lyons had so many calls that it became impossible for him to fill them all. The assistant is giving particular attention to boys' clubs.

The California Green Fruit Association is sending out notification to all members that a quarter of a cent per package will be levied on all packages of green fruit shipped by members, the funds so collected to be used in advancing the general interests of the association.

County Horticultural Commissioner Rouillard of Fresno County has requested the supervisors to pass an ordinance requiring each packing house or individual shipper handling fruits to register at his office before the standardization bill goes into effect on August 7th.

Southern California

The dove season opens September 1. It lasts three months.

Imperial City shipped a trainload of 35 cars of steers to Kansas City, last week.

Experimental plantings of black-eye beans have been suggested for the Imperial Valley.

Ventura County has 1500 automobiles. This makes one for every 12 people in the county.

Bee Inspector Pleasants of Orange County reports many hives infested with European foul brood.

Brawley has already passed the total carload shipments of last season, with many melons yet to go.

Date palms of the Heber gardens are so full of fruit that it has been found necessary to cut out much of it.

The Calexico district is estimated to have 20,000 head of cattle in pasture. A heavy shipping season is anticipated.

Orange growers of Orange County report a light setting of fruit, some even estimating the crop at one-half that of the present season.

Commissioner Waite of Imperial County recently held up a shipment of Sudan grass seed as it was impossible to distinguish between seed of Johnson grass and Sudan.

An effort is being made to raise \$3000 by subscription at Anaheim, Orange County, to dike the Santa Ana River above the new concrete bridge between Anaheim and Olive.

Shipments of oranges from the Fillmore district of Ventura County for the past nine months are given as over 200,000 boxes in the report of the county horticultural commissioner.

The Jurupa and Arlington sections of Riverside County are discussing with representatives of the Chino sugar factory the possibilities of raising beets next year on their lands.

The Pomona Valley Canning Company made a record run one day last week when it put up more than 40 tons of fruit. Most of it was apricots, packed in gallon cans, for bakers' use.

Walnut growers of the Simi section of Ventura County have formed a packing and marketing association. It will be known as the Simi Valley Walnut Growers' Association. It is capitalized at \$5000.

The record for daily shipments of cantaloupes from the Imperial Valley was broken last week when 237 express cars were hauled out within 24 hours. Most of the cantaloupes go to Eastern markets.

Peach growers north of Chino want a cannery at Chino. They say that they can haul four loads to Chino in a day against two loads to Ontario or Pomona because the haul to Chino would be down grade.

County supervisors of San Luis Obispo County have concluded to buy \$135,000 of state highway bonds, the money to be used in completing the road from Atascadero to Paso Robles. When this section of the road is completed there will be left unfinished only a few miles in the southern end of the county.

The Coast

The egg buyers of Portland have established a grading system on eggs.

A carload of honey was shipped from Yuma one day last week to Ft. Worth, Texas.

Halibut from Alaskan and British Columbia waters are being shipped by express to New York and Boston.

Hot weather and lack of moisture is ripening up the fall wheat in Whitman County, Washington, too rapidly.

The North Portland stock yard reports heavy shipments of hogs received, but condition most unsatisfactory.

Stock men of Arizona are realizing the necessity for putting in water systems. Many wells have been dug on the ranges.

A corn and hog show will be featured at Prosser, Washington, October 22-24. "Forty boys are entered in the pig contest."

Stockmen in the Coconino forest reserve are building a 50-mile drift fence, separating the Verde from the Little Colorado slope.

Grain crops of Cascade County, Montana, are in unusually fine condition. The yield is estimated at 20 per cent above last year's.

Arrangements are being made for a big sale of registered live stock at the Cascade International Stock Show, to be held November 22-27.

The acreage of wheat in Twin Falls County, Idaho, is 30 per cent greater than last year. The crop will be ready for harvest the last week in July.

An effort is being made to pool the peach crop of the Wenatchee Valley, Washington, under general supervision of the Northwest Growers' Council.

Cow testing work being carried on in the Coos Bay section of Oregon is proving most satisfactory. Many high producers are being discovered by the tester.

The warm weather now prevailing in farming sections about Moscow, Idaho, is welcomed by grain farmers as it will ripen off the grain and stop the rank growth of straw.

The State Live Stock Sanitary Board of Oregon has annulled its former quarantine order against cattle shipments from many states and the new order includes only a small portion of the Southeast.

All-day picnic meetings have been in order at local farm bureau centers in the Coos Bay section of Oregon. Dairy instructors from the state agricultural college at Corvallis have been present and addressed members.

At a meeting of the directors of the Oregon Hop Growers Association at Salem the executive committee announced that there is now a membership of 666, controlling 50,000 bales of hops. The association has a capital stock of \$100,000.

Live Stock Commissioner A. J. Splawn of North Yakima has been appointed by the state of Washington to prepare a live stock exhibit for the stock show to be held in October at the San Francisco exposition. He is appointing committees to secure exhibits.

NATIONAL EXPOSITION, SAN FRANCISCO, 1915

Live Stock and Dairy

THE PURE MILK BILL

Written for California Cultivator
By Harry A. Chamberlain, Assembly-
man from Los Angeles

AN analysis of the so-called "Pure Milk" bill passed by the recent legislature should prove interesting to those engaged in the dairy industry. Concisely, the purpose of the bill as outlined in its title is to prevent the sale of impure and unwholesome milk, to grade milk and to empower municipalities to establish and maintain an inspection service.

Under the provisions of the new law which will not go into effect until October 1, 1916 in order to allow dairymen ample opportunity to meet its demands, it prohibits, among other things the sale of milk, except in bulk to the wholesale trade, from cows that have not passed the tuberculin test unless it has been pasteurized by the holding process at a temperature not less than 140 degrees Fahrenheit for 25 minutes; milk for drinking purposes shall not be heated above 145 degrees Fahrenheit.

For the purpose of the act milk is graded as follows: certified milk, guaranteed milk, grade A milk, grade B milk and milk not suitable for human consumption.

Grade A milk shall conform to the following requirements as a minimum; if raw, it shall consist of the clean raw milk from healthy cows as determined by physical examination and by the tuberculin test by a qualified veterinarian under the supervision of the health authorities, and from dairies that score not less than 70 per cent on the score card adopted by the United States bureau of animal industry, department of agriculture. The tuberculin test must be repeated annually if no reacting animals are found in the herd. If reacting animals are found they must be removed from the herd and the tuberculin test repeated in six months. All cows are to be fed, watered, housed and milked under conditions approved by the health authorities. All persons who come in contact with the milk must exercise scrupulous cleanliness and must be free from germs of typhoid fever, tuberculosis, diphtheria or other infectious diseases. Absence of such infections shall be determined by cultures and physical examination, to the satisfaction of health authorities.

This milk is to be delivered in sterile containers and is to be kept at a temperature established by the health authorities until it reaches the ultimate consumer, at which time it must contain less than 100,000 bacteria per cubic centimeter. If pasteurized it shall come from cows free from disease as determined by examination by a veterinarian once every six months and shall contain less than 200,000 bacteria per cubic centimeter before pasteurization and less than ten thousand bacteria per cubic centimeter at the time of delivery to the consumer.

Grade B milk shall come from cows that are determined healthy by examination and before pasteurization shall contain less than one million bacteria per cubic centimeter and after pasteurization shall contain less than fifty thousand bacteria per cubic centimeter.

The sale of any milk as grade A or grade B milk which does not conform to the foregoing requirements and such other rules and regulations as prescribed by the health authorities is prohibited. The sale of any milk, raw or pasteurized, as guaranteed milk must first be approved by the health authorities and must be of a higher quality than the grade A milk.

All milk stored for pasteurization must be kept at a temperature established by the health authorities up to the time of delivery to the pasteurization plant and there rapidly cooled after pasteurization to a temperature of 50 degrees Fahrenheit or

below and maintained until the time of delivery to the consumer. All pasteurization plants shall be equipped with self registering devices for recording the time and temperature. All such records shall be preserved for a period of two months and shall be available for inspection by the state veterinarian, state dairy bureau or the local health authorities. Pasteurized milk shall be marked with the day of the week of pasteurization and must be delivered to the consumer within 48 hours thereafter. If milk is repasteurized it must not be sold unless it is labelled "not suitable for human consumption."

All milk not suitable for human consumption may be sold for indus-

trial purposes provided it is heated to a higher temperature than is necessary for pasteurization.

Another bill passed and soon to become a law requires all butter imported into California to be so labeled. It also makes it the duty of the dealers in imported butter to display a sign to that effect in their storeroom. Failure to comply with the law is made a misdemeanor punishable by a fine of not more than \$250 and imprisonment for not more than six months. An amendment to the present law regulating the manufacture and sale of dairy products prohibits misrepresentation as to the name of the producer and the locality where it is produced upon the labels of butter.

BARLEY AS FEED FOR LIVESTOCK

In the southwest barley fits well into the rotation of farm crops. Its ability to grow in the winter is especially valuable. About November 1 is considered the best time to seed barley in southern Arizona. It should make a growth and furnish pasture in February and March, or it may be allowed to ripen for grain or be cut in the milk stage for hay. As winter pasture it has no superior except with a combination of rye and vetch, and it furnishes excellent succulence when little other green feed is available. If one pastures a small portion at a time and allows the stock to pick it down to within three inches of the ground and then removes the animals to another pasture, it may be grazed three or four times, says R. H. Williams, Animal Husbandman of the University of Arizona Agricultural Experiment Station.

Barley should be cut for hay in May. In this way one may obtain one to three tons of roughage per acre. This barley hay is a good feed for stock used with alfalfa. It is a well recognized fact that alfalfa hay, or pasture, is not complete food for any kind of live stock. Farmers would do well to plan a variety of foods to give animals. Barley hay should be one of the chief foods in this connection.

As barley grain is one of the cheapest concentrates, farmers should understand its feeding qualities. There are many false prejudices against barley. Many dairymen refuse to feed it to their cows, claiming that it causes abortion and impaction. With one exception, that of feeding barley to brood sows advanced in gestation, its feeding value is improved about

**"Jackson
MADE"**

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps

ten per cent by grinding or having it rolled. Barley has long been recognized as a special food for horses. The Arabs feed it to their horses to supply concentrates. It is especially rich in carbohydrates but deficient in protein. "Hog men" claim that it is the best single grain for feeding pigs in the dry lot.

It is interesting to note the special use made of barley for stock food by recognized authorities. At both the Utah and California Experiment Stations barley is the chief grain fed to dairy cows to balance alfalfa hay. The world's record milch cow "Tilly Alcartra" was fed on the ration rich in barley. This cow consumed during the year on test 1828 pounds of barley and an equal quantity of oats. These two feeds constituted the grain ration. Mill products also were fed. She consumed 1282 pounds of bran and 1208 pounds of linseed meal. Many other cows on advanced test have been fed a considerable quantity of barley. The grand champion steer "Thick Set Boy," the most noted animal on the Pacific coast during the past two years, was fed a grain mixture rich in barley almost all his life. The first year his grain consisted of equal parts of rolled barley and rolled oats, with a little bran. From May to September, while he was being fed for his final show-yard achievements, he was given about 16 pounds of a mixture of rolled barley, two parts; rolled oats, two parts; and bran one part, by measure, and a small amount of molasses. This feed must have been especially suitable for him because he weighed 825 pounds as a calf, 1400 pounds as a yearling, and 1750 pounds in his two-year old form. His quality and bloom must have been excellent as the former is indicated by his winnings and the latter by the fact that he dressed 71.8 per cent.

RATION WITH OAT HAY AND BEET PULP

From his experience in balancing dairy cows' rations, especially where dried beet pulp is a factor. Mr. Harold McAlister of Chino adds the following to the comment made last week by Professor Woll and Mr. Guy Miller.

I do not think that a good dairy ration can be suggested if oat hay is used as a roughage as it is not as palatable to cattle as alfalfa, it is too low in protein and it is too high in fiber. Oat hay only contains 76,649 calories of fuel value while alfalfa contains 94,936. As it probably takes over 50,000 calories of fuel value for the digestion of a food alone it will be seen that alfalfa will have almost twice the available energy left as oat hay and therefore will be about twice as valuable. If oat hay is thus worth \$8.00 per ton, alfalfa is worth \$16.00 per ton. If, however, oat hay is used, some extremely high protein concentrates must be used to balance the ration. Cottonseed meal can be purchased for about \$22 per ton in the Imperial Valley but the freight would probably add on \$10 to Monterey, which would make it too high-priced in comparison with alfalfa at \$10.50 per ton. Oat hay only contains 4.07 per cent digestible protein so there would have to be fed five or six pounds cottonseed meal to supply the necessary protein. As this amount of cottonseed meal cannot be fed to dairy cattle for a long time without running serious chances of impairing their digestion, cottonseed meal is out of the question with good cows. Coconut cake, which contains 15.4 per cent digestible protein, can be purchased at about \$23 per ton at San Francisco, and the freight would make it about \$27 at Monterey. Coconut cake, when fed with alfalfa and beet pulp, makes a most economical and well-balanced ration. Mr. Frank Morris has recently put all of his cows on yearly test on such a ration and he states that they give about as much milk as when fed the former ration, with a great saving in high-priced concentrates. Coconut cake, however, would have to be fed in such large quantities to balance a ration with oat hay that it would be much more expensive than if a small quantity was fed with beet pulp and alfalfa, and as it is an exceedingly concentrated food it might have a bad effect if fed permanently.

In our own experience we have found beet pulp an excellent feed, hav-

ing lately made several records over 28 pounds of butter in a week on a ration mainly composed of beet pulp, and several over 90 pounds of milk in a day. The same cows have a month or so afterwards given practically as much butter fat on a ration composed entirely of beet pulp and alfalfa. From our string of 30 cows we are now getting over 16 cans of milk daily from the same ration, and I think that the correspondent will probably find that on the whole beet pulp, about eight pounds per day, and alfalfa fed ad libitum at the prices quoted is the best and most economical ration.

MILCH GOAT GRADES

As many have desired to enter the milch goat industry but have been prevented by the difficulty in securing pure-bred stock, we quote the following, written by Winthrop Howland, in a former "Angora Journal," for the valuable hint it contains:

Some eight years ago I secured a doe that as a kid had been caught on Catalina Island from among the wild

One of G. O. Hillier's Fine Bulls.

goats that for probably a century or more have inhabited Catalina.

If ever there was a reward for "bread cast upon the waters" my purchase of this poor little doe Zoble was a case in point. I did not want Zoble, for she was very small, unprepossessing and half-starved, and in wretched condition, but she was so abused and unhappy it seemed the only merciful thing to do to buy her and take her away from her cruel master.

Three dollars was the price I paid for Zoble, and when she was brought to my ranch her coat appeared in so scurfy a condition I feared she might spread some disease among my Toggenburgs, so she was given to a small boy in the neighborhood, who promised to give her proper attention. It had been my original purpose to breed Zoble to my imported Toggenburg buck, Prince Bismarck, but after thinking over the matter this seemed unwise, owing to her unhealthy skin, so she was bred to a part Catalina hornless buck whose pedigree I never was able to fully determine. Under proper feeding and care Zoble thrived and became a perfectly healthy and respectable looking doe, and in due time dropped twin doe kids, oddly enough both hornless, though Zoble herself was horned.

These kids were so promising I bought them and their dam, and their purchase has proved a splendid investment. Poor old Zoble passed away some four years ago, but from her and her first pair of hornless doe kids, Dinah and Daisy, we have in eight years produced 31 does, many among them very fine milking types. At a conservative estimate these 31 offspring are easily worth \$1000.

Recalling the original purchase of Zoble was the large sum of \$3, her progeny have made a very handsome return on the first investment, not counting the value of all the yield of their milk.

Zoble having been stunted as a kid, gave only a very moderate yield, about one and a half quarts per day. Dinah, the best of her first kids, has yielded three quarts per day, and Dot, a half Toggenburg daughter of Dinah, has a record of four and one-half quarts per

day. Delilla, a three-quarter Toggenburg, granddaughter of Dinah, is one of, if not the finest, types of grade Toggenburg does I have ever seen, large of frame, gentle in disposition, with full Toggenburg markings and a record of over five quarts of milk per day.

This season Delilla presented us with a very beautiful seven-eighth Toggenburg doe that has all the points and characteristics of a pure-bred Toggenburg, and we are hoping for remarkable results from this kid when she matures.

From what I can learn of the origin of the Catalina goats they were left upon the island something like a century ago by a Spanish sea captain and undoubtedly were of some good European milking strain. They are marked usually black and tan and white, and their hair is short and straight. They cross especially well with Toggenburgs, and offspring of this cross are unusually hardy and vigorous. When one considers what a valuable type of doe can be produced by careful selec-

tion and judicious crossing of native does with Swiss bucks, there is no reason why those of limited means should not be able to obtain grade does yielding a generous flow of delicious milk at a reasonable figure.

These grade does remain in profit almost like a Toggenburg. Dot was yielding two and one-half quarts daily 10 months after kidding and was with difficulty finally dried up before her next freshening.

Many people who desire to keep milch does instead of cows, hesitate before purchasing pure-bred stock on account of their high price. My advice to them is, secure a good grade doe from a proven line of heavy milking dams, and though there is not the satisfaction of owning a registered pure-bred, nevertheless if an assured flow of milk is what is needed, the well-bred grade doe can be guaranteed to meet the demand.

VALUABLE PAMPHLET

The American Guernsey Cattle Club has recently published a valuable pamphlet for the benefit of Guernsey breeders and the public in general who are interested in knowing what this breed is accomplishing. This pamphlet is of handy size, neatly bound in grey cover, is well illustrated with pictures of the leading cows of the breed and contains much valuable information. In the fore part of the book appear statistics regarding the Advanced Register work which have been compiled in such a way that they make very interesting reading. Fifty-five of these cows have three or more yearly records. The name of these animals, together with the production and the ages at which the records were made are given in detail. What is known as the 35 class leaders or the cows holding the five highest records in each of the several classes from two years of age to five are given as they appear on April 15, together with the average of all cows tested in each class and the average for the breed.

BUTTER SCORING CONTEST

By L. M. Davis

There were fewer entries and a lower average score at the July scoring of the University of California Educational Butter Scoring Contest than at previous scoring held in May. Twenty-four buttermakers took part, and the average score was 91.79. The butter was scored in San Francisco, July 14, by Mr. T. J. Harris, official inspector of the San Francisco Wholesale Dairy Produce Exchange, L. M. Davis and H. S. Baird of the Dairy Division, and with the exception of those who do not wish their scores published the results were as follows:

Hot Weather Flavors Common

In some of the entries the effects of hot weather were apparent. These cubes possessed an unclean smothered flavor such as is expected when cans are not thoroughly washed and aired. The dirty can trouble is one which can be overcome by a little attention, and every buttermaker should insist upon cream cans being sent back to the dairyman in a good clean condition. The washing of cans in the creamery is not an enviable job, but it is a very important one. If the can washing is left to a man who is not careful, unclean flavors are bound to develop in the butter. Where cream is gathered and the cans are left on the dairy, there is also a danger unless the dairy is equipped to handle this part of the work properly. Improper care of utensils and insufficient cooling are perhaps the two principal causes of trouble just at this time of the year, and the flavors found in the butter, the low average of this scoring as well as reports from buttermakers, point to these conditions as being largely responsible for flavor defects which prevail at this season. Each year buttermakers will find it necessary to do work along the line of instructing some of their patrons on the proper care of cream, and whether this is done in the form of a letter, a circular or a personal visit it is a matter which must not be overlooked.

Body Defects Reduce Scores

Faulty body is becoming too common in much of our butter. While it is true that some buttermakers may not find that they are sacrificing on price through marketing butter which lacks good body, it is very true that the market value of much butter is kept down by such a condition. At this scoring the most common defect was a gummy, sticky body. Temperatures and methods of working were the probable causes. Some makers are not holding their cream after pasteurizing long enough for it to become thoroughly chilled, with the result that the temperature raises considerably during churning, and when the butter is washed at the temperature necessary under this condition, poor body is found in the butter.

Many buttermakers do not use their thermometer enough, but depend too much upon guess work. It is the business of a buttermaker to make a piece of goods that will hold up well on the consumer's table, and when he finds it impossible to do this his product becomes less valuable. Creameries should not expect their butter dealers to assume the entire responsibility so far as the successful marketing of their output is concerned. All dealers can sell good butter, but few of them can sell poor butter so profitably. Butter which is "off," either in flavor, body, color or salt, is a poor seller, and eventually the creamery will suffer. The creamery policy, therefore, should be to let nothing go undone which will make for the finest marketable article.

Keeping Quality to Be Studied

Twelve of the cubes scored were placed in cold storage and will be periodically examined for keeping quality and shrinkage. Of the 12 cubes nine were made from pasteurized cream to which starter was added, one from pasteurized cream to which no starter was added, two from unpasteurized cream containing starter, and one from unpasteurized cream containing no starter. Pasteurizing temperatures varied from 147 degrees Fahrenheit to 172 degrees Fahrenheit, and amounts of starter from 10 per cent to 40 per cent. These cubes will be examined at several intervals during the next three months.

FOOT AND MOUTH DISEASE
CURED

Dairy herds held at Chicago since the National Dairy Show last October, when the outbreak of the foot-and-mouth disease caused them to be quarantined, are now cured and ready to be sent back home, it is announced by Dr. Hughes of the Chicago Veterinary College, who has been in charge of these cattle since they were interned. If these cattle show no disease and fail to transmit it to others at home, the achievement of having successfully cured it will be a high one, according to government officials and scientists. Dr. Hughes was called in to handle the case when the dairy cattle owners got together to find a solution that would not send their cattle to slaughter and yet save them for future breeding. As the cattle were rated as worth more than a million dollars, the stake was big.

Scientists and livestock officials were skeptical, but the herds were kept together and no animals were shot. When Dr. Hughes had the livestock cured he consulted the bureau of animal industry officials at Washington for permission to take them back home. They wanted to be convinced however so test herds of cattle and hogs were put in with the dairy herds to see if they would contract the disease. They did not find any trace of it in the "clean" cattle 30 days after, so the government put another 30-day trial on the herds, and now that it has ended they must allow the cattle to go.

The disease is now under control in all parts of the country, according to the United States Sanitary Association which met in Chicago a few days ago and drafted a statement to be sent state officials in every state urging conformation to federal rules in keeping the country rid of the disease and permitting the shipment of livestock from one state to another.

Paralysis After Milk Fever

Less than an hour after I wrote you regarding treatment of my cow for milk fever she was up and around, seemingly as well as ever, but without any milk. The doctor says he can bring her out all right now as well as back to her milk, nevertheless I would be pleased to hear through the Cultivator the treatment before, at the time and after this trouble.—Subscriber, San Jacinto.

This refers to the article in last week's Cultivator under the same heading. To prevent milk fever, cows should be fed sparingly for two or three weeks before calving and the bowels should be kept moderately free even if it is necessary to give a laxative in the feed. A handful of epsom salts and half as much common salt in the feed once a day for ten days before calving will usually prevent milk fever. When milk fever is present it is best to employ a veterinarian as he is familiar with such work. To start the flow of milk again be sure she gets plenty of drinking water, and rub and knead the udder often and milk her out clean even if very little milk is present at the beginning. The following tonic will also help to start the flow of milk: Powdered gentian four ounces, powdered nux vomica three ounces, bicarbonate of soda four ounces and farina enough to make a pound. Mix and give a large tablespoon once a day.

Bloody Urine

I have recently lost several calves. They will pass blood through urine and die within a day or two. I feed them skim milk and let them loose on alfalfa pasture, there being a small patch of swamp, but water is clear and running.—Subscriber, Devore.

Bloody urine may be caused by Texas fever, anthrax or the eating of some poisonous weeds. Would first advise keeping them away from the swamp as they may be getting poisonous weeds there. Then if the trouble continues employ a veterinarian to find out if it is anthrax or some other trouble.

Scours

What is the best treatment for scours in calves?—Subscriber, Devore.

For the scours give two or three drops of zenoleum once a day mixed with a little water or milk. A few days' treatment will usually eliminate the trouble.

Lameness

Can you tell what is wrong with my four-year-old horse? For the last month or so when I work him he gets very lame. Have looked him all over and examined his feet but could find nothing wrong. He was never sick before.—Subscriber, Tulare.

Is he lame in front or behind? Does he drag the foot or simply refuse to put his weight on it? Is the foot warmer than the opposite one? Is he shod or not? You see we must know something about the character of the lameness before we can even make a guess at the answer.

Community breeding is a big step in the right direction in carrying on the great business of farming.

Poultry for Profit

WHAT IS ROUP?

Written for California Cultivator
By Jean A. Koethen.

THE first sick hen I ever had was a White Leghorn. The first symptom of illness noted was her disinclination to move. She sat all day, refusing to move or eat, with feathers ruffled and drooping head. I do not remember that there was any discharge from nostrils or eyes, but there was from the first a sickening odor which my poultry book told me belonged to roup. As I did not know what to do for her, I did nothing, and she died. Probably she would have died if I had doctored her. I have hardly ever seen a hen prostrated in this way, whatever the nature of her malady, that recovered.

My next roup case, as I remember, was an Orpington pullet. There was a discharge from the nostrils and also from the mouth, and some rattling in the throat, and the same sickening odor I had noticed in the Leghorn. I came afterward to recognize this peculiar, unmistakable odor as the most certain symptom of roup. Some times at night I have gone to the henhouse when I did not know there was a case of roup on the place and have recognized its presence instantly by that odor.

Then there were young chickens with swollen, sticky eyes, and a thick discharge from the nostrils. They were always dull and mopy and most always died. We were living at that time on an exposed hillside, swept by the wind from the ocean and shaded by large trees, and for two years we were never free from roup and colds. I tried bluestone, permanganate of potash, kerosene, quinine, and most of the other remedies recommended by experts. Quinine sometimes had excellent results, but nothing else seemed to work, so I finally gave up doctoring. At the end of the two years we moved back farther from the coast to a more sheltered location, built our houses on a southern slope, facing south, and from that day to this I have not seen a case of roup or even a common cold. Our houses have open fronts but are not always free from drafts. Sometimes in a heavy rain the roof leaks, and I remember one terrific rainstorm when we went out in the morning to find the long house flooded and the hens wading. But no roup resulted. I remember another time when my best breeding pen was housed during a fierce nor'easter in a coop with two or three large cracks on the rainy side,

and still no roup. I have seen the coop where my little chicks were confined nearly washed away in a sudden downpour, for our hillside is steep and our rains heavy, but never a swollen eye or a rattling throat. All these things lead me to believe that drainage, both air and water, is very important in preventing roup. Our dry hillside offers no chance for water to stand, indoors or out; the cold, damp air slides away from us in the same way; and if the dirt floors of our houses ever do become wet, a current of air is sent through which quickly carries away all dampness.

But a suitable location without fresh air in the houses at night is as ineffective as sending a tubercular patient to the mountains and then shutting him up in a tight house with sealed windows. Chickens do not sweat as human beings do. The moisture which in the human passes out through the pores, in a hen passes out through the lungs with the breath, and the air of an unventilated house soon reeks with moisture if many hens are confined in it. Add to this moisture the poison from unremoved droppings, often far too near to the roosts; and the heat from bodies whose normal temperature is 105 degrees or more, to say nothing of the lack of oxygen, which hens need exactly as much as we do, and you have conditions which inevitably breed roup. The birds come out of their sweat box into the chill of early morning. There is a sudden reaction, the head and eyes, always sensitive in fowls, begin to swell, the nostrils to discharge, and soon we have a full-fledged case of roup.

And what is roup? The name is often applied to any sort of cold in the head, but more often limited to the sort of cold which is characterized by lumps or swellings containing cheesy pus. In the Maine station's bulletin on poultry diseases, a compilation which goes very fully into the matter, a distinction is made between simple or non-contagious catarrh and roup. The former is thus described: "In simple, non-contagious catarrh, the affected birds are more or less dull, they are disinclined to move, their appetites are diminished, they sneeze and the mucous membrane is thickened, causing some obstruction to breathing through the nostrils. There soon appears a thin watery discharge which later becomes thick and glutinous, the eyes are often watery, held together by a thick, viscid secretion. In very severe cases the breathing is entirely through the mouth and is accompanied by a wheezing or snoring sound, the appetite is entirely lost, a thin liquid escapes from the mouth and the bird soon becomes exhausted and dies."

Many authorities would, I think, include such cases as those described above under roup, but this bulletin says: "By the term roup we generally understand a more or less putrid discharge from the nostrils, which lasts for weeks or even months. The disease often follows a common cold, to which fowls, especially young fowls and those of more delicate breeds, are much predisposed."

"In the first stages of roup the birds often cough and sneeze and the breathing is noisy, caused by the partial closing of the air passages which become blocked with the discharge from the nostrils. When the air passages are entirely closed the fowl has to open its beak in order to breathe."

"Sometimes a yellowish cheese-like mass forms in the nostrils, growing quickly and pressing the upper walls of the nose upward; if this mass is removed an uneven bleeding surface is left which forms a new cheesy mass."

Sometimes the eyes are mainly affected, and we have what is called "roup of the eyes," which become red, swollen and hot, and then begin to secrete a liquid, "at first clear, then of grey, slimy, putrid character, which dries on the feathers at the side of the head, causing them to stick

together or fall out." Sometimes the secretion becomes a yellowish, cheesy mass in the eye-socket.

I have given these descriptions rather fully because it seems important that we know the disease when we see it and know whether we have the contagious or the non-contagious form. There is still another form of roup in which the throat is affected, yellowish or whitish patches appearing there and in the mouth. This is known as the diphtheretic roup and is the most serious form of all.

Treatments for Roup.

The best way to treat roup is to prevent it. This is axiomatic. When roup or catarrh is discovered in the flock, be it but a single case, the first thing to do is to hunt out the cause and remedy it. Many times an epidemic of roup may be averted by letting fresh air and sunshine into the houses, getting rid of dampness in floors or puddles in runs and cleaning up generally. Go to your henhouse at night and you will learn a lot. Is the air heavy and hot? Open the doors, knock out a side of the house if necessary, but manage somehow to give your birds air you would be willing yourself to breathe. "Put yourself in his place" is a good rule with chickens as well as people. If you enjoy sleeping in the open be sure your fowls like roosting in trees, and it is a good plan to let them do this in summer when the thing can be done.

Having removed as far as it can be done without changing location, the cause of roup, what shall be done with the cases that exist? Remove them first of all from the flock, for real roup is contagious. Put them where they will have an extra amount of sun and air, and if they will eat, an unlimited amount of green feed. This much by the way of sanitation. Medical treatment is not so easy to prescribe. There are treatments enough and roup cures galore. Maybe one is just as good as another. The trouble is that real, genuine roup is very hard to eradicate from the system. Apparently cured, the taint seems to remain in the blood, and it comes back again and again, unfitting the hen for a layer and the cock for a breeder.

In the days when I had roup I did not know what to do for it. Now that I know what other people do I never have roup to practice on, so I cannot say "This is my treatment and bound to cure." I can only quote the doctors and advise everyone to prevent roup if he can.

Dr. Sanborn, than whom there is no better authority in America, recommends applying the following solution to mouth and nasal passages with an atomizer: Extract of witch hazel, four tablespoons, liquid carbolic acid, three drops, water, two tablespoons.

He uses the spray twice a day, squeezing the bulb five times for each nostril and twice for the mouth.

Dr. Salmon, who is connected with the government experiment station, recommends washing the cavities of the nose and throat with peroxide of hydrogen diluted one to three times with water.

Harison and Streit, in Bulletin 125 of the Ontario Agricultural College, recommend the permanganate of potash treatment, which is easier and more generally used than any other. It consists of first massaging the nostrils both upward and downward to loosen the discharge, then dipping the head into a one to two per cent solution of permanganate. The head is kept in the solution for 20 to 30 seconds. The treatment is given twice a day and continued till all symptoms have disappeared.

The use of kerosene is recommended by many practical poultrymen, but it seems to be very severe. I would far rather depend on peroxide of hydrogen, which is good wherever an antiseptic treatment is desired, or permanganate of potash. This latter drug which was formerly much used in drinking water as a preventive and cure-all, has been much ridiculed as "pink tea" and is now held to be worthless as a medicine when used in this way. It kills disease germs in the water, thus preventing the spread of the disease, that is all. Used directly on the diseased tissues, however, it has decidedly antiseptic effect.

Meet your Business Face to Face

The Cultivator Poultry Book Poultry for Profit

BY
Jean A. Koethen
Graduate of University of Calif.

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

Where is there a thoroughly successful business person, who did not first go over carefully all the ins and outs of his future business? The poultry business is your future business; meet it face to face with all its ups and downs explained thoroughly in the book "Poultry for Profit."

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 13 pages of illustrations, printed on eggshell book, binding full cloth vellum de luxe, at the price of one dollar postpaid.

QUERIES

(Continued from Page 81)

erally the hind quarters that are attacked, and the rabbit becomes so powerless that it drags its hind legs along the hutch floor in a most pitiable manner. The actual cause of the complaint is not known. Some fanciers attribute it to diseased kidneys, others to inbred weakness and want of vitality. Isolated cases of permanent cures have been heard of, but in all probability the trouble was really cramp due to a damp hutch and filthy environment." It would be well to remove at once to dry, clean quarters.

Planting Avocados

A subscriber who has avocado seedlings six feet tall writes regarding transplanting and whether he should top them back. Mr. F. O. Popenoe answers: "The trees should be cut back heavily and balled with as large balls as possible. After transplanting keep well watered, and in a couple of months the new growth will come rapidly. This new growth can be successfully budded this fall, going through the winter as dormant buds. Next year the trees will make a large top. The

budding should be done in late September or in October."

Pure Milk Law

Will the pure milk law affect the small one and two-cow dairies? If I pasteurize milk must I have my cows tested?—Subscriber, Los Angeles.

We call the attention of our inquirer to Mr. Chamberlain's article in this issue of the Cultivator. In any case it is more than a year yet before the bill is in effect. In the meantime the Cultivator will investigate more fully its requirements affecting the small dairyman.

Asphaltum Paint for Roof

For a subscriber who wished information as to the use of a cheap oil or asphaltum paint for outbuildings we have asked Mr. J. L. Quinn of the Standard Oil Company as to the use of oil for such purposes. From his letter which follows we take it that a heavy grade of oil may be used, especially where felt roofing is to be preserved.

"Have to advise that D-grade Calol asphaltum, 50 to 60 penetration, thinned down to the required amount with distillate, may be used for painting outbuildings. In order to mix this the D-grade should be heated until liquid, should then be removed from the fire and the distillate added in small quantities and well stirred, taking care that the distillate does not inflame. For saturating felt roofing, D-grade Calol asphaltum, 60 to 70 penetration, should be used alone and applied hot at a temperature of about 300 degrees Fahrenheit.

Poison for Squirrels

Mr. J. C. Cox of Hemet gives below his manner of preparing poison for squirrels, rats and rabbits, and advises that is surely does the work:

"Take the white of eight eggs and beat as for frosting. Add one pint sugar and two bottles of powdered strychnine. Stir thoroughly, then put in one gallon of dry wheat or as much as the mixture will cover. It should be mixed in a two or three gallon bucket and stirred with a large iron spoon. The poison should be placed on hard ground or rocks near the squirrel dens, but not in the holes. For rabbits scatter the grain around the edge of the field in the evening. The poison should be placed as soon as it is mixed. If farmers will use this faithfully the squirrel nuisance will soon be abated."

Storing Potatoes

An inquirer wishes to know how he can hold for a time his spring grown crop of potatoes and asks in regard to the old-time "pit," in which potatoes and apples were kept through the winter in the East, covered with a layer of straw, on top of which was a foot or two-foot layer of soil. We believe this scheme would work; however, would advise careful trial for the first season. Would make the layer very thick, sufficient to keep a perfectly even temperature. Of course, it is well known that the spring crop of potatoes is not considered a good keeper, but at this time so many have been thrown on the market that prices are very low, and it is thought perhaps that if held a few weeks longer better prices may be obtained. Mr. Guilford states: "I should think this scheme would work all right. There would need to be a good, thick layer of dirt, 18 inches would be better than a foot. As you have stated, it is simply a matter of keeping them cool enough. Another thing that might work would be an excavation like this with some arrangement for opening both ends at night to let a current of cool air pass over the potatoes, closing up these openings in the day time. I know a house in the Sacramento Valley where the temperature is kept down to 78 by opening up at night and closing up tight in the daytime. An underground cellar that could be opened at night and closed in the day time would be the best arrangement for storing potatoes."

AT SAN DIEGO

The above is a view of the Sacramento Valley Building at the Panama-California Exposition at San Diego. Within it the great valley at the Northern end of the state has placed a magnificent exhibit of its productions. It has sometimes been charged that the exhibit at San Diego is more of a local nature than that at most of world's fairs, and in this respect we may correct this impression, for San Diego does not claim to be producing a world's fair. It is an exposition of the Southwest and it is absolutely true to name, and a more wonderful exhibition of products, customs and especially of architecture of the Southwest has never been made. The whole atmosphere of San Diego is that of Southwest America and it is well worth a visit for that one reason.

In the foreground may be seen the exposition pigeons which are becoming famous the world over, and when it comes to photographing we question whether any other live thing has been any more photographed than these pigeons.

GLUE

Prepared glue, such as LePage's and Imperial, is the most convenient for general use, except when large quantities are required, the prepared or liquid glue is cheaper and more easily handled than the flake or ribbon glue.

The prepared or liquid glue may become too thick to work well. Often times by putting the can of glue in a pot of hot water the glue thins enough for use.

The addition of a small amount of vinegar permanently thins the glue, at the same time does not injure its quality.

Prepared glue does not set as quickly as ribbon glue, therefore the clamps must be allowed to remain on the parts glued longer. In preparing surfaces for gluing care should be exercised in getting them true and "out of wind," else the strain under which they are clamped in the gluing process is quite apt to crack the glue, and the joint thereby be rendered useless.—L. D. Crain, Colorado Agricultural College.

Avoid Heating Foods in Hot Weather

Bill of Fare Should Vary Greatly in Winter and Summer

About this time every year the magazines and newspapers are in the habit of publishing a list of "DON'TS" for hot weather. One of the most prominent of these is "Don't eat heating foods during the summer season." Up-to-date housekeepers, having the good health of their family at heart, are realizing more and more the necessity for varying the bill of fare radically in winter and in summer.

In order to prepare an attractive variety of warm weather foods and desserts, every woman should have a thorough knowledge of the possibilities contained in that delicious food product—Cornstarch. While cornstarch is an all-the-year-round article of diet—it is of special value in the preparation of the most delicious ice creams, frozen custards and frappes imaginable. But to insure the best results, it is essential that the cornstarch be of the best possible quality.

Those having the most satisfactory results with cornstarch recipes always depend upon the old reliable Kingsford's brand—which can be obtained at all modern grocers. When ordering Kingsford's Cornstarch, ask your grocer for a copy of the little Kingsford's Cook Book, which contains the recipes for warm weather dishes referred to above, as well as much valuable culinary information.

The Great Ant Killer

A Simple Method of Dealing with This Pest

All sorts of remedies have been tried by housewives in the effort to exterminate the pesky little ant—an insect which has always been one of the most aggravating pests with which the good housewife has had to contend.

Invariably, however, these efforts have been without success, until the discovery of a paste by a baker in Los Angeles which showed women the way to rid themselves of this annoyance forever.

This paste seems to have uncanny powers over ants. It not only drives them out of a house or store, but keeps them out thereafter. Originally prepared for the use of the inventor in his own shop, its fame soon spread with such rapidity as to cause its being placed upon the market for general use.

This little remedy is known as Kellogg's Ant Paste, and can be obtained at all modern druggists or grocers. Try a package today—and watch your ants disappear forever.

MAKE MONEY OUT OF JIMSON WEED LEAVES

It is amusing to note that the leaves of Jimson Weed, owing to the European war, now command a value. Any school boy in California can make \$2.00 to \$3.00 a day picking the green leaves. The Haas Seed Co., No. 1800 Lincoln Avenue, are paying 1½ cents a pound for the fresh green leaves. All you have to do is ship them in a clean grain sack to the concern and get your money by return mail. They pay the freight. Any quantity shipped providing it is not less than 25 pounds will be received by them and paid for. Now is the time to pick them when they are in blossom.

Write for instructions how to pick and ship them to the Haas Seed Co., 1800 Lincoln Ave., Pasadena, Cal.—Adv.

Flyless Homes

Make yourself not-in-the-way inexpensive no baiting mosquito and fly trap from plans sent on receipt of 50 cents. Eliminates in-the-way traps, sticky and poison papers. Greatest catcher of flies and mosquitoes ever invented. Satisfaction guaranteed. Why not be our agent in your neighborhood. Send 50 cents now for full details to FLYTRAP CO., Longbeach, Cal. Reference: Any Bank in Longbeach.

THE PERFECT DAY

When you come to the end of a perfect day,
And you sit alone with your thoughts
When the chimes ring out with a carol gay,
For the joy that the day has brought,
Do you think what the end of a perfect day
Can mean to a tired heart,
When the sun goes down with a flaming ray
And the dear friends have to part?

Well, this is the end of a perfect day
Near the end of a journey, too;
But it leaves a thought that is big and strong,
With a wish that is kind and true.
For mem'ry has painted this perfect day
With colors that never fade,
And we find at the end of a perfect day
The soul of a friend we've made.
—Carrie Jacobs Bond.

A BARBECUE PICNIC

While we were living near a canyon we very often entertained friends informally with barbecue dinners in the canyon. They were enjoyed by all, and they were a complete change to nearly all, also it is an easy way to entertain as there is practically no work in preparing the dinner.

We had the butcher cut steak an inch or more thick and into individual helpings. Each one took a piece of meat, which was fastened on a green stick three or four feet long with sharpened forked prongs at the end. By sticking the prongs through the meat it was held firm so it could not drop off. Each roasted his own meat by holding it over a bed of coals. When the meat was roasted slices of fresh bread spread thickly with butter were passed. (The bread and butter must be very fresh.) Fresh fruit or strawberries and cream and coffee finished the meal. Sometimes we roasted potatoes in the ashes too. Not many dishes are needed as everyone invariably barbecued the second piece of meat for

OUR business in life is not to get ahead of other people, but to get ahead of ourselves. To break our own record, to outstrip our yesterdays by todays, to bear our trials more beautifully than ever we dreamed we could, to whip the tempter inside and out as we never whipped him before, to give as we never have given, to do our work with more force and a finer finish than ever; this is the true idea: to get ahead of ourselves. Whether we win or not, we are playing better than we ever did before, and that's the point after all—to play a better game of life.—Maltbie D. Babcock.

AUGUST PRIZE CONTEST

For the August prize contest let us have new ways of cooking vegetables. In these summer days we want all the green vegetables we can have, but we do get tired of the old ways of serving them.

Summer squash, for instance. Now we always did like the first taste of boiled summer squash, but that was all; the first taste was enough. Recently I tried boiling the squashes whole until tender, then scooping out the top of the center with teaspoon and mashing with the part taken out rich grated cheese, salt, pepper and a little butter. When these are slipped back in the oven and browned they are delicious—to our taste—and no more summer squash spoils on our hands.

Have you tried new ways of preparing spinach, turnips, egg plant, etc. If you have pass them on to your Cultivator friends.

Cash Prizes

For best recipe \$2.00 in cash will be paid; for second best, \$1.00.

Write Early

Recipes will be published in the Cultivator of August 19. All should be in this office by the morning of August 12. Many valuable articles were received two weeks after the close of the July contest, so could not be used. Kindly note the closing date.

Please write on one side of paper only and send one recipe. Address to Household Department, California Cultivator, Los Angeles.

All whose recipes are published will receive a three months' extension of subscription. With your recipe send name of member of your family now receiving the paper that his name may be credited with the extension.

If you have received one extension of subscription this year you are not entitled to another, but all may compete for the cash prizes.

Send Suggestions

We will be glad to receive suggestions for future contests.

PRIZE WINNERS

The first prize for July contest goes to Mrs. E. D. Curl, Earlimart; the second to Mrs. Floy Crosby Smith, Fair Oaks.

the fun of doing it. Sometimes we toasted marshmallows while sitting around the campfire after dinner.

These barbecues are especially enjoyable held in the spring time and at dusk. In case one does not live near a canyon or a wild spot one could have a barbecue out in the yard under some trees.

Here is a salad dressing that is good for sandwiches, to mix with the yolks of hard boiled eggs for deviled eggs or for potato or other salads for a picnic lunch. It is easily made and keeps indefinitely if sealed.

Yolks of six or more eggs beaten very light and mixed with half cup of sugar, one-third cup butter, one teaspoon salt, half teaspoon pepper, one teaspoon celery seed, one teaspoon mustard. Add to one cup of hot vinegar and boil, stirring constantly until thick. Thin with cream.—Mrs. E. D. Curl, Earlimart.

PICNIC LUNCHESES

A picnic dinner, like any other meal, may be as simple or as elaborate as one chooses.

My experience has been with the family when they go for a day's outing, a lunch that will satisfy the appetites of the children and require but little time and labor for preparing, such as the following: Round sandwiches, fried chicken, beets and hard boiled eggs pickled together, olives, individual pies, gingerbread, ripe apricots.

These things, with the exception of the sandwiches, can be prepared the day before and require but a few moments for packing.

The bread for sandwiches is baked in old baking-powder cans, sliced very thin and spread with butter. Anything else desired may be used as filling; peanut butter, chopped raisins and nuts, pimento with cheese, lettuce, etc.

The individual pies are constructed after the usual method except that they are baked in muffin tins, and being small they can be packed away easier and are not so prone to break and lavish their juices upon everything else.

Any fresh fruit in season goes well for dessert, even the plebeian watermelon if thoroughly cooled and kept so by a wrapping of wet barley sacks.

I find for carrying lunches nothing

quite so satisfactory as a square tin cracker box. Its shape admits of close packing so the food does not shift and

Improved Preserving Methods

A Discovery of Great Interest to All Who Do Preserving

It has been conclusively shown through experiments conducted by both American and English manufacturers of high grade preserves, jams and jellies that the best results can be obtained in preserving if part corn syrup is substituted for all sugar. The natural flavor of the fruit is much more apparent, and a heavy syrup is obtained without the cloying sweetness of the all-sugar syrup.

This is particularly true in canning pears and other fruits having a delicate flavor. Most housewives desire a thick, heavy syrup; and in order to obtain this so much sugar is used that the canned or preserved pears have a cloying sweetness. This is also true of peaches, raspberries and many of the other more delicately flavored fruits.

The most satisfactory method is to add a good corn syrup to the sugar. For this purpose the best domestic science schools recommend the use of the brand of syrup known as Karo (Crystal White) and train their students in the proper blending of this syrup with sugar.

If you have never tried this ideal preserving syrup, order some Karo (Crystal White) from your grocer today, and ask for the little Karo book on preserving.

Care for the Eyes

As an eye remedy or an eye bath, Dr. Thompson's Eye Water has stood unequalled since 1795—one hundred and twenty years. Your mother and your grandmothers esteemed it as an indispensable household need. Do you? If not, you do not know the benefits your eyes would secure by using it regularly. Keep your eyes strong and healthy and they will help keep you. 25c at your druggist, or John L. Thompson, Sons & Co., 159 River-st., Troy, N. Y. Booklet free.

crush, and its tight cover keeps out the dust and prevents the lunch from becoming dry.

A large roll of waxed paper costs only five cents, so one can use it freely in packing, wrapping each article by itself.

Any small pasteboard box lined with the paper will hold pickles, salads or anything that is likely to communicate its flavor or juice to its neighbors.

If a bucket and drinking cups are to be taken along for water, it is well to put lemons and sugar in the lunch box, and it will take only a few minutes to serve lemonade.

The lunch, as it is here outlined, requires no dishes or spoons and so does away with the tiresome task of cleaning or packing away dirty dishes, and the paper napkins used do not suggest extra ironing on a hot day.

If your outing is to be a fishing excursion, you will of course take with you a frying pan, a sharp knife and a piece of bacon—and don't forget the matches.

Even if your picnic dinner is very plain and differs but little from everyday fare, the novelty of eating in the open and with different surroundings will give you a hearty appetite for any wholesome food.

Coffee Gingerbread—Beat well together two cups of sugar, one-third cup of butter and one egg. Add one-half cup each of molasses and strong coffee, a teaspoon each of ginger, cinnamon, and one-half teaspoon cloves, two cups of flour well sifted, with a teaspoon of soda and one-half teaspoon of salt.—Mrs. Floy Crosby Smith, Fair Oaks.

A PICNIC PARTY

"What's more fun than a picnic party, Vittles all on the ground,

Bugs in the butter, ants in the milk,

And 'skeeters a-buzzin' around?"

'Tis a good thing to acquire the picnic habit. A little money invested in some of the equipment, which makes the picnic meal still more attractive and easy to serve, benefits alike the weary mother, the tired business man and the fretful children.

Any receptacle will carry "good eats" from a 15-cent market basket to the fine leather hamper, costing many dollars. Paper napkins, plates, bowls, etc., are nice, but linen and even cheap muslin are best in the end.

White enameled ware is good economy.

Aluminum "flat silver" is so clean; it is not expensive, and very light to carry. Thermos bottles carry drinks best of all. Paraffine paper is a necessary article for wrapping sandwiches, etc., putting over the top of salad dish, butter, etc. It is a good plan to keep a can of the new fluid, solidified alcohol where you can get it when getting camping things ready. It will boil coffee, eggs, etc. Putting lid on can stops fire. In some places it is safer than a camp fire.

Suggestion for Menu—Whole wheat bread sliced and well wrapped. Good fresh butter, peanut butter, sliced cold pot roast, or other meat. Cake, crackers (in box), pickles, jelly, etc. Instant coffee, instant postum, egg lemonade.

Egg Lemonade—One large lemon, two eggs, absolutely fresh. Sugar to taste. Fresh cold water. Break eggs, separating whites from yolks. Beat white very stiff, beat yolks, to which add sugar, stir well. Add juice of lemon (strain out seed), now beat well again. Add whites and mix thoroughly. Pour into two glasses, fill with cold water and drink before the whites have time to rise.—Allan Corwin, Mesa.

AN EVENING PICNIC

We were all members of farmers' families and had worked hard all day in mid-summer. The thought occurred to us why not go to the nearby river for our evening meal. At 4 o'clock we were off, and in a little while had selected a beautiful shady spot on the grass in which to eat the contents of our well-filled baskets. One man had a boat and some went for a row, some to fish and swim. All promised to be back in an hour. At the appointed time they came and a fine mess of fish was prepared and fried on the fire the boys had made.

Coffee was also on the fire. A cloth was spread and the good things enjoyed to the utmost, for there

was no hot stove or kitchen and no dishes to wash. This especially appealed to the ladies. The hired men went too.

After supper we sat by the fire and told stories and sang the good old songs, and all voted it a jolly good time.

This was what we had in the basket: Chicken sandwiches, pimento sandwiches, egg and potato salad, chocolate cake, cookies, bread and butter, fried fish and hot coffee.

This is how we made the pimento sandwiches: Drain and mash fine one can of pimentos with a generous slice of grated cheese. Mix all together with mayonnaise dressing and put between thin slices of buttered bread.—Mrs. N. H. McAuslan, Princeton.

AN IDEAL MEAL IN CAMP

Instead of packing the picnic or camp basket with hard boiled eggs, sandwiches, cake and pickles, try this combination: One frying pan, one large pot, one coffee pot, a piece of lean bacon, flour, baking powder, butter in a tight jar, corn meal, sugar, salt and pepper, with a box of matches. This is the ideal picnic or camp dinner cooked over a bed of coals.

If you can get fresh fish wrap them in grape or sour dock leaves or in a corn husk, plaster them thickly with mud and push them away down beneath the fire, into a bed of hot ashes. Keep the fire going over them for an hour then pull out the lumps of dried mud and carefully break them apart and you will find a perfectly baked fish inside, which needs only butter, pepper and salt. Eggs are delicious cooked that way so also are potatoes. Pot pie, campfire biscuits are fine and can be baked in a kettle. Buy the necessary articles from the nearest farmer, such as milk, corn, chicken and other vegetables.—Mrs. Jenny Cummings, Turley, Okla.

FOR THE PICNIC

Picnics with us are numerous, and lunches have been varied. From the different menus I have selected the following toothsome things which are our favorites:

Bread and butter sandwiches, lettuce sandwiches in oiled paper, potato chips, olives, deviled eggs, bacon, beet salad, jelly, fruit salad made with gelatine, cake, coffee, lemonade.

Nothing is more appealing to the appetite out of doors than a generous supply of bacon, fried over the camp fire.

Here is a recipe for delicious potato chips which all pronounce "the best they ever ate."

Select large smooth potatoes and shave lengthwise, very thin, with a kraut cutter. Fry in hot fat a few at a time till light brown, drain on brown paper and salt.—Blanche Tiede, Santa Ana.

A GOOD LUNCH

I would suggest the following list for picnic: Cheese and pimento sandwiches, ripe olives, pickles, shrimp salad, potato cake, maple nut ice cream.

For one gallon maple nut ice cream: Two quarts fresh milk, two teacups sugar, one envelop Knox Gelatine, one quart cream, one jack frost tablet, four eggs, one 5-cent can condensed milk, one-fourth teaspoon mapleine, one teacup chopped walnut meats. Heat milk and gelatine. Do not boil, simply dissolve gelatine; strain through cheese cloth. Add cream, add jack frost tablet, which has been dissolved in one tablespoon water.

Let above ingredients set until they jelly, perhaps 15 or 20 minutes, then add four eggs well beaten, condensed milk, flavoring and nuts chopped. Turn into freezer, which has been packed, freeze and let ripen for two hours.—Isabel Delmers, Exeter.

GOOD THINGS FOR OUTING LUNCH

Ham and egg sandwiches, not baked beans, sweet pickles, olives, raisin bread and butter, marmalade, cake with ground nut frosting, cheese, hot coffee, lemonade, home-made fudge.

The beans and coffee may be kept hot if well wrapped in paper before leaving home.

Ham and egg sandwiches: Fifteen

(Continued on Page 95)

Gas Stove Convenience with Kerosene

Hot in Your Kitchen?

No need of it if you cook with a good oil stove. The heat is concentrated on the cooking—not radiated throughout the room.

New Perfection Oil Cook-Stove

For Best Results Use Pearl Oil

Abundant heat—always ready at the touch of a match—like gas. Can be turned out the minute you finish cooking. Cooks anything your wood or coal range does—and there's no heavy hods to lug—no dirt or ashes. No odor. Does not taint the food. Ask your dealer. See Exhibit, Palace of Manufactures, Panama-Pacific Exposition.

The Modern Idea

Get in touch with the world. Farm telephones help business, help farm life—save time and money. A few men in your neighborhood can get together and easily build a local telephone farm line.

The line is simple, easy to build
The telephone is easy to install
The cost is not excessive
The upkeep is small

Especially are these things true, when reliable, made-to-last telephones are used. Each man can buy his own telephone, then decide upon the cost of wire, poles and supplies. We will tell you the approximate cost, what material is needed and show you how to put up the line free.

Co-operative farm lines are not a new idea. They are being operated in many parts of the world now. Very many thousands of Kellogg telephones are installed today—many in service for eight or ten years in all parts of the United States.

Kellogg Telephones

Kellogg farm telephones save you money because they are practical and well built, do not get out of order easily, give unexcelled transmission which means that the bells ring properly, that you can hear and be heard clearly and distinctly.

Ask our practical telephone men at San Francisco for our illustrated bulletins that tell in a plain, understandable way how our telephones operate and why they save money.

We will send you these bulletins and help you build your line in any way that we can. Tell us what you want and the conditions under which you will build your line. Write for bulletin 24.

HAY

Under date of July 17, Scott, Magner & Miller say:

Arrivals of hay during the past six days have amounted to 4200 tons, which is an increase of over 1000 tons over last week's arrivals. Active loading by rail is steadily continuing and more of the new crop will be coming forward as the season advances. The main part of present arrivals has consisted of old crop. Harvesting is in active progress. Some new hay appears to be changing hands in the country although very little has yet been moved into our markets. The prices being realized appear to satisfy expectations of the farmers as they are much better than last season. This applies to good grades of hay. Alfalfa has continued to arrive in moderate quantities. At this time there is no particular demand.

Citrus Fruit Market

LOS ANGELES, July 21, 1915.

The orange market has fully maintained its former strong condition and is at this time giving to the growers good returns. At present rate of shipping the entire crop will be handled in good condition.

The lemon market is becoming more satisfactory. Weather conditions have changed in the East and the great mass of fruit on sidings and in warehouses is being cleaned up. Shipments are being resumed; at present about 40 cars are going forward daily. An increase of about a dollar per box is observed in prices during the past week, but as former prices were not sufficient to meet the freight, there is still opportunity for improvement.

Shipments

Shipments of oranges to date from Southern California since November 1, 29,804 cars, lemons 5,018, total 34,822. To same date last season: oranges 32,647, lemons 2,326, total 34,973. From Tulare County: oranges 5,648, lemons 202, total 5,850. To same date last season: oranges 5,875, lemons 30, total 5,905. From northern counties: oranges 630, lemons 2. To same date last season: oranges 404, lemons 5.

HONEY CROP

It is probable that the state over we will not produce this year much more than 50 per cent of a full honey crop. At orange blossoming time the heavy rains prevented bees doing full duty to the flow and in some of the sage sections of Europe the foul brood has made such inroads that the amount stored there will be very light.

Much time and vexation of spirit can be saved by carefully planning out every task before actually beginning it. To rush thoughtlessly into one's work is evidence of poor management. The most successful men are those who think things out pretty carefully beforehand, anticipate the difficulties and take steps to avoid them if possible.

Plans made some time ahead for buildings and other improvements will be worth much to the manager of the farm. By making plans early time, labor and money may be saved in building and buying needed buildings and other improvements.

CONCRETE ARBOR

(Continued from Page 75)

skill in laying up the boulders. The strength of cement makes up for the crudeness in work. In this case the arms of the "seat" were of large boulders projecting in such a way as to give most comfort. Of course,

while rough boulders answered for sides and back, the seat was made of sand and cement while over the surface before it had set was sprinkled dry cement, which was smoothed down, giving as attractive a surface as though a professional had done the work.

OUTING LUNCH

(Continued from Page 93)

cents' worth of cold-boiled, sliced ham and one or two hard boiled eggs. Boil the eggs 20 minutes that the yolks may be mealy. Put the ham through a meat grinder with a tiny piece of onion and the whites of the eggs. Mash the egg yolks into this, add a little pepper and salt if necessary, moisten with cream. Butter the slices of bread, spread one slice with prepared mustard, then with a layer of the meat mixture and lay on another slice of buttered bread, making a double sandwich and so on.—Mrs. F. A. Marks, Santa Ana.

A PICNIC LUNCH

The very best thing for a picnic lunch is brown bread and beans, for everyone is hungry. Of course, it needs the addition of pickles and fruit, with hot coffee.

To make the brown bread take one cup each of corn meal, graham and rye flour, one cup of syrup, two cups sour milk, one cup of raisins, one teaspoon each of salt and soda. Put in two tomato cans and set in water and boil three hours (cover carefully). When cold slice and butter and arrange sandwiches with pimientos.—C. E. M., Alta Loma.

DO AMERICANS LOVE FLOWERS?

(Continued from Page 80)

ple and the flowers lived together long before the botanist appeared, while here the botanists came with the early settlers to an unexplored field, found the new flowers and named them before the people had become familiarly acquainted with them. The state flower of California has been introduced to the children of that commonwealth as the eschscholtzia before they could spell it, but this does not prove any lack of love or admiration for it on their part. They have a pet name for the flower too; and in all the older settled parts of the country wherever a plant or flower is so abundant or useful or obtrusive that there is need to speak of it a name is found at once. The children of New England call the wild columbines meeting houses, from their shape, no doubt, and with them Viola pedata is the

horse violet, perhaps from its long face. The Houstonia, which is bluet in some places, is innocence in others. In northern New Jersey, the marsh marigold of other regions (Caltha palustris) is invariably a cowslip. Children gathering dog-tooth violets by the handful within sight of Trinity church spire, when asked the name of the flowers, expressed much surprise that the inquirer had never heard of yellow bells. Even shortia, which hid away from botanists for a hundred years, had a name which was common enough to answer every purpose, and the man who first discovered it in any quantity was told by the dwellers in the mountain hamlet, where it was spreading over acres, that it was nothing but little colt's-foot. Even where botanical names have not been adopted outright as common ones they have often been changed, just as pyxidanthra has become pyxie to all the dwellers among the New Jersey pines. There are plenty of common names in every locality which have never found their way into the botanies.

American women wear flowers for adornment more generally than the women of any other country. This of itself is proof of the genuineness of their love for flowers. It is absurd to imagine that a custom so universal is based on any sham or passing fashion. The desire for display is prevalent enough, beyond question, but if any one doubts whether the admiration for flowers is an acquired taste—because it is fashionable to wear them—let him carry a handful of them through a city street among groups of children where unsophisticated nature will find expression. The keen delight of these little ones, who will always accept such a gift, shows that the affection for flowers is an original instinct which is as strong in this country as it is anywhere. Fashionable freaks and follies pass away, and flowers would have their brief day like any other craze if the regard for them was artificial or fictitious. The flower dealers of the country need have no apprehension as to the future of their industry. It is based on one of the elementary wants of our nature. Flowers will be loved until the constitution of the human mind is radically changed.

DIFFERENT KINDS OF STEEL

Blister steel is made by causing the carbon of charcoal to penetrate iron in a heated state. German steel is blister steel rolled down into bars. Sheet steel is made by hammering blister steel. Double shear steel is made by cutting up blister steel and putting it together and hammering again. Crucible steel is made by melting in a pot blister steel and wrought iron or unwrought iron and charcoal and scrap. Bessemer steel is made by blowing air through cast iron, burning out the silicon and carbon. Open hearth steel is made by melting pig iron and mixing wrought iron or scrap steel, or iron ore to reduce the silicon and carbon.

One way to select good tool steel is to break a bar of steel and observe the grain, which should be fine and present a silvery look, with sometimes an exfoliated appearance. The best test of steel is to make a cold chisel from the bar to be tested, and when carefully tempered, try it upon wrought iron. The blows given will pretty correctly tell its tenacity and capability of holding temper. If it proves tough and serviceable take this temper as a guide, and temper your steel in like manner. Inferior steel is easily broken, and the fracture presents a dull even appearance.—S. I. Ross, Colorado Agricultural College,

Get Your Crop in on Time with a "Creeping Grip" Tractor

WHY let low, wet spots in your field set you back? Your time is limited—your crop must be started without delay if you want maximum yield when harvest time comes.

Here's the tractor that asks no favors of soft, wet ground. It can pull your plows through any ground that's worth working. The creepers do not sink or pack the soil—they cannot slip and lose power. They creep along over the ground, getting a firm grip and giving you maximum traction with the least weight on the soil, least consumption of fuel, and least wear and tear on the power plant.

The machine rides on steel rails on the endless track. The creepers oscillate over rough spots. Thus the power

plant is carried smoothly, free from jolts and vibration. The frame sets up on 3 points of suspension, which eliminates binding on the bearings.

No other power is as well suited for pulling your plows, harrows, seeders and combined harvesters. Let us tell you how you can cut your present cost of doing this work.

Write for Catalog

No other tractor is as carefully built as the "Creeping Grip." We put in it the best materials than can be produced. A demonstration will convince you. In writing please tell us how many acres you operate, so that we can suggest the best size suited for your work.

The Alameda San Jose, Cal.

simplified control

Simplified control—everything at the operator's finger-tips—so easy that a twelve-year-old boy can handle a Yuba Ball Tread Tractor as effectively as a man.

No need to throw all your weight onto a lever to shift gears or throw in the clutch. No snap and bang as the lever goes over. Every operation is performed quickly, quietly and easily as in a high-grade automobile.

Either the hand or foot throttle is used to regulate the speed of the motor. A set spark is used.

THE YUBA BALL TREAD TRACTOR

Only two sets of gears are used for speed—high and low. Gears are shifted by a handle on the transmission case directly in front of the seat.

Each tread is controlled independently. The levers on either side of the steering wheel send the tractor ahead when shoved forward. Pull them to the rear and the tractor is sent backward.

The Yuba Ball Tread Tractor steers as easily as an automobile. No worm gear is used.

It takes but a few minutes to learn how to operate it.

There is a booklet describing the rest of The Yuba Ball Tread Tractor.

Books

This list is prepared with the purpose of enabling our Cultivator readers to supply themselves with standard books at lowest possible prices. We call especial attention to a few of the new publications. "Citrus Fruits" by Professor Coit, of the University of California, covers all phases of the Citrus Industry under California conditions—the kind of a book we have had many calls for but never before been able to supply. "Productive Feeding of Farm Animals" by Woll, will command special attention. "Poultry for Profit" (The Cultivator Poultry Book) by Koethen, another California book, is new and excellent, telling what to do and what not to do with poultry in California; a sure guide to poultry success. The new Standard Encyclopedia of Horticulture, by Bailey, is not equalled by anything of the kind which has ever been published at any time in any language. Special terms of payment and discounts are offered by the publishers through us on this Encyclopedia. Write us about it.

LOS ANGELES: THURSDAY, JULY 29, 1915

One Dollar Yearly

The 46th State Fruit Growers Convention

California Fruit Growers Assembled in the Buildings of Stanford at Palo Alto
This Week, Dr. Cook Presiding, with Practical California Orchardists
and Experts and Several Noted Eastern Scientists on the Program

THE opening day of these state fruit growers' conventions tends to depress those who are anxious to see large attendance. It now appears that the attendance at the 46th convention will not be as great as that at Los Angeles last November. However, nearly all sections of the state are represented and it is expected that discussions and resolutions of a practical nature will make a most valuable week.

It is yet too early to predict the result of the effort to organize a great state federation of all agricultural interests. There are many who are heartily in favor of it, but it looks as if it would require much push on the part of the larger orchardists to perfect it.

Another week the Cultivator will be able to give more explicit information. As a foretaste we give this week extracts from a few of the addresses.

* * *

EELWORM PARASITES OF PLANTS

By Peter Frandsen, Professor of Biology, University of Nevada

Earth, rich in decaying organic matter, sometimes swarms with microscopic cylindrical worms, which, because of their wriggling movements, are known as eelworms. The most of these feed upon decaying substances and are probably beneficial in hastening the disintegration of animal and vegetable matter so that it may again be available for plant food. Certain forms have acquired the habit of entering the tissues of living plants, where they live as parasites causing more or less injury to their hosts. The parasitic species are distinguished from the non-parasitic by the possession of a minute spear which can be protruded from the mouth opening, enabling the animal to make its way into the roots and through the tissues of the plant.

Among the parasitic forms the one known as *Heterodera radiculicola* is becoming of increasing importance in this western country because of its wide distribution and the number of different kinds of cultivated plants that it attacks. We now have records of some 500 species of plants which are attacked, and these include the majority of truck garden crops, alfalfa, clovers, some grains, a number of fruit trees, ornamental plants, and a host of weeds. The presence of the parasite is indicated by the formation of swellings on the roots and underground stems, which somewhat resemble the root bacteria nodules but are more irregular in shape and size and stand out less sharply from the rest of the root. A heavily infested potato presents a characteristic appearance, one hard to describe but readily recognized with experience. Its surface is marked

by numerous pimples, small warts, creases and ridges. On cutting across the tuber one can see the mature females, somewhat pear-shaped, or circular in cross section, about one-twenty-fifth of an inch in diameter, of a grayish white color, and marked off from the tissues of the potato by a brownish ring. The appearance of a heavily infested potato is not attractive to the housekeeper and diminishes its selling value. There is considerable loss of substance in paring as the worms may penetrate to a depth of a quarter of an inch, and the keeping qualities appear to be lessened.

Each mature female is little more than a sac containing from 300 to 500 eggs which may undergo development inside her body. As the eggs enlarge, some of them are extruded. In from 20 to 28 days the eggs hatch and the minute larvae, one-seventieth of an inch long, emerge and, aided by the decay of the tuber or roots in the soil, eventually make their way into the ground and move about until they find a suitable root which is entered, as a rule, from the tip. We have found that they also enter the young potato tubers by way of the lenticels, or breathing pores. Several worms usually enter the same spot. After repeated moultings the larvae transform into mature males and females. The former are elongated and cylindrical in shape while the latter become pear-shaped. Mating occurs within the plant substance and the male then dies. It requires about a month for the larvae to mature, and the whole life history occupies from seven to eight weeks.

The worms are distributed from one section to another by infected seed potatoes, transplanted seedlings, nursery stock and the like. Irrigation is one of the most important methods of carrying the worm from one field to another and one of the most difficult to control. Farming implements may transfer worms by means of the adhering soil, but our experiments show that if the soil is thoroughly dried out all the worms are killed, so there is probably very little danger from the drifting of soil by the wind. Some experiments were carried on to test the possibility of spreading the parasite by means of the manure of animals fed upon infested plants, and it was found that all eggs and larvae were destroyed in the stomach by the gastric juice.

The eggs and larvae are quite resistant to frost, but freezing temperatures for a sufficient length of time will kill them. The long, cold winters of the northern and eastern states are probably the chief cause of the absence of any eelworm problem outside of the greenhouses. The character and consistency of the soil plays

some part in the degree of resistance to frost. We are now at work to determine the depth to which the worms may penetrate different soils.

It has been suggested that fields might be rid of the worms by flooding them with water, but our experiments indicate that at least three months' submersion would be necessary to make this method effective.

On the other hand we have found a surprising lack of resistance to drying. Eggs and larvae placed on a glass slide and allowed to dry out for a few minutes fail to show any signs of further development, and if infected roots and tubers are allowed to thoroughly dry out all the contained eggs and larvae are killed.

There is also very little resistance to heat. Some eggs and larvae were placed in an incubator at a temperature of 40 degrees Centigrade, with the idea of hastening their development. While development was greatly accelerated in the first few hours to the extent that some of the eggs began hatching before the embryos had reached the proper stage of development, at the end of 18 hours every egg and larva was dead. Infested potato tubers were likewise placed in the incubator at various temperatures for varying periods of time, and it was found that 23 hours was sufficient to destroy the parasites without apparently interfering with the germinating power of the potato. A longer period of exposure than this impaired or destroyed the germinating power. Since it is difficult to be sure of one's seed if it comes from an eelworm locality, because a slight infestation may easily escape even careful inspection, it is possible that such seed may be made innocuous by placing it in an oven for 24 hours at a temperature of 40 degrees Centigrade before planting. We are now testing this out.

A question frequently asked by the farmer is: "Can't we treat the seed and soil with some chemical substance which will rid them of the worms?" Previous investigators have found that liberal treatment of the soil with alkaline fertilizers seems to be unfavorable to the worms but cannot be counted upon to exterminate them. One Nevada rancher claimed that he had a method of applying bluestone, which kept the eelworms from bothering him. We treated worms and infested plants with various strengths of copper sulphate solution and found that even a one per cent solution, which is distinctly poisonous to vegetation, acting for two days directly on the worms, failed to destroy a single egg. The formalin treatment for scab had no appreciable effect on the vitality of the worms in the tubers. We are now carrying on experiments with

other substances but so far have found nothing which appears feasible as an exterminator.

The practical farmer is not so much interested in the scientific details of our studies on the effects of the parasite on its host or the peculiarities of its life history and habits as he is in remedial measures. In the light of our present knowledge, with particular reference to the potato, these may be summarized as follows:

Selection of potato seed from localities known to be free from the parasite.

Planting potato crops in non-infested ground.

Summer fallowing of infested ground, keeping it free from weeds. It is not yet known exactly how long the worms can live in soil kept free from food plants, but the indications are that one season will starve them out.

Deep plowing, preceding a period of hot dry weather, so that the soil is well exposed to the heat of the sun and becomes thoroughly dried out.

Rotation of crops. The following plants are recommended by men in the United States department of agriculture for use in crop rotation as immune or only slightly susceptible to the eelworms: Barley, beggarweed, Brabham cowpea, broom-corn millet, corn, crab-grass, iron cowpea, peanut, pearl millet, redbot, rye, sorghum, timothy, velvet bean, wheat, winter oats. We have succeeded in getting a marked infestation of corn and oats, but even if these crops are not wholly immune they may serve the purpose of greatly reducing the number of worms.

THE FUTURE OF THE WALNUT INDUSTRY

By J. B. Neff

The early plantings of walnut trees were altogether of seedlings, first hardshells and then softshells, and the orchards were usually left without much care, the owners being content to take whatever crop was produced and market it at the nearest town for any price that was offered. Then came the planting of commercial orchards when more care was given to the selection of land suitable for the growth of the trees.

Selection of trees was not definitely undertaken and seedlings were still planted but of the softshell variety. The methods of marketing were improved to some extent by the organization of associations to prepare the walnuts and collect them into large lots where better prices could be obtained. Grades according to size were established but were not uniform throughout all the associations, as at present, neither was there a uniform method of bleaching as practiced at present.

Don't Plant CITRUS TREES

until you can meet the five essential requirements of success. Here they are: Sufficient Water Supply; Quality Trees; Safe Thermal Conditions; Good Care; Good Soil.

These five things are fundamental and he who ignores any one of the five invites failure.

Good fruiting trees are good revenue producers, and if you have the requisite water, location and soil—true citrus land—you cannot afford to miss the opportunity to

Plant Citrus Trees

Place your order NOW for Spring delivery. You will perhaps never have another chance to buy **QUALITY TREES** at so reasonable a price. Even the so-called **CHEAP TREES** which might better be called **EXPENSIVE TREES** by the man who expects to receive an adequate return on his investment, are quoted the same or very little less. We were founded twenty-five years ago, and have been improving the grade ever since. Buy **TEAGUE QUALITY TREES**, embodying vigor and symmetry of root, body and top—and in the selection of buds, which will not only be true-to-name in the general acceptance of the term, but true to the best type of the varieties to which they belong as well.

Write today for prices and particulars. No orders too large or too small to fill. All correspondence promptly answered.

Our booklet "CITRUS CULTURE" sent to any address on receipt of 25c.

San Dimas Citrus Nurseries, Inc.

Citrus Trees Exclusively

San Dimas, Cal.

Quick—Nitrogen

is obtained by using strong, active, virile nitrogen-producing bacteria that come in **FARMOGERM** to inoculate your cover crop or alfalfa seed. Extensive government experiments reported an average deposit of 122 lbs. of nitrogen per acre by well-inoculated legumes, besides that taken off in the crop, (equivalent to 1000 lbs. of nitrate of soda), and the Experiment Stations in sixteen States testify that **FARMOGERM** is a most successful inoculation.

The Standard Inoculation

FARMOGERM

High-Bred Nitrogen Gathering Bacteria.

is a moist, jelly-like substance, containing billions of nitrogen-gathering bacteria. It is put up in a patent bottle which keeps the jelly (containing bacteria food) moist at all times.

Bacteria cannot live long in cotton wads, granular media, or in any other dry state. The nitrogen-gathering bacteria live for years in the moist jelly-like media of Farmogerm.

Results Guaranteed

Prices: 1 Acre, \$2.00; 5 Acres, \$6.00; 50 Acres, \$55.00.

Our inoculation experts will gladly give detailed information regarding inoculation with **FARMOGERM**.

LOS ANGELES, CALIFORNIA

Improved methods of managing walnut orchards are gradually coming into use though but little has, comparatively speaking, been done in the scientific selection of varieties best suited to certain localities, or the investigation of diseases with a view to their prevention.

However, the small amount of work which has been done is returning large amounts on the investment and will be an incentive to still further research and experimentation. Planters are now asking for grafted or budded trees of known varieties and marketing methods have taken a long step forward. The University of California has lately undertaken investigations bearing the same relation to the walnut industry that the experiment station work has borne to the citrus industry.

This is promised to be a permanent undertaking and should produce valuable results though investigations of this character are necessarily slow in results since a walnut tree must be under observation for at least 15 years to determine its commercial value.

The industry is however making substantial progress, and the progress will be much more rapid in the succeeding years as the newer varieties become better known and the marketing methods become better developed so as to reach a larger part of those who would be glad to eat California walnuts. When we remember that a crop of California walnuts, amounting to 15,000 tons, which is more than we have produced, will furnish but one-third of a pound, or only about 13 walnuts to each person in the United States, we can readily see there is small likelihood of overproduction if we will use diligence in distribution and care in preparing the walnuts for market.

THE FUTURE OF THE ORANGE, AS I SEE IT

By J. H. Reed

In a recent address President Wilson made this assertion: "No man who does not see visions will ever realize any hopes or undertake any great enterprise."

I am neither a prophet nor the son of a prophet, but I have some pronounced visions concerning the future of the orange industry in California. It is said that the best way to preserve one's confidence in progress is to look back, not over a few months but over a period of years. My 25 years as an orange grower, and a somewhat careful student of the industry, possibly give me some advantage in forming opinions as to what may be expected of it in the years to come.

I frankly say that I have optimistic views, and proceed to give reasons for them. It must be understood I do not speak of any given period but of the somewhat indefinite future of a great permanent industry.

At the outset you will allow me to say that I think it generally settled that the future profit of orange growing depends largely on an improved quality of fruit and a lessened cost of production. We must be able to sell an inviting product at a price to encourage such increased consumption as will readily take the greatly increased product now in sight. That briefly is the task set us. In accomplishing it, as I believe we shall, first in my vision I see orange growing becoming more of a profession, that is, a vocation in which a knowledge of science is used. At present a large portion of growers depend on the rule

of thumb. The average orange grower of the future will be as scientific in his profession as the engineer or the manufacturer in his. Again, a few years ago, because of the attractiveness of the business, a large acreage came into the possession of non-residents who managed it by proxy. In the future I see the orange groves, as a rule, owned by growers trained to the business, carried on by their own hands or directly under their supervision.

In my vision I see the newly established experiment station, a tremendous force in developing the industry along new and important lines. Its great influence is already indicated by the frequent visits of large delegations of growers from distant sections to the original Riverside station where the limited field experiments under process for several years are now ex-

J. H. Reed.

hibiting definite results. When the several hundred acres of the new grounds are covered with experimental tests including every unsettled cultural question in producing citrus fruits, the favorable bearing this will have on the future prosperity of the industry is difficult to realize. It is confidently believed that orchardists will very generally avail themselves of the practical results of completed experiments. The practical experiments in irrigation, cultivation, fertilization, pruning, etc., in the 20-acre old, bad conditioned grove the management is just entering on, alone must result in most valuable object lessons to owners of old groves.

One result I confidently look for, the re-establishment of the neighborhood horticultural clubs so popular and useful a few years ago. It will not be enough to read reports and listen to addresses of the specialists or even visit the experiment grounds. Discussion of it all, and even suggestions for new work for the station managers to undertake, will be taken up by these local organizations.

Mr. Shamel's Work

Probably the most important single investigation to affect the future of the industry is that undertaken by the federal department of agriculture in charge of Mr. A. D. Shamel.

It has been demonstrated that from ten to 40 per cent of trees in our bearing orchards produce fruit either inferior in quality or unprofitable in quantity per tree. This heretofore has been considered unavoidable. Mr.

P For Every Purpose
I NEW Threads and Couplings
P Hot Asphaltum Lipped
E 2nd Hand and NEW
P Screw Casing Fittings and Valves
E Guaranteed for Pressure

Pacific Pipe Co.

Main and Howard Sts.,
San Francisco

Shamel has been at work along an entirely new line of pomological investigation, and now after six years of much careful and intelligent effort is prepared to demonstrate that both causes of these great losses to growers are avoidable.

Instead of seeking new or improved varieties the object has been to find means of preserving the varieties that have proven satisfactory and adapted to our conditions. It was found that by propagating through bud sports such desirable varieties as the Washington Navel, Lisbon Lemon, and others, were rapidly deteriorating through producing inferior types. It is now demonstrated that by proper budding the true, normal type of these desirable varieties may be preserved and the product kept to the standard, both as to character of fruit and quantity. Granting this, it is difficult to fully comprehend how vastly the possibilities of our orchards have been increased. Of course the possibility of improving the orchards now bearing is the immediate important result of the investigation, but the possibility of building new orchards with the assurance they will not have to be rebuilt is even the greater acquisition from the investigation.

Application of Water

A few words on two other considerations. I cannot think the best manner of applying water has yet been devised. You are familiar with the results of the federal department's exhaustive tests showing that but about 25 per cent of the water provided for irrigation actually serves its purpose. Of course but part of the 75 per cent of loss occurs in the orchards, but the furrow system is exceedingly wasteful. The evaporation from water while running, from the saturated surface after the water is off, and the entire loss from the few inches of surface earth afterwards turned up to protect that below, leaves but a fraction of the

amount applied for actual service. Whether we are to learn a practical lesson from the natural mulching in forests, where there is such tremendous growth indefinitely sustained, is yet to be shown. The Chases of the National Orange Company of Riverside are now experimenting on several hundred acres with artificial mulching, and Dr. Webber on small plots. If practical mulching is found successful, the saving in water and labor in cultivation will go a long way towards lessening cost of production.

Traction Power

I believe the time is near when the leading orchard expense, the traction power required for manipulating the soil and moving materials and products, is to be largely reduced by the use of the modern motor which has already revolutionized traction service on the roads by taking the place of animal power. It is already being used successfully in orchards of large areas. Mr. Ford's proposition to produce a tractive power at the cost of a good horse, making it economical for small growers, merits attention because of his wonderfully successful practical achievements in other directions.

The limit of time allows me but these few considerations among the many that bear directly on the subject but, as I see it, these alone are quite sufficient to promise a prosperous future for the great orange industry.

NURSERY BUSINESS FOR WOMEN

Mrs. Lucy Sexton of Goleta, Santa Barbara County, addressed the convention on Growing Nursery Stock as a Business for Women. From her address we give the following:

You can count on the fingers of one hand successful women nursery owners who have been in California for the last 40 years. Of these two were left well established businesses by the death of their husbands; a very

few have established nurseries of their own which have developed into reliable or dependable enterprises. There are many women who handle nursery stock and flowers which have been produced by the professional nurseryman. In fact, every large town has its women selling plants and flowers, and of course in these cases part of the stock is grown at home. Many who have not achieved any great financial success have yet attained success in one feature, that of restored health through the healthful work which the nursery business has forced them into. There is possibly an opening for the nursery woman in growing some special crop, something for which she has a particular adaptability. For instance, one might grow poinsettias to perfection, another petunias, others seeds, bulbs, cut flowers, ferns, etc.

As a rule the woman is not fitted for handling a large and complete nursery business. I would not discourage any woman but think a woman entering this business should keep in reserve part of her funds until she learns from experience how far she can venture. Many failures have been the result of women rushing into work for which they are not qualified. For instance, for many years we have observed nursery people clearing off the oaks from the fields and starting nursery stock without apparently understanding that almost any tree planted on such ground will die because of the oak root fungus with which the soil is infected. There is no use trying to do the impossible. To be successful in the nursery business a woman must have foresight regarding market requirements and as to what the fads in planting will be—the fad of one section may not receive any attention whatever in another. Surely a woman may be fitted for taking orders and selling stock for the professional who has the ability to produce fine goods. In the meantime she could with glass or lath house en-

ter gradually into the business, this feature of the business being more like housekeeping than the rough, outdoor work.

SCHOOL OF FUMIGATION

Prof. C. W. Woodworth of the state university is in Southern California arranging for a school of fumigation covering the week of Monday, August 8, till Friday, August 13. As this page goes to press we do not have the full program in hand but hope to have it in time for it to appear on page 119.

In general, we may say that such topics as tent leakage, chemistry of materials used, dosage, physical effects of the gas, physical qualities of the gas, absorption of cyanogen by the soil, cyanide injury to the leaves, measuring capacity of tents, testing cloth for strength, and, in fact, everything of interest to practical fumigators will be discussed. There will not only be opportunity for discussion, but for laboratory and field demonstration.

The school should bring together a large number of practical fumigators and orchardists interested in fumigation and will induce a full discussion of best and most economical methods of work.

GROWERS' MEETINGS

R. S. Vaile, assistant professor of orchard management of the citrus experiment station of the University of California, announces that the following growers' meetings have been arranged by the citrus experiment station in conjunction with committees of local orchardists and packing house managers. The entire local community is invited to be present in each case:

Choice Lemon Land

In the East Whittier frostless belt. Lemons and Valencia Oranges netting an average of \$500 to \$600 an acre yearly. Get best location now, at low opening price. INVESTIGATE TODAY. CHAS. J. CLAUSSEN, 602 Haas Bldg. Los Angeles

Kill the Scale

CITRUS TREES CANNOT produce GOOD CROPS of SOUND MERCHANTABLE FRUIT while SUPPORTING CROPS of SCALE (Coccus Citricola or any other kind.)

CLEAN UP THE GROVES

The CLEANED trees, in GRATEFUL APPRECIATION, WILL produce fruit in ABUNDANCE of a QUALITY that will GIVE the GROWER JOY and FILL his POCKETS with GOLD.

FUMIGATION WITH HYDROCYANIC ACID GAS

will CORRECTLY CLEAN Citrus Trees (no other known method will.) NOT EXPERIMENTAL but a PROVED SUCCESS. TWENTY-FIVE YEARS of practical experience has PROVEN the VALUE OF FUMIGATION; ask any successful citrus fruit grower in Southern California.

Mr. Hemphill, manager for C. C. Chapman, Fullerton, Cal., said: "Correct fumigation spells clean trees, more and better fruit, highest prices in the market, and larger returns for the grower."

Mr. O. B. Griffin, assistant manager Leffingwell ranch, Whittier, Cal., said: "The fumigation of citrus trees is a profitable investment for the citrus fruit grower, and properly done will bring large returns."

COOPERATIVE ADVERTISING

Written for the California Cultivator
By J. G. Berneike

ROME was not built in a day. The present wasteful system of marketing or distribution cannot be changed in a day. While we are waiting patiently or impatiently for this change that is sure to come about because of the demand for it by intelligent and ex-

and nut grower and a cooperator. With one hand I raise walnuts, with the other hand I raise apricots. Why should not my right hand help my left hand, and vice versa? Why should not I, a walnut grower, help to advertise my dried apricots? Why should not I, an apricot grower, help to advertise my walnuts? Are my interests as a walnut grower and as an apricot grower antagonistic or identical? The

San Joaquin River in San Joaquin County.

ploited growers, we may as well see what methods we can employ to help ourselves to better returns.

In a recent issue of the California Cultivator appeared an illustrated article, showing the window package of the walnut growers which will be put out this year and which, I think, is a most promising move in the right direction. Each package that goes into a home will be an advertisement of the walnuts of some thousands of California walnut growers. Cooperation among them has made this possible. And the cost of this advertising? It is only the difference in the cost of a plain gray package and the fancy colored and lettered package, that is to say, it is a very small item. But it serves the purpose, and of course it is paid for by the consumer. This package goes into the home and the kitchen, and until the nuts are all used up it is a constant reminder of Diamond Brand California Walnuts. The manager of the California Walnut Growers' Association expects these packages to go out by the million, and already there is active inquiry for them.

Here is the thought: I am a fruit

latter, of course. Therefore—well, you can see what follows.

The only thing that remains is to go to work at it at once. Why not have a convention of representatives of the different exchanges or associations work out the best method of cooperation in advertising our California products marketed by the various cooperative associations in package form.

The California Walnut Growers' Association, the California Cured Fruit Exchange, the Almond Growers' Exchange and others may well work together, because the interests of the growers that make them up are interlocked and identical. The outside of the package, or as was suggested by the manager of the Walnut Growers' Association, a small recipe booklet inside of the package might be used to advertise the goods of the other associations. The walnut growers put into their package a small recipe book. On the last outside page it could advertise the goods of other associations. The dried fruit and almond growers would do a similar thing for the walnut growers.

If not, why not,

THE WALNUT OUTLOOK

Writing to the Santa Ana Blade as to condition of the coming walnut crop Mr. J. G. Berneike of Orange County writes:

The blight has been making a serious inroad on the promised crop, but there is to all appearances a good crop left on most trees. However, there will be more dropping for the next few weeks with a gradual diminution toward harvest time. Many of the fallen nuts show no black spot, but on splitting them open it is seen that the blight entered at the blossom end, destroyed the vitality of the nut and allowed it to drop. How many more of this description there are on the trees we cannot tell, but most of them are likely to drop within a few more weeks. Under some trees half of the crop seems to be on the ground, and yet a very good crop seems to remain on the tree. Some orchards show blight much worse than others; the same is true of adjoining trees in the same orchard.

Orange County seems to be entirely free of the aphid pest this year, and this fact will go a long way to insure good quality nuts. The difference in the damage done by the blight and that done by the aphids seems to be this: The blight reduces the size of the crop, but quality remains good. The aphids spoil the quality of all the nuts, but the size of the crop is not greatly reduced. Even a hot day, unless it comes rather early in the season, does not affect quality as much as the aphids do. This was quite evident in 1913.

In the case of blight every nut not affected by it is of A1 quality, but in the case of the aphid attack the quality of every nut is reduced because the vitality of the whole tree is attacked, and because practically every nut on the tree becomes covered with honey dew, then with dust and fungus, producing a black heat-absorbing surface. Every day the nut is slightly cooked by the heat on the black side until it is seen at the end of the season that the black side did not develop properly; the shell is flattened, the meat shrunken and darkened.

Judging from the size and hardness of the nuts today they promise early maturity which will help out in marketing for the Thanksgiving and Christmas trade. They will be well ahead of the importation of French and Italian nuts. How this importation will affect the market and the price is somewhat problematical.

Last year France laid an embargo on the exportation of walnuts, but removed it later on. It was reported that they proved to be of very inferior quality, and that they were offered at a low price. The lack of sufficient of skilled harvest hands probably accounts, more or less, for inferior quality. On account of the war some good European customers for French and Italian walnuts are cut off, and the probability is that the United States will be made the dumping ground. The quality is again likely to suffer. The price, therefore, is likely to be low, but in the long run California walnuts, if the quality proves good, will all find a good market at a fair price before the next season comes. Growers will have to learn to be patient for returns if they wish to receive a good price. Otherwise they must sell their nuts at a low price in competition with the imported nuts.

Associations intend to take even more pains in grading for quality than heretofore. The idea is to give California walnuts the highest standing in the market.

The central association will have a walnut cracker in Los Angeles to take care of culls and off-grade nuts. This certainly looks like a wise move which the growers can heartily endorse. The writer advocated a move of this kind two or three years ago through the public press, and he certainly feels gratified to see the move carried out in an improved form. Three grades of walnut meats will be made. The details of this deal will, no doubt, be communicated to the association members in due season.

Last year was productive of very large-sized walnuts, this year will prove quite otherwise. The writer's orchard last year turned out 30 per cent of Jumbos, but this year will probably not reach 5 per cent. The Number Two size will greatly predominate, while the clusters of four, five and more will produce Number Twos. Many orchards are likely to show a large percentage of the latter. It is reported that Ventura County will run heavily to Number Twos.

The packing house of the Santa Ana Valley Walnut Growers' Association is being remodeled in order to take care of the larger crop which is expected. Since there has been an increase of membership, and since the acreage has increased considerably in Orange County, both the association and the county may look forward to the largest output ever harvested, unless, of course, present indications do not continue to hold good.

The walnut trees certainly never looked thriftier than they do this year. There has been plenty of moisture to develop the nuts and to promote vigorous growth of the trees.

SEBASTOPOL APPLE SHOW

The date of the opening of Sebastopol's sixth apple show is August 14, and interest in this annual exposition of the famous products of the Gold Ridge section is increasing at a rate that is intensely pleasing to the management.

The prize list will be ready for distribution soon. Many cups and cash donations have been received and altogether the prize offerings will be greater than ever.

ATTRACTIVE PACKAGES AND PACK

While quality is an essential requirement in the marketing of any farm and fruit product, it is by no means the only factor in selling at the highest price.

First of all the package used should be new and clean. The neater the package, the better the fruit will appear. While the products packed should be of uniform size and color throughout the package, the top layer should be arranged so as to attract the eye of the buyer. Further the package should in every instance be well filled. The buyer is very quick to notice shortness in measure, or any deficiency in a well topped or rounded finish. In small fruit, such as the strawberry, particular attention should be given to have every berry in perfect condition, with the calyx or hull attached. The individual fruits should not be arranged in layers in the box nor should the top be arranged to show a uniform red color, but rather, the calyx should show in with the red. For the best effect, and for particular markets where the grower has steady customers, the berries should be graded into two sizes. This is to give uniformity to the fruit and will make the package more attractive.

It is a well known fact that the

attractiveness of a package of fruit sells it. The customers are attracted through the eye, and everything that aids in making the package attractive will increase the value of the fruit and ease in selling.

It does not pay to pick inferior fruit with good fruits, for it invariably works against the reputation of the grower. Too little attention to uniformity in pack and grading will often result in a loss to the grower.—E. P. Sandsten, Colorado Agricultural College.

RAT ELIMINATION IN GERMANY

Owing to the very efficient method adopted for their destruction, few rats exist in Germany. As soon as they appear in a building or other place, if ordinary methods fail the police are notified of their existence, and at once an official is detailed to exterminate the rodents. So closely is the matter followed until the effort is successful that rats are seldom seen. No charge is made for the services of the official rat catcher. As a consequence there is little or no market for rat exterminators in Germany.

HOT WEATHER BUNGALOW

Here are a couple of views of an Imperial Valley bungalow which gives the maximum of comfort. The interior is of the porch open on three sides, together with large open living room running entirely through the center of the house. This gives a sweep of the air from every direction. The interior view shows how the screens are lowered when it is desired to keep out the wind or rain. They are hinged at the top and swung

at will to aid in extending the shade of the room.

The gentleman standing at the outside of the house is Mr. Tom O'Neil, whose place is two miles north of the town of Imperial. His home is not only made comfortable by the shade afforded by these large porches, but in addition he has acetylene gas and hot and cold water. There is no reason why the farm home should not have all the comforts offered by the city home.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Age of Majority

Can a girl over 18 years; but under 21, make a valid and binding deed to real estate in this state? A minor makes a deed to real property and dies before becoming of age. Would that deed be good or could it be set aside by his or her heirs?

In this state a girl arrives at her majority at 18 and therefore has all the rights of any other person of majority; therefore her deed would be perfectly valid and binding. The deed of a minor who has died before attaining majority can be disaffirmed by his heirs or personal representatives within reasonable time after the death of said minor. In case the minor is over the age of 18 the consideration for the contract must be restored to the party from whom it was received.

Broken Shaft

I cracked the crank shaft in my pump engine and got a mechanic to weld it. He guaranteed to use Crupp-

crown nickel steel in so doing and to make the shaft stronger than ever for the sum of \$25. I paid him on completion of the job. Six or eight days after it broke in the same place and through the material he put in. I am told by another mechanic the material he used was not the above stated. He refuses to refund the money or in any other way make good. What recourse have I? Could he be prosecuted as a fraud? Can I hold him for the value of the crankshaft less the cost of repair? I was obliged to put in a new one at an expense of \$200.—Subscriber, Pomona.

A mechanic is liable for the breach of his warranty, and you should be able to recover from him the amount of money you have paid to him and also value of the use of your engine during the time that you were deprived of its use. There is no criminal fraud evident.

Squirrel Pest

The pest of squirrels about my place is intolerable and I would like to know how to proceed to get my neighbors to clean up. Have appealed to county horticultural commissioner and he says it is not in his province. Kindly tell me how to proceed to secure abatement of this nuisance under

the state law controlling the pest.—Subscriber, San Gabriel.

There are laws applying to many of the counties throughout the state, making it obligatory upon the owners of property to set out the poison for the squirrels upon their premises. There was formerly such a law applying to Los Angeles County, but it has been repealed. There is a general law covering the squirrel nuisance in Act 3259, approved March 13th, 1909, Statutes of 1909, Page 311, which provides that the board of supervisors of each county may by resolution determine that it is necessary to destroy the rodents in such county and appropriate monies of the county for the employment of health inspectors and purchase the poison to further this work. If any person owning lands or properties infested with rodents fails and refuses to exterminate them, the inspectors may proceed, the cost of such action by the inspectors being charged and made a lien against the property.

Riparian Right

I have been pumping water for irrigation out of a river for about four years. This river runs through my land for about one mile and is all under fence. I would like to find out if it is necessary for me to file a water right and if so, how many inches of water would that give me?—Subscriber, Linne.

You are a riparian proprietor and are entitled to have the ordinary flow

of the creek come to your lands, and you are further entitled to use such waters flowing in this stream as may be necessary for domestic use and for the irrigation of your lands adjoining the stream. It is therefore unnecessary for you to file a water appropriation.

MAKE MONEY OUT OF JIMSON WEED LEAVES

It is amusing to note that the leaves of Jimson Weed, owing to the European war, now command a value. Any school boy in California can make \$2.00 to \$3.00 a day picking the green leaves. The Haas Seed Co., No. 1800 Lincoln Avenue, are paying 1½ cents a pound for the fresh green leaves. All you have to do is ship them in a clean grain sack to the concern and get your money by return mail. They pay the freight. Any quantity shipped providing it is not less than 25 pounds will be received by them and paid for. Now is the time to pick them when they are in blossom.

Write for instructions how to pick and ship them to the Haas Seed Co., 1800 Lincoln Ave., Pasadena, Cal.—Adv.

Farm Adviser Parker of Ventura County has purchased a stereopticon to illustrate his talks to the farmers.

Irrigation

Forestry

ECONOMICAL USE OF WATER

 In the sandy soils of the Umatilla reclamation project in Oregon it is necessary to handle irrigation water very carefully in order to get the greatest benefit. Many tests were made on the project experiment farm located at Hermiston, Oregon, last year, to determine the most economical methods of handling irrigation water. The specialists in charge of this work lay emphasis on the use of short irrigation furrows, ranging from 100 to 200 feet in length, and 20 to 30 inches apart, using fairly shallow, well-opened furrows to facilitate the flow of water. They also advocate that water should be run for only a short time in one place, as loss soon occurs from deep percolation. Since the storage capacity of this soil is very low, only a small amount of water should be used for each irrigation, and frequent applications made to maintain an adequate supply for plant growth. Best results were obtained by using a comparatively large stream of water while irrigating, in order to cover the land as quickly as possible.

On virgin land without crops it was found that a two and one-half inch application of water was retained in the first four feet of soil; five inches of water, applied under identical conditions, filled the first ten feet to its full carrying capacity, and part of the water passed even below this depth. A two and one-half-inch application really does as much benefit to the crop as a five or ten-inch application. After five and ten-inch applications of water were made to two plats having the same kind of soil, there remained an equal quantity of water in each plat to a depth of four feet, and this quantity was practically the same as was retained by the same layer of soil where a two and one-half-inch irrigation was applied.

Where the land was of finer texture than in the above experiment, and bearing a crop of alfalfa, a four-inch application of water was all held in the upper four feet. This shows that in either case, heavy losses result from applying heavy irrigations to the lighter soils.

The frequency of applying water has a very marked influence upon crop yields. An area of alfalfa given 4.4 feet of water in eight applications yielded four tons of hay per acre or 0.92 tons per acre-foot of water used. Another plat given 5.3 acre-feet applied in 12 irrigations, yielded 5.3 tons per acre, or 1.02 tons per acre-foot of water. The results obtained by applying water at this rate were better than when heavier applications of water, such as 9.7 acre-feet applied in 24 irrigations were employed. The excess of water and the additional labor were not justified by the slight increase in yield resulting from the heavier applications of water.

The careful irrigator who has his distribution system, furrows, head ditches, and time properly arranged to enable him to apply just the quantity required to fill the soil to the depth of root penetration, gets a maximum benefit from the water. On the other hand, the irrigator who uses more wa-

ter at a time than his soil is capable of holding, loses by deep percolation, all of it that is not held within the root zone of his crop, and furthermore, he may damage adjacent land by contributing to the underground seepage.

* * *

If California alfalfa growers secured only .92 of a ton for each acre-foot of water they would be discouraged indeed.

COOPERATES TO PREVENT FIRES

The post office department has just repeated in the current postal guide supplement the instructions through which rural carriers are to report forest fires to the proper authorities during the coming season. These instructions were first issued in May, 1912, and during the past two years the cooperation has resulted in the detection and suppression of many fires.

State and federal forest officers will make a special effort this year to get even more value out of the service than has been obtained heretofore. The usual procedure has been for the state fire wardens or federal forest officers to send to the postmasters lists of local wardens and patrolmen, with their addresses and telephone numbers. These lists are given to the carriers with instructions to report forest fires to men whose names appear thereon, or to other responsible persons. This year a special effort will be made to follow up the sending out of the lists by having the patrolmen and wardens meet the carriers personally and to take the initiative in arranging such meetings, and also to map out a plan of action to be followed.

Cooperation between the rural carriers and the federal forest officers will be effective in the 20 states in which national forests exist and with state forest officers in the 20 states which have established their own fire protective systems. It is expected that the services of the carriers will be particularly valuable in helping to protect the new national forest areas in the southern Appalachians.

PROTECT THE FORESTS

Protected forests increase in value. They furnish labor, develop the country, promote the stock raising industry, keep down lumber prices, keep the streams running, afford recreation, fishing, hunting, make a region beautiful, make homes safe and comfortable, make life worth living and a prosperous state, inhabited with contented and industrious people.

The forest service is working to protect the forests, and we ask you as a forest user to lend a helping hand. We need your assistance and cooperation to help in keeping fire from getting started. Will you help? Will you be careful with your camp fire? Dig a pit for it or clear trash from all sides of it. Be sure camp fire is out before leaving it. Be as careful with fire in the forest as you would in your own home. Be sure your match is out before you throw it away. Matches have heads, but they don't use 'em to think with.

Knock out your pipe ashes and throw your cigarettes or cigar stubs where they can't start a fire. Cigar-

ette and cigar stubs have no heads at all; you must think for them! Would you put them in your pocket still burning? No! Then don't put them in the forest burning.

Bear in mind that an ounce of prevention is worth weeks of fire fighting. When you see a fire, if you can't get to it yourself and put it out, will you notify the nearest forest officer?

ARIZONA FARM BUREAU NOTES

Adviser Jas. A. Armstrong of Maricopa County writes:

Alfalfa root rot is showing up in a few places. This disease is the most serious affecting alfalfa in this locality. It should be stamped out by plowing up the infected spot with an additional strip possibly 80 or 100 feet wide around the edges and planting to milo, kaffir, Sudan grass, cowpeas, or some crop not affected by it. If the field is used for pasture it will be a decided advantage to the stock to be able to get a little starchy food to balance the high protein alfalfa ration. It may possibly save some of those calves you have been losing lately.

Mr. Luther Steward of Phoenix believes in a home garden. He uses only that part of a city lot not actually covered by buildings but the quantities of tomatoes, cantaloupes, watermelons, etc., taken from it would run into a neat little sum of money if purchased on the retail market.

David Wallace of Mesa is getting exceptionally good results in his campaign against harvester ants. On one field of stubble harvester ants. On one parently given perfect extermination, on another field, however, which has been irrigated, they are still working after the second application of London Purple.

Mr. F. E. Godard of Phoenix is a mechanical engineer and a farmer. Last Wednesday he tried out a Bull tractor in regular farm work. In a field which was in proper condition to plow and which was fairly well set with Johnson grass, it pulled two disk plows, cutting it 18 inches wide by eight inches deep. In thick Bermuda grass sod it pulled through, but was apparently working over capacity. Mr. J. Stanley Howard, on the Yuma Road owns a Mogul I. H. C. tractor. He reports excellent service.

"The Home Garden at Chandler" will be discussed by Prof. J. J. Thornber at the next open meeting of the Farmer's Union on Thursday, July 29. Prof. A. W. McOmie has also promised to come and tell about a particular kind of hot weather sheep that are giving great results in keeping the ditch banks clean. This idea has been utilized elsewhere to keep foul stuff eaten off the roadside, but their use on the ditch bank is comparatively new.

Grow a garden and cut down the cost of living. This is the time to plant corn for late roasting ears. Lima and string beans planted now will have lots of beans when cool weather sets in.

Saturday, July 31, at 2 p. m., is the date set for the organization of Mesa Farm Improvement Association. Elijah Allen has the matter in hand.

Did you ever eat cantaloupe butter? They say it's good after fresh cantaloupes are gone.

SERVED THE PURPOSE

"Don't care abaht your dawg."

"Wot's the matter with it?"

"Legs too short."

"Well, they reach the bloomin' ground, don't they?"—Life.

Panama-Pacific Exposition Night Illumination. View from Main Entrance. The Jewel City is Wonderfully Beautiful at Night.

THIS WEEK AT THE EXPOSITION

SATURDAY is Horticultural Day, and this is Horticultural Week at the exposition. The State Fruit Growers' Convention which assembled at Palo Alto on Tuesday will devote the week to discussion of matters of interest to California fruit growers until Friday evening, at which time adjournment will be taken and the delegates will assemble in the exposition grounds on Saturday morning. The day will be given up to the study of horticultural exhibits, and in the evening addresses which are declared to be epoch-making will be given in Festival Hall by Professors J. G. Lipman, director of the New Jersey experiment station, and John M. Coulter of Chicago University.

Even Sunday will not be devoted to rest, for there will be several special features during the day, and on Monday morning there will begin 25 different events, some of which will last the entire week, some only four or five days.

To give an idea of the magnitude of this week's work in connection with the great exposition we print a list of those beginning on Monday: World's Bible Congress, United States Conference on Unemployment, International Seaman's Union of America, American Association of Economic Entomologists, Independent Order of Red Men, International Conference, Order of the Star in the East, National German-American Alliance, Association of American Dairy, Food and Drug Officials, Chinese Students' Alliance in the United States (western section), Armco Iron Culvert Manufacturers' Association, American Genetic Association, Delta Gamma Sorority, American Association for the Advancement of Science, American Phytopathological Society, Geological Society of America, American Anthropological Association, Archaeological Institute of America, International Buddhist Congress, Entomological Society of America, Biological Society of the Pacific Coast, Seismological Society of America, American Paleontological Society, Entomological Congress, American Physical Society, American Association for the Study of the Feeble-Minded. There will also be bicycle races and special athletics on this day.

See Our Potato Beetle

It is 10,000 times as large as the largest one you ever saw. Learn how to kill him.

California Spray Chemical Co.

Luitwieler Pump

Be sure and see the famous Luitwieler non-pulsating pumping system at the fairs. Write for free pumping booklets.

Luitwieler Pumping Engine Co.
707 N. Main St. Los Angeles

On Tuesday, in addition to many other events, will be held the first meeting of the Society of American Bacteriologists; the American Social Hygiene Association, and the American Astronomical Society.

Features announced for other days of next week are:

Wednesday, August 4: Race Betterment Congress.

Thursday: American Druggists, Typographical Union, Saengerbund, Universal Corn Convention under the auspices of the National Top Notch Farmers' Club, State Beekeepers' Association, Southern California Day, Trinity and Shasta County Days.

Friday: Pacific Coast Students' Congress of Y. W. C. A.

Saturday: Dairy Inspectors' Association, Sacramento Valley Automobile Association.

There are also scheduled for the week special attractions in illuminations and fireworks. The live stock show is giving special exhibitions every day, and we are told that the exhibit of horses, cattle and sheep is exceptionally fine.

It does not seem possible that one or two weeks could give sufficient opportunity for so many conventions and special features as indicated above, but it must be borne in mind that in order to dispose of the 825 conventions which are to be held in connection with the exposition the executive ability of the management has been exercised to the utmost, and though many must be held simultaneously, meeting places have been provided for all.

Coming conventions which will be of interest in connection with the exposition are: Society for the Promotion of Agricultural Science, San Francisco, August 9 and 10; Patrons of Husbandry, National Grange, Oakland, November 10 to 19; American Society of Agronomy, Berkeley, August 9 and 10; American Farm Management Association, Berkeley, August 9 and 10; American Association for the Advancement of Agricultural Teaching, Berkeley, August 10; National Congress of Boys and Girls' Agricultural Clubs, Berkeley, August 10 to 15; Association of American Agricultural Colleges and Experiment Stations, Berkeley, August 11 to 13; Michigan Agricultural College Reunion, San Francisco, August 12; American Association of Farmers' Institute Workers, Berkeley, August 13 and 14; Departmental Congress on Rural and Agricultural Education, Oakland, August 17; School Garden Association of America, Oakland, August 18 to 20; International Congress of Farm Women, San Francisco, August 31 to September 3; American Pomological Society, University of California, September 1 to 3.

The Cereal Conference is a progressive one in more than one respect, being a convention on wheels. Its first meeting is in Merced, the second at the University of California, in Berkeley, and the third is at the State Experiment Station at Davis. The conference is under the direction of the University of California and the United States Department of Agriculture, and participating will be United States experts and other scientific men, among them Carleton R. Ball, of the State University, Dr. E. Ravn, of Copenhagen and M. A. Carleton, of the United States Department of Agriculture.

John Deere Implements

A New Book
Free

Just Off the Press

Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions. It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements: Steel plows, cultivators and harrows; corn planters, disc harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side delivery rakes; motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasoline engines.

To get this book free, state what special implements you are interested in and ask for the book as Package No. X-111.

Van Brunt Single Disc Grain Drills

Van Brunt Drills plant any small seed from alfalfa to bearded oats, corn and peas exactly where it will bring the best results—at the bottom of furrows of uniform depth. All the grain is up and ready for harvest at the same time.

No seed is wasted, all the field sown. Van Brunt Drills have an adjustable gate force feed which compels an even, continuous flow of seed from each seed cup without bunching or cracking the seed. It cannot choke up.

The seed is planted at uniform depth. It beats the dirt. Individually adjustable pressure springs can be made to force discs to cut furrows even depth. Seed is conducted from hopper to furrow opener by metal tubes and there protected from dirt until it reaches bottom of furrow.

The "Light Draft Drills"

Van Brunt Drills are so called because they are light weight, well balanced and yet so strong that they work entirely satisfactorily under difficult conditions.

No stub axles are used—none required. Simplified construction makes Van Brunt Drills easier to operate.

Main axles are continuous. Drills are gear driven direct from axle. Each wheel drives half the feeds, insuring smooth running.

Hopper is extra large, well braced and has tight fitting two-piece covers. It does not sag.

Disc bearings guaranteed. They will last lifetime of

drill. Disc blades are high grade steel kept absolutely clean by spring steel scrapers.

Grass seeder attachment can be furnished for any Van Brunt Drill. It will sow broadcast or drill, as desired.

Write for free booklet "John Deere-Van Brunt Single Disc Drills." It explains why you will get the biggest yield by using Van Brunt Drills.

John Deere Publicity Department, Moline, Illinois

POMONA

DEEP WELL PUMPS

For deep lifts, as well as shallow lifts, combined with high heads above surface and through long pipe lines. No auxiliary pump needed for forcing water above the surface.

Built and sold in California over 12 years. Hundreds of buyers will tell you they are always reliable and economical.

No pit required. Does not get oil into the water. Consumes less power per unit volume of water pumped.

A TORRENS TITLE

Written for the California Cultivator
By J. H. McEldowney

HERE is no difference between title or the ownership of real estate and any other kind of property.

There is distrust and unbelief about the right of a person to dispose of real estate, that does not exist about other kinds of property. Few people will buy real estate on the owner's word. He must get what is called a "guarantee," a certificate of title.

These certificates depend upon "record titles," and some of the evils connected with them are: Uncertain titles; imperfect security for loans; copying of papers; mistakes made in copying, or recording; expense of searching titles; escrow and certificate of title expense; loss of papers, either while in escrow, or recording; property tied up in escrow; money of no use while in escrow; long delays in deals; expense of making and acknowledging deeds; certificates worth little when issued and worth less the next day; continuous expense of transfers, etc., many certificates to the same piece of land; defects, flaws, clouds not removed; no change in the value of the title.

These are not attached to the Torrens system, because those titles are real titles, not record titles.

Questions of title, or right, grow out of everything. Someone owes you money. You believe you have a right to it. You start a suit, prove your right and get a judgment. Your belief has become a fact. You know and everyone else may know the money is owing to you. You have a real title to so much money.

With real estate it is the same. You believe you have a title. You cannot be certain, because you have the former owner's old title "brought down." The only title you have you got from him. If he did not guarantee the title then you have no guarantee. He is the only one who can say it is good. You have a deed, and that is the only certificate of title you can have.

You may have what you think is a "guarantee" of title or ownership, but it is not such. That document is only a statement of a search, or examination, and a guarantee of the search. That is all.

Your present title you got from the person who sold you the land. A Torrens title you get from the state. Each time the property changes owners a new title is issued.

A Torrens title is obtained by filing a petition in the superior court, asking the court to allow you to prove your title and have it registered.

This petition must contain all the facts regarding your ownership and any claims, restrictions, etc., that may be against the land. What they are makes no difference. If the title is yours you can have it registered. Your petition must be honest because the state is going to protect you, and there must be no fraud on the state.

Your petition having been filed, the court reads it over and orders a notice published. This is notice to anyone who claims any right in the land to come into court and state what

objections he may have to your having the title. To object many be costly, and no one will come without very good reason.

After the time allowed for objectors to appear has passed, a day is set for hearing the petition, which may take half an hour.

At the hearing you proved your title or right to the land, as you proved your right to the money. Your title has become a "real title," and it is your own, not somebody's old title "brought down." The important fact of the proof is that you and the persons who owned the land before you, had continuous, "open adverse and exclusive" possession for more than five years just preceding the filing of the petition. If this cannot be shown then an abstract is required.

This fact need not be shown if you have a state tax title deed, because the state has held the property for five years before selling it.

At the close of the hearing the judge makes a decree, or order, which gives the land to you, and the title is registered in your name. This occurs but once for each piece of land.

Because the law says: "This decree shall forever quiet the title to the land therein ordered registered and shall be final and conclusive against the rights of all persons known and unknown," your ownership is certain. To make your title more secure, another part of the law provides that no person shall commence any action for the recovery of the land or assert any interest or right in or make any entry thereon adverse to the title registered.

You take your decree to the registrar (recorder). He makes two certificates. One, the original, he keeps, the other, duplicate, he hands to you, and you sign a receipt. This receipt is kept for future reference when deeds or mortgages are filed. This duplicate certificate will cost you one dollar.

This duplicate is proof of your title or ownership, and is just as good any time, five, ten, 50 or 100 years after, as when issued. On the duplicate is shown the page where all claims are entered.

To Sell or Exchange

CONCRETE FOUNDATIONS FOR FARM ENGINES

To obtain the highest efficiency an engine should have a heavy and firm foundation. This will not only reduce wear and tear incident to excessive vibration but will result in prolonged and better service. Rigidity and durability in the foundation are best obtained through the use of concrete.

The concrete should be mixed in the proportion of one part Portland cement, three parts clean, well-graded sand, and five parts crushed stone or gravel. All parts should be determined by volume and the use of accurate measuring boxes should be rigidly observed. The sand should all pass a one-quarter-inch mesh sieve, and the crushed stone or gravel should pass readily through a one and one-half-inch sieve. In no case should bank-run gravel be used as taken from the deposit. It should be passed over one-quarter-inch and one and one-half-inch screens. That which passes the one-quarter-inch screen is sand, and that which passes the one and one-half-inch screen and is retained on the one-quarter-inch screen is gravel. If the size of the engine warrants the use of a reinforced concrete footing, a 1:2:4 mix should be used for the reinforced portion of the concrete. Sufficient water should be used to form a plastic, wet consistence but not enough to cause separation of the cement and aggregates when placed.

Footings

For footings over six or eight square feet in plan, stone up to two and one-quarter inches may be used. The stone should be graded as this will insure a strong, dense concrete.

Construction

After the exact location of the center line of the foundation has been carefully established, a pit two feet to four feet deep should be excavated, the length and width being the exact size of the footing. Deposit the mushy wet concrete to the depth determined on the plan. In order to thoroughly key the engine foundation to the footing embed three- or four-inch stones in the portion of the footing under the engine so that they will protrude from the footing.

The Forms

A box form eight inches larger in length and width than the engine base should be carefully set over the footing. The inside of the forms should be thoroughly oiled to prevent the concrete from adhering to same. It is essential that the anchor bolts for the engine be carefully spaced and so placed as to take care of any small variations in position. Use a templet for this purpose, and supply for each bolt greased gas pipes of twice the diameter of the bolts, the pipes to be removed before the engine is set. The purpose of the pipe is to provide for such slight adjustment of bolts as may be required. The anchor bolts should be embedded in the concrete at least 18 inches and supplied with cast-iron washers at the lower ends.

After the templet has been accurately set over the forms and the bolts so

arranged that the tops are at proper elevation the concrete is carefully de-

A Durable Concrete Engine Foundation

posited and spaded in the forms. Turn the gas pipes from time to time, thus

preventing them from sticking to the concrete. The concrete along the forms should be carefully spaded to prevent the formation of air-bubbles or pockets.

Damp burlap should be placed over the form after the concrete is placed. This will insure normal setting of the material. After 24 hours remove the form. The engine may be set and the bolts adjusted after 48 hours. Before the engine is set remove the gas pipes referred to above and when the engine

is finally placed, fill the space around the bolts with 1:1 mortar.

Do not use the engine until the base is at least two weeks old. If necessary to have an exhaust or drain pipe, this may be installed in the form before the concrete is deposited.

NURSE CROP WITH ALFALFA?

There is a decided difference of opinion among growers of alfalfa concerning the relative value of a nurse crop. Many are of the belief that a nurse crop is essential to a good stand of alfalfa, while others are of the opinion that a nurse crop is unnecessary. As a rule on sandy lands that are subject to blowing, or on heavy lands which have a tendency to bake, a nurse crop may be of benefit as it reduces blowing or baking. Oats and barley make the best nurse crops because they shade the ground the least. They should be seeded at the rate of from 30 to 40 pounds to the acre. These should be cut for hay so as not to shade the alfalfa plants too long. Unless the soil is subject to blowing or baking it is not advisable as a general rule to use a nurse crop. Under dry land conditions a nurse crop should never be used, as the moisture supply is too limited to sustain two crops at one time.—James Marshall, Colorado Agricultural College.

It is a safe rule to always cut alfalfa for hay when the new shoots for the next crop start out from the crown plants regardless of whether the plant is in bloom or not.

- send for the famed WHITING-MEAD CO. CATALOG of BUILDING MATERIALS FREE! 1915 Edition - Save 20 to 40%

—For the rancher, the householder or for any man who wants to save 20% to 40% on Building Material this FREE CATALOG is invaluable. It illustrates, describes and prices the complete stock of the largest concern of its kind west of Chicago. It is saving 20c to 40c on every Dollar for thousands of satisfied customers. Send for your copy—Today!

Long and Short Handled SHOVELS at Wholesale Cost

—This is a great opportunity for farmers, contractors improvement and development companies, to secure quantities of shovels for present as well as future needs.

Whether You Buy One or a Dozen You Can Save Money

—They are all in good working condition, have been slightly smoked by reason of having been in a ship that caught fire, but this in no way affects their usefulness.

Long Handle, Round Point Shovels, per doz. \$4.85 or 50c each
Long Handle, Square Point Shovels, per doz. \$4.85 or 50c each
D Handle, Round Point Shovels, per doz. \$4.15 or 50c each
D Handle, Square Point Shovels, per doz. \$4.15 or 50c each
Long Handle Spades, per dozen \$3.75 or 40c each
D Handle Spades, per dozen \$3.75 or 40c each
Long Handle Scoops, per dozen \$3.75 or 40c each
D Handle Scoops, per dozen \$3.50 or 40c each

26-Gauge Painted Corrugated Iron Per 100 Sq. Feet. \$2.60

\$30 Fiber Wall Board for \$19

—Has three layers of fiber with waterproof composition between the layers. Nothing better for finishing new or re-finishing old walls. Of the same workmanship and quality as the kind that most dealers sell you for \$30 and more per thousand square feet.

\$1.50 Oil Wood Stain \$1.00

—A fine quality oil wood stain for interior finishing. Much used for bungalows, etc. Makes a fine lasting finish.

65c to 75c Shingle Stain 50c
—All colors of shingle stain except gray that should be selling at 65c to 75c per gallon, now going at 50c per gallon, in five-gallon lots.

READY ROOFING (Paper)

\$1.15 to \$1.75

1 ply Double Sanded, per roll \$1.15
2 ply Double Sanded, per roll \$1.40
3 ply Double Sanded, per roll \$1.65
1 ply King, per roll \$1.25
2 ply King, per roll \$1.50
3 ply King, per roll \$1.75
Snow-white Roofing Paper, per roll \$1.75

TOILETS AT \$15.50

COMPLETE WITH VITREOUS CHINA BOWL AND TANK

—These toilets are perfect in every respect and fully guaranteed. Made by the famous Johnson Bros., Hanley Limited, England. Both bowl and tank are of vitreous china, and wood seat is fitted with finest post hinges. Other dealers would charge you at least \$20 for toilets like these. —Special steel enameled bath tub \$8.00. Other sizes \$8.50, \$9.00 and \$10.00.

Freezers 1/2 and Less

—Dana Ice Cream Freezers always command full price. Here they are at 1/2 and less. 2-quart size, reg. \$1.75, now \$.75
3-quart size, reg. \$2.25, now \$1.00
4-quart size, reg. \$2.50, now \$1.25

\$2.25 House and Floor Paints, \$1.25 Gallon

—Secured by us at bankrupt sale; lot includes many famous brands. Good assortment of colors.

\$2.50 Varnish Remover, \$1.75 Gallon

—The famous Hi-Lo varnish remover, said by many to be the most practical of the many varnish removing preparations.

\$2.25 Wall Paints, \$1.25

—Made especially for use in kitchens, bathrooms, etc., as steam and heat do not affect them. Can be washed with soap and water without injury.

12c Wall Paper Paste, 10c Pound
—Dry wall paper paste, the kind that we sell to regular paper hangers. Other stores sell this regularly for 12c; our price, 10c pound.

Entered at the Post Office at Los An-
geles, California, as Second-Class Matter.**Thursday, July 29, 1915****OUR ADVERTISERS RELIABLE**We guarantee our subscribers against
loss through dishonesty of any adver-
tiser in the Cultivator. We do not at-
tempt, however, to adjust trifling differ-
ences between subscribers and honest,
responsible advertisers, nor will we pay
the debts of honest bankrupts. Notice
of complaint must be sent us within 30
days from date of the transaction, and
the subscriber must have mentioned the
Cultivator when writing the advertiser.**MAIL AT P. P. I. E.**We have a letter from Superin-
tendent F. B. McStocker of the Model
Postoffice at the P. P. I. E., in which
he says:"We have a general delivery at this
station, and mail addressed to General
Delivery, Model Post Office, will be
delivered."This will be a great convenience to
attendants at the exposition who may
wish to receive word from their friends
and it will also give them opportunity
to view the workings of this model
office.**HONOR FOR HILGARD**A marble chair is to be placed
in the Greek Theatre of the Univer-
sity of California in honor of Dr. Eu-
gene Woldemar Hilgard, practically
the founder of the science of the geol-
ogy of the soil, known the world
around for his discoveries in reclama-
tion of alkali soils, the man who estab-
lished at Berkeley the first agricul-
tural experiment station ever founded
by an American university, and first
dean of the college of agriculture and
first director of agricultural experi-
ment station of the University of Cali-
fornia.**AGRICULTURAL ALUMNI**Alumni of agricultural colleges
are invited by Deputy State Horti-
cultural Commissioner Weldon and Prof.
Van Norman of the University farm
school at Davis to meet during the
Fruit Growers' Convention, which is
now in session at Stanford. The ob-
ject is to perfect a permanent asso-
ciation of college men engaged in agri-
culture. All are invited irrespective
of their colleges. There are hundreds
of college men in this state activelyengaged in advancing the science of
agriculture. They will doubtless be
greatly aided in their work by such
an organization.**WICKSON FOR PRESIDENT**An Eastern admirer of Dr. E. J.
Wickson of California has written sug-
gesting that since the American Pomo-
logical Society meets in this state this
year there should be an organized ef-
fort to make Dr. Wickson the next
president. The gentleman who makes
this suggestion is Mr. Stark of Mis-
souri, who says in a personal letter:"The leading men of the East feel
that Dr. Wickson should be honored
and elected the next president. He has
accomplished a great work."Certainly this organization would be
honored by having Dr. Wickson as its
president, and Californians will be
proud to aid in his election.**AUTOS IN NATIONAL PARKS**The American Automobile As-
sociation writes regarding rules in
certain national parks, which are ob-
noxious to some motorists. "There
may be some motorists who will com-
plain that the regulations are unhap-
pily strenuous, but it is believed that
a general spirit of good sportsman-
ship will prevail on the part of those
using their automobiles for touring the
parks, and because of this the rules
will be accepted as they ought to be.
With motorists showing a full appre-
ciation that they are pioneers in the
opening of the parks, they will demon-
strate ways and means for better all
round regulations that are bound to
come from the experiences this year
of those in charge of the parks and
the enforcement of the new rules. It
is an experiment not without certain
risks, and obviously there must be no
accidents to mar the opening."Doubtless some of the restrictions
are deserved and others which are
not will give way as time passes and
the department is assured motorists
will be careful. Of course it is mad-
dening to have so much red tape as to
prevent true enjoyment of the beauties
of these great parks.**ENFORCING FRUIT LAW**The horticultural commissioners
of Fresno and surrounding counties
have been asked to meet at Fresno at
an early date in conference with fruit
growers to devise means of enforcing
the new fruit standardization law.
President Madison of the Associated
Raisin Company is urging that fruit
shippers generally encourage heartily
the enforcement of this law which be-
comes effective August 7th. In an in-
terview quoted in the Fresno Republi-
can President Madison is reported as
saying:"The fruit standardization bill is one
of the finest things that ever happened
to the green fruit industry. Without
such regulation there have always
been a few unscrupulous or short-
sighted shippers and packers who were
willing to unload inferior products on
the market. The reputation of Cali-
fornia fruits has been undermined by
such bad methods."What we hope to do is to get the
substantial members of the industry,
growers, packers and shippers, behind
the law at the outset. We want to
devise means for helping the horti-
cultural commissioners who will look
after enforcement of the law in each
county."**EXPANDING**The magnificent work done by
the Associated Raisin Company in se-
curing satisfactory prices for raisin
producers is certainly an encourage-
ment to all cooperative effort. We are
glad to see that President Madison
and the association are extending their
influence and their efforts to benefit
the dried fruit business generally. It
is now proposed that instead of mak-
ing up solid cars of raisins for certain
of the smaller markets the Associated
ship combination cars of raisins and
various other dried fruits. Mr. Madi-
son says:"We will only handle dried fruits
when orders come in for them, but
have branched out because we believe
we can stimulate sales of raisins.**HORTICULTURISTS MEET**Special Report from the
Convention.—The word horti-
culture covers much in its general
application. It is being gener-
ously used at the state conven-
tion at Palo Alto, for the whole
range from apples and bees to
potatoes and pears is being dis-
cussed. Yesterday and today
(Tuesday) the county horti-
cultural commissioners and the
West Coast Potato Growers As-
sociation have been running com-
petitive attractions, but this
evening we are all to gather to-
gether and listen to a welcome
from David Starr Jordan, then
get down to four days of hard
work with the State Fruit Grow-
ers.Representative scientists from
many parts of the United States
are here, and a few, a very few,
practical growers. They are ap-
parently depending on the Cul-
tivator to get the news and pass
it on. It will endeavor to meet
expectations and will be here all
the week.Today the potato growers dis-
cussed the serious situation
which confronts them. They are
producing 30 or 40 sacks per
acre, and they made comparison
with that English lord who has
produced 2000 bushels on one
acre. Eugene Grubb told them
that they must observe funda-
mentals, such as soil tempera-
ture, porosity of soil, planting
whole seed, feeding a "balanced
ration," making proper selection
of seed, etc.Prof. Fitch, a potato specialist
of Indiana, spoke of more fertile
soil. Mr. Shear, an expert of
the department, spoke of need
of experimental planting, and
Mrs. Neilsen, Mr. Essig, Mr.
Crawford, Miss Clark, Mr.
Phreaner and others urged ne-
cessity for more careful work.An effort is being made to se-
cure a fund to finance experi-
mental work. More of that an-
other week.The horticultural commis-
sioners of the state are here and
having fine sessions. Better
work in every county will result
from the convention.—C. B. M."As this company has now estab-
lished offices in New York and Chi-
cago and has made arrangements with
brokers in every city of the United
States and Canada to sell its raisins,
it has been concluded that it will be
necessary for the company to go into
the dried fruit business for the pur-
pose of retaining good representatives
to sell our raisins. It would not be
possible to hold a broker of any ability
unless we were able to supply him
with a full line of California dried
fruits."This, we hope, will put the Associ-
ated Raisin Company in the selling line
with all other reputable concerns sell-
ing California dried fruits through
brokers."This company has no intention of
speculating at all, only purchasing
enough dried fruits to fill its require-
ments."**Agricultural Notes**Fuel molasses is to be shipped from
Hawaii to California to compete with
California fuel oil.A two-cent letter postage went into
effect between the United States and
the Dutch West Indies on July 1.Dried loganberries from Oregon are
becoming popular in New England. A
Boston firm has sent an order for
20,000 pounds.California ginned 49,835 bales of cot-
ton in 1914. Part of this was pro-
duced in the Mexican portion of the
Imperial Valley.The provincial government of Nova
Scotia has appointed a commission to
investigate the Torrens system of reg-
istration of titles to land.New Zealand fruit growers suffered
heavy losses from freezing of fruit last
season. Many saved their crops by
burning oil in the ordinary oil can cut
in two.Owing to the participation of Italy,
Egypt's biggest supplier of paper, in
the war, the Egyptian newspapers are
suffering from a serious shortage of
paper and have been reduced in size.The Fruit Growers' Association of
New South Wales, at its recent meet-
ings, is considering methods of keep-
ing out of Australia imports of lemon
juice from America, Italy and Japan.Reports from the cranberry sections
of Cape Cod, New Jersey, and Wis-
consin state that in consequence of
the cold weather a few weeks ago the
cranberry crop will be short at least
30 per cent.The newly discovered halibut banks
off the coast of Washington and Ore-
gon are yielding heavy catches. One
schooner recently brought in to Seat-
tle a 160,000-pound catch, which was
sold for \$10,800.Japan had a very heavy crop of pea-
nuts last year and closed the year
with prices 15 per cent higher than
the previous year. She is also ex-
porting more extensively of apples
than ever before.A contract has been closed by a
merchant in Habana for the importa-
tion from the state of Washington of
about 750,000 feet of western spruce
timber. This undoubtedly will be the
first consignment of Pacific Coast tim-
ber to Habana by way of the Panama
canal.Italian growers are very successful
in raising and packing tomatoes. Over
20,000,000 pounds of canned tomatoes
are shipped annually to the United
States and about half that quantity
to South America. The skins are used
for stock feed; the seeds for oil, both
edible, and for soap making.A limited market for dried fruit
from the United States is growing
in southern Italy, particularly in ap-
ples, pears and prunes. It is reported
that the demand for prunes has de-
veloped through the advice of some of
the Italian doctors, who prescribe this
form of food for their patients. The
prunes are retailed in Naples at 27
cents per pound for the best variety,
23 cents for the medium variety, and
18 cents for the third grade.The potato is Alaska's most impor-
tant crop. The Fairbanks station has
grown potatoes for market for several
years. The main object was to dem-
onstrate that good potatoes could be
grown in the interior, and the farmers
in the vicinity have taken the hint
and nearly all now grow a consider-
able acreage of potatoes, one estimat-
ing his crop as high as 50 tons. Potatoes
are usually classed as a money
crop. Hog raising is also being started
at Fairbanks, the hogs to be fed the
small unmerchantable potatoes.

Agricultural News Notes

of the Pacific Coast

Northern California

The dove season in Yolo County will open September 1.

Several inquiries have been received from London for prune quotations.

The supervisors of Sonoma County have fixed the official weight of bread at 12 ounces.

Apple packing plants in the Sebastopol section are busy on Gravensteins and other early varieties.

Farmers' short courses at the university farm at Davis will be held from October 4 to November 12.

The California Fruit Canners' Association has announced that its cannery at Marysville will not be opened this season.

The Sacramento Valley Development Association has declared itself in favor of holding an annual live stock sale at the State Agricultural Park at Sacramento.

All 14 of the counties included within the Sacramento and San Joaquin drainage district are reported to have filed suits to prevent action by the district reclamation board.

A swine breeders' association has been organized at Dixon, Solano County, among members of the farm bureau. Committees are working on the formation of four others in the county.

Work of constructing the irrigation system for the Anderson-Cottonwood district will soon be started. When completed 32,500 acres of Sacramento River bottom land will be brought under the ditch.

The Davis Almond Growers' Association held its annual meeting Saturday, July 12. Yolo County furnishes about 80 per cent of the almonds handled by the California Almond Growers' Exchange.

Redding, Shasta County, has already subscribed \$2800 for the Northern California exposition to be held there early in September. Siskiyou, Lassen and Modoc Counties will join with Shasta in the exposition.

Trinity County has decided to take part in the Northern California Exposition to be held in Redding, Shasta County, September 4-10. The county horticultural commissioner will have charge of the Trinity exhibits.

A unit of the Nevada County farm bureau has been organized at Chicago Park and the following officers named: President, W. F. Bierwagen; secretary, C. K. Brown; directors, Mrs. W. S. Koeller, Mrs. F. C. Bierwagen and Judson Steele.

Supervisors of Siskiyou County have notified the Central Pacific Railway Company of their intention to raise the valuation on their timber lands from \$2.50 to \$8.00 per acre. This would increase the total assessed value in the county approximately \$1,000,000.

The California Ripe Olive Association has selected John J. Avis of San Francisco, president; L. Underhill, San Francisco, secretary; George C. Mansfield of Oroville, director of exploitation, and the following directors: A. B. Miller of Fontana; W. P. Hammon of Oroville and San Francisco; F. B. McKevitt of Sacramento.

Central California

Kings County has 55,000 acres in alfalfa.

September 23-25 is the time set for the district fair at Merced.

Merced sends out an average of 25 carloads of tomatoes weekly.

There are more ducks on Tulare Lake now than are usually seen.

Stanislaus County has 20,000 acres in wheat this year. Five thousand is the usual acreage.

The ripening of Malaga grapes is late this season in Fresno County. The first carload shipments are not expected to leave until August 15.

County Horticultural Commissioner Roullard of Fresno County will have an exhibit of pests of the orchard and garden at the Fresno district fair.

Merced tomato growers are sending out shipments averaging 25 carloads per week. The crop is reported heavy, the fruit fine and prices satisfactory.

The newly organized swine breeders' association of Madera County has over 50 members with locals at Alpha, Dixieland, Fairmead and Chowchilla.

It has been stated by the secretary of the Japanese Association of Fresno that about 1000 Japanese will be brought into the country to handle the fruit crop.

Horticultural Commissioner Marchand of Madera County is suggesting that a squirrel drive similar to the rabbit drives held years ago might be a very good thing.

Horticultural commissioners from four counties adjoining Fresno have been asked to meet green fruit packers at Fresno to discuss means of enforcing the new standardization law which will take effect August 7. The date of the meeting is not yet announced.

A cooperative creamery association has been formed in Los Banos with the following directors in charge: O. L. Divens of Dos Palos, C. H. Waggoner and M. A. Bettencourt of Los Banos, Joseph Vocha of Volta, M. G. Oliveria and P. L. Tagilo of Gustine and M. A. Marshall of Ingomar.

Directors of the California Green Fruit Association are urging growers and packers not to unload inferior fruits on the market before the standardization bill becomes effective on August 7. There is some apprehension that unscrupulous interests will in this way seriously injure legitimate fruit shipping.

The Associated Raisin Company has decided to go into the dried fruit business. Most of the dried fruits will be handled in assorted car orders. Manager Madison explains that this is to help the sale of raisins, as many jobbers in the East are not willing to order a full car of raisins but will order a combination car.

At a recent meeting of the Porterville Citrus Association the following directors were elected for the ensuing year: C. E. Robin, Peter Ting, C. E. Lewis, W. L. Ross, M. V. Hutcheson, John Orr, H. C. Carr, W. P. Bartlett, A. J. Newbury. The officers chosen are Peter Ting, president; H. C. Carr, vice president and treasurer; J. A. Milligan, secretary and manager.

Southern California

Slicing of beets began at the Oxnard sugar factory July 24.

The bean harvest will begin in Orange County about the middle of August.

The farm bureau of Ventura County has distributed over 3000 gallons of squirrel poison to its members.

By the collapse of a beet dump at San Onofre, San Diego County, four men were quite seriously injured.

One hundred and seventeen attended the last meeting of the Bonsall local of the San Diego farm bureau.

Preliminary tests made at the sugar factory at Huntington Beach show good content of sugar in this season's crop of beets.

Vegetable growers of San Diego County have formed a cooperative marketing association. It is known as the Winter Vegetable Union.

The Orange County Fruit Exchange reports a number of sales of oranges in the Philadelphia market during the past week at prices ranging above four dollars.

Yucaipa's apple show will be held for three days in the month of October, exact dates not yet having been determined. The prospects are for a heavy crop.

The Mound Farmers' Club held its July meeting on the 20th. There was a large attendance. Addresses were made by members of the Good Roads Commission.

Seventy carloads of potatoes is the estimate of the season's shipments from Puente in the San Gabriel Valley of Los Angeles County. Most of the shipments now are being made to Texas.

The experiment of Forest Supervisor Charlton in trying out goats to keep the fire breaks cleared has been unsatisfactory, the goats preferring to browse on the grassy pastures in the valleys.

The California Grape Protective Association has decided to put an initiative constitutional amendment before voters next fall, providing for compensation for grape growers if the prohibition campaign succeeds.

The Heber Melon Growers' Association has begun suit against W. S. Fawcett for \$22,000, which the Association claims is due for cantaloupes delivered. Mr. Fawcett has been handling their entire output this year.

Farm Adviser Weinland of San Diego County has been given an assistant in the person of George H. Wilson. The assistant's principal work at present is to be the organization of the Winter Vegetable Union.

Several experimental shipments of grapes packed in sawdust have been sent from Imperial Valley to Eastern points. The first shipments were of the Persian 21 variety. Later experiments will be made with Malagas.

The Armour Packing Company of Los Angeles will fight complaint of short weight butter made by the Orange County sealer of weights and measures, who states that he has found butter short-weighted as much as an ounce and a half to the pound.

The Coast

Chandler, Arizona, is practically assured of a creamery station.

Hop growers estimate the 1915 yield of Oregon at about 140,000 bales.

Clarke County, Washington, reports prospects for a good yield of prunes.

Chandler, Arizona, shipped out 14 carloads of produce on one day last week.

Fine agricultural exhibits are expected at Arizona's State Fair to be held November 15-20.

Several alfalfa seed raisers of the Yuma Valley of Arizona have purchased seed hullers.

The annual meeting of the Arizona Wool Growers' Association was held at Flagstaff on July 6.

A Yuma wool grower has imported a number of fine Dorest sheep from Ohio to breed up his flocks.

Cattle growers of Yavapai County, Arizona, at their annual meeting in July, re-elected all the old officers.

One wool grower of Deer Lodge, Montana, has just sold his entire clip of 34,000 pounds at a price of 26 1/4 cents.

The New Mexico Cattle Growers' Association has changed its name to New Mexico Cattle and Horse Growers' Association.

The Yakima Valley Fruit Growers' Association has shipped 314,074 pounds of cherries to one cannery at four cents per pound.

An advance of two cents has been made in the Portland hop market. Several offers of 13 1/2 cents have been made for the 1915 crop.

Stockmen of the Southwest are protesting before the Interstate Commerce Commission the proposed increase in freight rates on live stock.

The Farmers' Union of Chandler, Arizona, held an open meeting July 24. Prof. McOmie of the state university talked on "Sheep on the Ditch Bank."

The New Mexico Cattle and Horse Growers' Association offers a standing reward of \$25 for each wolf or mountain lion killed, and \$10 for each pup or kitten.

During the last two years the dairy industry in Benton County, Washington, has increased largely. Cows in dairy herds now number 2300 against 500 two years ago.

The federal government is testing the possibilities of hog raising in Alaska. Several pure-bred Duroc Jerseys are being tried out at the experiment station at Fairbanks.

Broom corn growers of the Chandler, Gilbert and Higley districts in Arizona met at Chandler, July 12, to sign up contracts and devise plans to secure cooperatively owned threshers.

Prosser, Washington, is getting ready for its corn and hog show October 21-23. Forty-six children have entered the pig club contest and many are in the corn growing contest also.

A trainload of 26 cars of steers was shipped from Phoenix, Arizona, on one day last week, destined for the French army. Forty to 50 carloads of horses will also be shipped from the same point to France within a few days.

"DOG DAYS" the best time to buy a DE LAVAL SEPARATOR

THERE was never before as good a time to buy a De Laval Cream Separator as **right now.**

The "Dog Days" are at hand when dairying is most difficult without a separator and when the increase in quantity and improvement in quality of cream and butter are greatest through the use of a good separator.

Then there is the great saving of time and labor, which counts for more in summer than at any other season and often alone saves the cost of the separator, aside from all its other advantages.

This is likewise the season when De Laval superiority counts for most over other separators,—in closer skimming, larger capacity, easier running, easier handling, easier cleaning and absolute sanitairiness.

A De Laval Cream Separator bought now will easily save its cost before the end of the year, and it may be bought for cash or on such liberal terms as to actually pay for itself.

THE VALUE OF CROSS-BRED WOOL

By Robert F. Miller

THE following is a communication lately received from Mr. S. B. Hollings, wool expert of Bradford, England, with reference to two fleeces of cross-bred wool that I sent him May 15, 1915 in order to get an expert opinion regarding the spinning count and the valuation for comparison with United States prices. The fleeces were from Mr. Thornton Glide's flock at Davis, in this state, and one was a Dorset-Rambouillet cross and the other a Shropshire-Rambouillet cross. The fleeces were of spring lambs that had been shorn in August and then again in March. The second clip, August to March growth, is the one in question.

"10 Booth St., Bradford, Eng., June 30, 1915. Mr. R. F. Miller, University Farm, Davis, California. Dear Sir: I beg to acknowledge receipt of your letter of the 4th inst. and the safe arrival of the two fleeces.

"Re: the Dorset Horn Rambouillet hogget. I like this by far the best. The staple is more compact, it shows 56's quality, which is really fine half-bred, and is a valuable fleece. The worst feature is the shortness of the staple, and this wants to be at least four inches long, but being shorn last August and in March accounts for the shortness. It is most difficult to say the exact price of this fleece in London, but conclude it will be worth somewhere from 32 to 34 cents per pound, in fact, if it were longer and more like a full 12 months' grown fleece, such as we got from New Zealand, it would be worth today from 38 to 40 cents.

"Regarding the Shropshire Rambouillet fleece, this is only 50's quality, the staple is more loose and fuzzy, and would go for lower class yarns. The value here is about two cents per pound less than the previous fleece. It is lighter in grease, but it lacks a little compactness.

"I might say that both fleeces are essentially hosiery wools, although the first named could be easily used for carded woolens. Were I the owner of this flock I should discard both these crosses and on my Merino ewes I should use either the Romney Marsh, Lincoln or Leicester ram. You would then get a bigger sheep, more valuable for mutton purposes, and I think on the whole a more valuable fleece of wool. Yours faithfully, S. B. Hollings."

Food for Thought

The above letter certainly has some points of interest to the woolgrower of this country. In the first place Mr. Hollings estimates that this wool would be worth six to eight cents per pound more were it of normal length of 12 months' growth. Wouldn't it be worth while to consider shearing once a year! He also terms it a hogget, although it has been shorn twice.

The most important item, however, is the matter of price. Similar wool in this country at the present time is selling for twenty-four cents a pound, or a difference of eight to ten cents in favor of Bradford prices. At that rate wool growers could almost afford to ship by parcel post and make

money. There is a joker in the wool business. How can we get him out!

Lastly, Mr. Hollings strongly recommends the long wool Romney Marsh, Leicester or Lincoln cross in preference to a Dorset or Shropshire.

ANOTHER OFFERING OF HOLSTEINS

McAlister & Son now announce the dates for their next great sale of Holsteins. It will be at Sacramento, October 6 and 7, and will be in combination with some stock from the ranch of Morris & Sons. Regarding the stock which he will offer, Mr. McAlister writes: We will consign about 75 animals of the 150 head of the very best of our herd, there being in the number over 30 A. R. O. cows, some with very large official milk and butter records. In this consignment will be about 20 daughters of our senior herd sire, King Pontiac Topsy, who is one of the best individuals and one of the best transmitting sons of the great King of the Pontiacs. King Pontiac Topsy now has already nine A. R. O. daughters, and this number is bound to increase. He has 164 A. R. O. sisters, among whom are the world's record 44-pound cow, K. P. Pontiac Lass, and nine other cows with records of over 30 pounds of butter. These daughters of King Pontiac Topsy are the most uniform bunch of daughters we have ever seen sired by a bull, and this sale offers a magnificent opportunity for a breeder who wishes to build up a foundation stock of the very best blood to buy all of these grand-daughters of King of the Pontiacs that we offer. It may be of interest that we have commenced the practice of weighing all of our heifers at the ranch at a certain age, and the average weight of all the heifers so far weighed at ten months' old has been 752 pounds. This is an increase of growth of about 30 per cent above the average for that age, so that buyers will know that when purchasing stock from us they will get nice growthy individuals possessed of a great constitution.

Among the good ones which we will mention that will be sold are Uneeda Korndyke Abbie, the second highest daughter for both milk and butter of her famous sire, the \$25,000 bull, Johanna McKinley Segis, whose dam is the 40-pound cow, Johanna De Kol Van Beers, who sold for \$7000 at public auction, the highest price ever paid for a dairy cow. Another is Abbie Korndyke Segis, a 21-pound three-year-old daughter of Johanna McKinley Segis.

MANURE FROM ONE COW

In experiments conducted at the Louisiana agricultural experiment station, says the Northwestern Stockman and Farmer, to determine the amount of manure and urine produced by the dairy herd of 20 cows in one year, it was found to be 175 tons of manure and 70 tons of urine. The average amount of manure produced by one cow in a year was 17,520 pounds, a little less than nine tons, and the average amount of urine produced by one cow in a year was 6935 pounds, or a little less than three and one-half tons. It takes little thought to see the value of a cow from the fertilizing standpoint or to see the profit in preventing unnecessary waste of manure.

THE NEW DAIRY QUEEN

How fleeting is the glory of a dairy cow queen is best exemplified by the eclipse cast over the yield of the erstwhile leader of the dairy world, FINDERNE HOLINGEN FAYNE, by her stable mate, FINDERNE PRIDE JOHANNA RUE, the new world's champion. The reigning queen, like her predecessor is one of the brilliant luminaries of the Holstein-Friesian breed, and her remarkable performance, announced June 16 last by the Advanced Registry Office of the Holstein-Friesian Association of America breaks all world's records for butterfat production, not only those of black-and-white cattle, but for all other breeds, by yielding in 365 consecutive days 28403.7 pounds of milk (13211 quarts) containing 1176.47 pounds of butterfat. The average yield per day, therefore, was slightly over 36 quarts of milk and four pounds of butter per day.

The Holstein-Friesian heifer, FINDERNE HOLINGEN FAYNE, the deposed

If the thermometer is 75 degrees or higher, wipe him all over with a damp sponge. Use vinegar water if possible. Do not turn the hose on him.

Saturday night, give a bran mash, lukewarm; and add a tablespoonful of saltpetre.

If the horse is overcome by heat, get him into the shade, remove harness and bridle, wash out his mouth, sponge him all over, shower his legs, and give him two ounces of aromatic spirits of ammonia, or two ounces of sweet spirits of nitre, in a pint of water; or give him a pint of coffee warm. Cool his head at once, using cold water, or, if necessary, chopped ice, wrapped in a cloth.

If the horse is off his feed, try him with two quarts of oats mixed with bran, and a little water; and add a little salt or sugar. Or give him oatmeal gruel or barley water to drink.

Watch your horse. If he stops sweating suddenly, or if he breathes

Entrance to University Farm at Davis.

queen, whose achievement was the world's record for the short period of but three months produced in a like period 24612.8 pounds of milk (11448 quarts) containing 1116.05 pounds of butterfat.

The new world's record cow, FINDERNE PRIDE JOHANNA RUE, calved at the age of five years, four months and four days. Her sire is JOHANNA RUE 3d's Lad and her dam is JONDINE PRIDE. She was bred by Bernard Meyer of FINDERNE, New Jersey, and is now owned by the Somerset Holstein Breeders Company of Somerville, New Jersey.

The test was made under the supervision of the New Jersey agricultural college. In a seven-days' test beginning 358 days after she calved, the new world's champion produced 602.4 pounds of milk and 28.831 pounds of butterfat, and for a second time established a new mark in the division of records begun not less than 240 days after calving.

HOT WEATHER RULES FOR THE HORSE

Load lightly, and drive slowly.

Stop in the shade if possible.

Water your horse as often as possible. So long as a horse is working, water in small quantities will not hurt him. But let him drink only a few swallows if he is going to stand still. Do not fail to water him at night after he has eaten his hay.

When he comes in after work, sponge off the harness marks and sweat, his eyes, his nose and mouth, and the dock. Wash his feet but not his legs.

short and quick, or if his ears droop, or if he stands with his legs braced sideways, he is in danger of a heat or sunstroke and needs attention at once.

If it is so hot that the horse sweats in the stable at night, tie him outside with bedding under him. Unless he cools off during the night, he cannot well stand the next day's heat.

NUTRITIOUS OLEO?

Broadly speaking, there are three kinds of fats, namely, body, milk, and vegetable fat. The energy value of these fats is about the same, but there is a great and important difference in their nourishing value. Chemical analysis shows that each one of these fats is made up of different fats and in varying proportions but it does not reveal any particular difference in the food value of these fats. Just why milk fat is more nutritious than vegetable or body fat has not as yet been explained. Experiments conducted by the Wisconsin station have shown that there is something in the milk fat that is not found in vegetable or body fat.

Dr. McCollum, who conducted this work, fed some rats pure protein, pure carbohydrates and fats. The protein was supplied by the casein of milk; the carbohydrates by milk sugar and starch; and the fats by olive oil, lard, and tallow. He found that the rats grew in a normal way, as far as could be seen, for three to four months, which is about one-third of their total growing period. They remained in this condition for many

Watch Out When Your Animals Are On Dry Feed

GILBERT HESS, Doctor of Veterinary Science, Doctor of Medicine

I want all you farmers to get this fact riveted in your mind regarding stock—that the only animals that are paying you a profit are those that are digesting their feed—bowels regular every day and absolutely free from worms.

And it is just at this very time of year when stock are not in that condition, because they are cooped up, deprived of exercise and for the last few months have been on dry feed, which does not contain the laxatives and tonics so abundantly supplied by grass.

DR. HESS STOCK TONIC

Aids Digestion Makes Stock Healthy Expels Worms

Being both a Doctor of Medicine and a Doctor of Veterinary Science I formulated Dr. Hess Stock Tonic to aid digestion, make stock healthy and expel worms.

This scientific, 22-year-old preparation contains highly concentrated tonics that improve the appetite and aid digestion, laxatives for regulating the bowels and vermifuges that expel the worms. There is positively nothing to equal Dr. Hess Stock Tonic as a worm expeller.

Remember, it's the cow in the pink of condition that fills the milk pail, the steer with an appetite that lays on fat, the horse that enjoys its dinner that pulls on the bit, the hog that is healthy and free from worms that gets to be a 200-pounder in six months.

So sure am I that Dr. Hess Stock Tonic will put your animals in a thriving condition, make the ailing ones healthy and expel the worms, that I have authorized my nearest dealer to supply you with enough for your stock, and if it does not do what I claim, return the empty packages and get your money back.

Dr. Hess Stock Tonic is never sold by peddlers—only reliable dealers; I save you peddler's salary and expenses, as these prices prove. West of Rockies: 25-lb. pail \$2.25; 100-lb. sack \$7.00. Smaller packages in proportion.

Send for my book that tells all about Dr. Hess Stock Tonic—it's free.

DR. HESS & CLARK, Ashland, Ohio

Dr. Hess Poultry Pan-a-ce-a

Asplendid tonic that tones up the dormant egg organs and keeps the hens scratching and happy and laying all through the winter. Shortens moulting period and promotes rapid feather growth. Nothing better to make chicks strong and healthy. Cheap—a penny's worth is enough to feed 30 fowl per day. Sold only by dealers whom you know. Never sold by peddlers. West of Rockies: 1 1/2 lbs. 25c; 3 lbs. 50c; 7 lbs. \$1.00; 25-lb. pail \$3.00. Guaranteed.

Dr. Hess Instant Louse Killer

Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks or, if kept in the dust bath, the hens will distribute it. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, slugs on rose bushes, etc. Comes in handy sifting-top cans. West of Rockies: 1 lb. 25c, 3 lbs. 60c. I guarantee it.

LAYNE & BOWLER PUMP

It was not until the advent of the Layne and Bowler Pump that the irrigator was assured of a constant and economical water supply. Let the World's largest water developers solve your pumping problems. Our irrigation booklet No. 30 gives valuable information. It's Free.

Layne & Bowler Corporation
900 Santa Fe Ave.
Los Angeles, Cal.

When writing advertisers, mention The Cultivator.

There is a Big Difference in Silage

THE SUCCULENCE AND PALATABILITY OF perfect ensilage produces maximum results at a low feeding cost.

NO OTHER FEED contains as much "succulence value" as well preserved ensilage.

IT IS THE MOST ECONOMICAL FEED for summer as well as for fall and winter.

BUT THERE IS AS BIG A DIFFERENCE in silage as there is in silos.

AN ABSOLUTELY AIR AND WATER TIGHT silo is needed to produce good silage.

IT MUST NOT LEAK OUT THE JUICES or admit the air to the silage.

TO MEET THESE REQUIREMENTS, a silo must be of such design, material and workmanship that it will be for many years just as serviceable as when first erected without it being necessary to rebuild every year.

THE IDEAL GREEN FEED SILO will keep ensilage as fresh and succulent all the year as the day the corn was cut.

ERECT AN IDEAL GREEN FEED SILO and stop silo troubles forever. Built of California Redwood, it will last a generation.

weeks without making further growth. When milk fat or fat extracted from the yolk of eggs was fed instead of lard, olive oil, or tallow, the rats resumed their growth. This shows that the fats of milk and eggs possess some property for growth and sustenance of life that are not contained in body or vegetable fats.

We must not lose sight of the fact that milk fat and egg fat are prepared to nurture young, and nature has given these fats a substance or substances not found in other fats. Butter is made from milk fat and oleomargarine is made from body and vegetable fats, therefore oleomargarine is not as nutritious as butter. Statements made by so-called food experts and by dealers in oleomargarine that oleomargarine is as nutritious as butter, are false. Science has come forth with a new verdict, and the person, whether he be chemist or food expert, who asserts that oleomargarine is as nutritious as butter because it contains about the same amount of energy, is asserting that which is not true, for the experiments conducted at the Wisconsin experiment station show that egg or milk fat is required to bring forth a full developed animal.—Hoard's Dairyman.

DAIRY CONFERENCE

The directors of the National Dairy Union, and others interested in the development of the dairy industry in this country, met in Washington, D. C., early in June for the purpose of outlining some definite action relative to the dairy legislation in the next congress. The main object of the conference was to perfect the oleomargarine legislation that has been before congress for several sessions.

The main features of the new bill which were decided upon are as follows:

The adoption of a color standard for oleo, and the prohibition of its manufacture or sale under any conditions when the degree of yellow coloring is greater than that prescribed.

The limiting of the amount of butter fat that may be incorporated in oleomargarine to 5 per cent.

The adoption of a uniform tax rate for all oleomargarine.

The other features of the bill were left in the same shape as the National Dairy Union had prepared in a measure introduced in congress nearly two years ago, known as the Haugen Bill.

The two plans of taxing oleomargarine ten cents for colored and one-fourth of a cent a pound for uncolored, has been the cause of much fraud practiced upon the government, and has been used to create a false impression that all oleo was paying 10 cents a pound tax, when the great bulk of it is only paying one-fourth of a cent tax. By prohibiting the coloring of oleomargarine, and a straight tax, the greater part of the deception and fraud will be stopped.

The Pennsylvania law, which prohibits the sale of margarine in imitation of yellow butter, proves the contention of the dairymen that uncolored oleomargarine sells for less money and is of better grade than when colored, and does in no wise interfere with oleo honestly manufactured and sold for what it is.

It is generally conceded that the time has arrived for oleo to be sold for what it is, and at the same time giving consumers a substitute for butter at a reasonable price, instead of paying excessive prices as has been the case too often in the past.

The probabilities are that oleo manufacturers who are anxious to sell their product on its merits at a reasonable profit will not oppose this measure.

Other matters discussed were the correct labelling of imitation evaporated milk products.

Veterinary Queries

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Spiders on Pigs

What can I do for my pigs? They have a small insect on them that looks like a small spider. They rub nearly all their hair off.—Subscriber, Olive.

There is a small red spider that sometimes get on pigs and is very annoying. Use a solution of zenoleum; 25 parts of water to one of zenoleum. Put it in a sprinkler and when they are eating is a good time to use it. You should also sprinkle the place where they sleep and the spots where they rub. Repeat this once a day for a week.

Infectious Eye Trouble

The cattle in a pasture in our neighborhood are affected with some eye trouble. It starts with a small white spot in the center of the eye and within three days the eye is all white and the animal becomes blind. In about a week a small spot in the center becomes depressed. The eye seems to be very painful and sensitive to the light. It is badly swollen but there is very little discharge. It will appear in one eye, and in about three days the other becomes affected. It does not seem to be contagious. The trouble is only in pastures where the stock get water in mud holes. Stock in adjoining pastures supplied with water from troughs are not affected. Hogs that have access to mud have the same trouble.—Subscriber, San Dimas.

The trouble is due to infection from a fungus or microscopic bacteria that must be in the wet land. The animals should be moved to a dry field and those that are affected should be separated from the well ones and treated. Wash out the eyes with warm water that has a little borax in it. Then with a camel's hair brush paint the eye with a five per cent solution of nitrate of silver. If ulcers form on the eye, dust it with calomel. Repeat the treatment once a day until they begin to clear up. The animals should be kept in a dark place, as the light causes pain and retards recovery. If it is necessary to turn them out for feed, then tie a cloth to the horns or halter so it will cover the affected eyes and keep the light out.

Oily Butter

We are having trouble in making butter. It is oily and will not separate from the butter-milk. Cow is about four years old and dropped her second calf five weeks ago. Appears healthy in every way and is in good condition. We are feeding alfalfa and oat hay, green corn, etc., beside some bran and rolled barley. The butter will not granulate and remains soft and oily. It hardens when we use ice, but soon melts down again. What can be done?—Subscriber, Orange.

We are inclined to think that part of the trouble is with the cow and part with the handling of the milk and cream. Butter that is made from cream that is too warm is inclined to be oily. The milk and cream should be kept in a cool place and should not stand over two days at this time of year. The cream and churn should be cooled to 62 degrees Fahrenheit and when the butter comes it should be washed with cold water. Work the salt in quickly and set in a cool place to harden. Change the condition of the cow by giving her a physic of aloin half an ounce, turpentine two ounces and raw linseed oil one quart. Mix and give at one dose. Follow with these powders. Powdered gentian four ounces, powdered nux vomica two ounces, bicarbonate of soda six ounces and enough fenugreek to make one pound. Mix and divide into 20 powders. Give one powder morning and evening.

Poultry for Profit

ECONOMY IN RAISING POULTRY

Written for California Cultivator

By E. Cauble

BUT few people raise poultry without some definite point in view, either for profit or to supply meat and eggs for their table. In order to make the industry profitable in any branch, it is necessary to use the greatest economy in every detail, yet this must not be a mistaken economy. The best economy is providing everything necessary for the flock to do their best. In the first place, good stock; second, good housing; third, sweet, clean feed and water; lastly, good care and cleanliness. The greatest mistakes in poultry culture are bad feed, cheap, spoiled or musty feeds not considered fit for anything but chickens, and overcrowding, which cuts down the profit on many good flocks; better have fewer hens and give better care; cull out often and keep only the choicest birds. It is also a mistake to keep anything but pure bred stock, as they lay more eggs, look better and sell better in the market, not considering the extra profit from hatching eggs and breeding stock. Pure stock can be had for the same price as mixed, so do not make such a mistake.

Housing

The cheapest and most serviceable house is the single slant roof facing the south, 14 by 16 feet wide, with half open front, rear wall five feet and front eight feet. This house makes a fine scratching shed for winter and is cool for summer. This style of house can be built for less than 75 cents per foot, has matched lumber for rear wall and droppings board. This will house 50 hens for every ten feet in length, using four roosting perches.

Care of Droppings Board

Much labor and time can be saved by the proper care of the droppings board. In winter or damp weather the droppings board should be generously sprinkled with air slaked lime to which has been added a handful of flowers of sulphur. This keeps down odor and facilitates the cleaning, also removes the necessity for cleaning so often, once a week being sufficient when lime and sulphur are used. This absorbs extra moisture

and prevents vermin from working in the droppings.

Gypsum is also a good absorbent for the droppings board and when mixed with the droppings makes a very valuable fertilizer. Gypsum is also a good shell producer and is very beneficial to the fowl's health when a little is used in the mash feed occasionally.

Feeding Economy

The hen must have sufficient feed

Sacramento, California State Poultry Association, Jan. 14-18, 1916, C. A. Wilkins, P. O. Box 1117, Sacramento, secretary.

at all times. If she is to be profitable as an egg producer she must not be overfed one day and starved the next, as this deranges her digestive organs and she cannot produce. Care in every detail of the feeding must be observed when hens are kept in confinement; their appetites must be satisfied, and to do this a variety of feed should be furnished. High priced feeds are not so necessary as a variety of green feed. Greens are cheapest and absolutely essential. However, alfalfa meal may be substituted with fair results but should be scalded for laying hens and fed dry in mash for young stock.

A hen should have sufficient feed to produce eggs and give a slight gain

in condition, otherwise she lays herself out of condition and stops producing till her condition becomes normal again, which may be six weeks or more.

Cracked grain in deep litter early mornings induces exercise and should be fed during winter if not at all times, but as most hens lay before noon, something that satisfies should be fed in the morning, and nothing yet has taken the place of a moist mash, and nothing can be made more cheaply and be as effective. Fifty per cent of this mash can be chopped green alfalfa, green barley, chopped green corn, fodder or most anything green at hand. When combined with bran and middlings or egg food and moistened with sour milk it makes an ideal mash, well relished, and sends the hens cackling to the nests. When feeds are as expensive as they are the present year it is all the more essential to give the fowls extra care, making each hen produce and keeping no more hens than you can give this kind of care. This season has been hard on the poultry industry for many reasons which we are not able to control, but as we are assured of a banner crop of all kinds of feed this season, the coming season without doubt will be a good one for poultrymen. Therefore do not make a mistake and let all your flock go; retain the best you have, raise a supply of pullets, as eggs will be up in price shortly, and by fall egg prices will soar and you will then want a nice flock which if well fed will be just as profitable as in former seasons.

NATIONAL EGG LAYING CONTEST AT MOUNTAIN GROVE, MISSOURI

Forty-five entries for the next contest have been received. The rules governing the contest are for free distribution, thus giving the breeders of all breeds and varieties the same opportunity to enter the contest. Therefore half of the pens are already taken. Those who wait to see how their pullets develop before entering are usually disappointed, for all pens are taken long before the contest begins which is November first.

One of the factors which determine egg production is the feed ration, not merely the quantity of feed given but the elements contained therein.

Many questions are asked as to what a balanced ration for egg production is and how to balance the ration. In order to determine more fully the effect of certain rations a number of experiments are in progress at this station. Each pen contains twenty hens.

The test with a wide ration, containing elements which would produce three yolks for each white, produced 379 eggs in the first six months.

The test with a narrow ration, containing elements which would produce two whites to each yolk, produced 269 eggs.

The test with a ration containing equal yolk and white material but without minerals to produce the shell, produced 161 eggs.

The test where the ration contained elements necessary to produce equally all parts of the egg produced 1603 eggs in the same time. This ration is called a balanced ration for egg production.

The yolk is principally carbohydrates; the white, protein; and the shell, minerals. Thus the three parts of the egg are made from three kinds of food.

The following ration is fairly well (Continued on page 114)

Meet your Business Face to Face

The Cultivator Poultry Book

Poultry for Profit

BY

Jean A. Koethen

Graduate of University of Calif.

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

Where is there a thoroughly successful business person, who did not first go over carefully all the ins and outs of his future business? The poultry business is your future business; meet it face to face with all its ups and downs explained thoroughly in the book "Poultry for Profit."

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on eggshell book, binding full cloth vellum de luxe, at the price of one dollar postpaid.

Order your copy NOW.

Equip yourself mentally FIRST.

Invest your capital LATER.

TREES

BEST ORCHARD HEATER KNOWN

CHEAPEST, GIVES BEST RESULTS, AND BURNS LEAST OIL. ALL OTHERS AWAY BEHIND. R. R. Snowden, Agent, 320 Stimson Building, Los Angeles, Calif.

Prices Reduced—Ganter and Harmon Avocados, 4 to 7 ft., extra fine field grown trees with large, even heads; on rented ground and must be sold. Our prices will surprise you. Citrus also reduced. Magnolia Nursery, Whittier, Cal.

For Acacias, Avocados, Budded Loquats, Citrus trees, Evergreens, Feijoa, Palms, Roses and all kinds of trees, shrubs, vines, etc. Write for our new catalogue. Robertson Nurseries, Fullerton, Cal.

For Sale—Eureka Walnut Trees, budded on Native Black Walnuts. Choice stock. Order immediately. Don't delay. Wm. Holve, Fullerton, Cal.

Avocado Buds—Challenge, \$10.00 hundred; Royal, Walker's Prolific, \$5.00; Taft, Harmon, Ganter, Northrup, \$2.00. C. E. Utt, Tustin, Cal.

Nurserymen—Pot grown conifers, palms, shrubs and ferns for lining out or potting. Ballou's Nursery, Pasadena, Cal.

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

Cactus and Trees—Cash Nurseries, Sebastopol, Cal.

MACHINERY

USED RANCH MACHINERY. PUMPS, WINDMILLS, TANKS, ENGINES. HAY MACHINERY, PUMPING PLANTS, TANKS, TANKS, TANKS. WHY BUY NEW? SAVE HALF. MATERIAL GUARANTEED. PUMPS, PIPE, CYLINDERS, RODS. DEMMITT CO., 120 N. Main, Los Angeles.

For Sale—Used and new Gas Engines, 2 H. P. up, rebuilt and fitted with modern equipment. 22 years' experience enables us to repair and rebuild Gas Engines correctly. Get prices. Lloyd, 806-808 N. Main St., Los Angeles. FT020—Broadway 4103.

For Sale—One 15 H. P. Western gas engine in good condition with fuel tank, all necessary pipe and fittings, batteries, etc. Also one Gould and one Price No. 4 horizontal centrifugal pumps. Cheap. Hugh T. Thomson, Orange, Cal.

POULTRY

Just Out—The Cultivator Poultry Book. "Poultry for Profit," by Jean A. Koethen. Published by the Cultivator Publishing Co. Highly endorsed by experts. Over 200 pages, 50 illustrations. Contains simple methods of avoiding and overcoming difficulties. A guide to poultry success under Western conditions—it tells what to do, why to do it, and how to do it. Nicely bound in cloth. Price \$1.00 postpaid, or with Cultivator one year, \$1.75. Send orders to Cultivator Publishing Co., 115-117 North Broadway, Los Angeles, Cal.

Baby Chicks—Rhode Island Reds and White Leghorns. My guarantee safe arrival, full count, strong, vigorous; fine bred chicks, Leghorns, \$9.00 per 100. Will lay in five months. Reds, \$11.00 per 100. Will lay in six months. J. W. Lyon, Gardena, Cal.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. National Poultry Co., 607 E. Third St., Los Angeles, Cal.

Baby Chicks—Electric Hatched. White Leghorns, R. I. Reds, Barred Rocks and Black Minorcas. We are booking orders for Fall and Spring delivery. THE ORLAND HATCHERY, Orland, Glenn Co., Calif.

We can supply you with March hatched S. C. White Leghorn cockerels from champion layers. Every hen on the ranch trapped. Our aim—full value, quality and satisfaction. \$1 and \$1.25 each. Hudson Bros., Escondido, Cal.

First-Class Chix—White, Brown Leghorns, R. I. Reds, B. P. Rocks, Buff Orpingtons for September and later. Stock guaranteed. Hawkeye Hatchery, Turlock, Cal.

MISCELLANEOUS

Free for Six Months—My special offer to introduce my magazine "INVESTING FOR PROFIT." It is worth \$10 a copy to anyone who has been getting poorer while the rich, richer. It demonstrates the REAL earning power of money, and shows how anyone, no matter how poor, CAN acquire riches. INVESTING FOR PROFIT is the only progressive financial journal published. It shows how \$100 grows to \$2200. Write NOW and I'll send it six months free. E. L. Barber, 430, 28 W. Jackson Blvd., Chicago.

By having no expensive catalogue we can sell direct to you through our merchandise sales department standard lines of diamonds, watches, jewelry, tools, implements, hardware, sporting goods, etc., at money saving prices. Write us as fully as you can as to just what you want, and we will send full description, and prices that will interest you. Address Newton Poultry Farm, Dept. B., Los Gatos, Calif.

"Smith's Pay the Freight"—To reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

MUSICAL INSTRUMENTS

Special Piano Offer to country buyers, for a short time only. Any piano or player piano at \$100.00 special discount. Ten different standard makes, styles and finishes to select from. Act quick. Address GIRARD PIANO COMPANY, 517-519 14th St., Oakland, Cal. Established 1873.

We repair, buy, sell and exchange musical instruments; used instruments, good as new, sold cheap. Write for bargain list. Bolander's Fiddle Hospital, 52 Second street, San Francisco.

LIVE STOCK

I have another crop of seventy-five head of BIG TYPE POLAND CHINA BOARS, born in February, sired by IOWA WONDER, who is a son of A WONDER, the GREATEST POLAND CHINA BOAR, LIVING OR DEAD. IOWA WONDER is in the 1000-LB. CLASS. One of his sons from one of my good registered sows should make YOU MONEY. I will sell the best first. On account of being overstocked will sell them at \$20 each while they last, but they will not last long at this price, so ACT QUICK if you want an EXTRA GOOD BOAR FOR LITTLE MONEY. Geo. A. Smith, Corcoran, Cal.

Billiken Herd—Pure bred, pedigreed O. I. C. swine; the big white kind. Ready for immediate shipment; weaned pigs of both sexes; pairs and trios; mated not akin. All these pigs are from big type stock, of extra heavy bone; weight, with early maturing quality. Immunized against hog cholera; crated and registered free. Write for descriptive circular and price list. C. B. Cunningham, Mills, Sacramento County, California.

Grape Wild Farm Thoroughbreds—Guernsey Bulls of A. R. B. breeding. BERKSHIRE HOGS. Finest Lard in the state. All ages for sale. A. B. Humphrey, proprietor. Mayhews, Sacramento Co., California.

Cholera Immune Berkshire Pigs—All ages. Registered Holstein bull. Prairie Pieter 107062, three years old—gentle and guaranteed. Selling to avoid inbreeding—\$300.00. Ricconi Bros., Mountain View.

For Sale—Registered, Berkshires. 25 choice pigs of best breeding from the best strains in America. For prices and description address H. L. Murphy, Perkins, Sacramento Co., Cal.

Hogs—A few thoroughbred Hampshire Boars for sale. Reasonable prices. L. P. Conway, P. O. Address, Sawtelle, California. Sunset Phone, Santa Monica 565 M.

For Sale—At all times, Jacks and Stallions, driving and saddle horses. Price and stock guaranteed. Phillips and Kingsbury, 2318 G Street, Sacramento.

Berkshires—Pedigreed Boars ready for service. Bred sows, weanling pigs, both grade and thoroughbred, finest stock. C. H. Thompson, Novato, Cal.

For Sale—Bred sows and gilts. All cholera immune—and extra choice large stock. Main 1326—F-6350. Mr. Hill, 429 Union Oil Bldg., Los Angeles, Cal.

Calves Raised Without Milk—Cost less than half as much as the milk raised calves. Write for free book to Coulson Co., Petaluma, Calif.

Poland Chinas—Young stock; either sex. Write for pedigree. Reasonable prices. Edw. A. Hall, Watsonville, Cal.

Glennview Poland China—Stock for sale. Chas. R. Hanna, R. F. D. No. 3, Riverside, Cal.

Poland China Bred Sows—Bred gilts and 4 months old pigs for sale. D. M. Clark, Arlington, Calif.

For Sale—Thoroughbred Duroc Jersey Boars and Gilts, strong and vigorous stock. Fred Hart, Exeter, Cal.

For Sale—Prize Winning Shetland ponies. Selling out. Priced worth the money. Maurice Rucker, Fair Oaks, Cal.

Berkshires—Boar pigs for sale, Butte City Ranch, Butte City, Glenn Co., California. N. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

SCHOOLS AND COLLEGES

Wanted—About seventy-five young men and women to enter The WESTERN NORMAL on August 30th, to prepare for teaching. Western Normal graduates secure and hold good positions. We assist graduates to secure good positions and promotion. We save you time and money. For information, address, WESTERN NORMAL, J. R. Humphreys, Principal, Stockton, Cal. 634 E. Main St.

Telegraphy—Stenography, bookkeeping, English branches. Positions guaranteed. Mackay Business College, Los Angeles

RABBITS

Leading Rabbitry in America—Flemish Giants a specialty. Prize winning and heavy weight stock. Scored and sold on their merits. Inquiry and inspection solicited. Catalogue on request. Empire Rabbitry, Empire, Cal.

Bosworth's Imperial Red New Zealand Hares sold at hard times prices. NOTHING BETTER. Geo. M. Bosworth, Geyersville, Cal.

Caldwell's Royal Red New Zealand scored and sold on merit. Catalog free. Caldwell Bros., Box 613R, Los Angeles.

SEEDS AND PLANTS

For Cattle, Hog and Poultry Forage plant now Luther Burbank & Mediterranean Spineless Cactus. ROBINSON CITRUS NURSERIES, R. F. D. 35-A, San Dimas, Cal.

Burbank Spineless Cactus—Hardest varieties, "Melrose" and "Special." Strong, matured slabs. \$8.50 per 100; \$50 per 1,000. Labranza Ranch, Athlone, Merced Co. Cal.

For Sale—Burbank Spineless Cactus, at prices you can afford to plant them for feed. Send for catalog. S. A. Moore, Huntington Beach, Calif.

DUCKS

Ducks—High Class Mammoth Imperial Pekin Ducks for breeders. Also young ducks and eggs for sale. Best stock in California. Stone Canyon Poultry Farm near Sawtelle, California. P. O. Address, Sawtelle. Sunset phone, Santa Monica 565 M.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles.

FARM LANDS FOR SALE

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

For Sale Cheap, residence lot 50x120, at East San Diego Villa Heights, will let it go for \$100.00; good title guaranteed; act quick. Address Box No. 43, Palermo, Calif.

WANTED

Wanted—To hear from owner of good farm or unimproved land for sale. C. C. Buckingham, Houston, Texas. Wanted to hear from owner of Farm or Fruit Ranch for sale. O. O. Mattson, Minneapolis, Minn.

TURKEYS

Eleven White Holland Turkey Hens and one fine tom. All mature birds and strong breeders. Excellent layers. H. McKusick, Box 733, Calexico, Cal.

KODAK FINISHING

Developing, 10c per roll. Printing, 2 1/2 x 3 1/4, 2 1/2 c; 2 1/2 x 4 1/4, 3c; 3 1/4 x 4 1/4, 3c; 3 1/4 x 5 1/2, 4c. Denver Store, 706 S. Hill St., Los Angeles.

JIMSON WEED

You can get 1 1/2 cents a pound for the fresh picked leaves. We pay cash and the freight besides. Write for particulars. Haas Seed Co., 1800 Lincoln Ave., Pasadena, Cal.—Adv.

NATIONAL EGG LAYING CONTEST

(Continued from Page 113)

balanced for egg production. Instead of using the terms "carbohydrates" and "protein," the terms "yolks" and "whites" have been used. All fractions are omitted, therefore the table is only approximately correct.

Grain.	Lbs.	Yolks.	Whites.
Cracked corn....	150	382	198
Wheat	150	365	273
Mash			
Wheat bran.....	20	31	41

Questions

THE EDITOR

and Answers

AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Curing Lemons

Is there a simple formula for curing lemons by means of borax?—Subscriber, Colusa.

We do not understand what our subscriber means by "the use of borax." The only process used in the large packing houses of the state is to simply hold the lemons in storage until the demand calls for them. In this storing the rind is somewhat thinned and made flexible or cured. Where lemons are grown on scale-infested trees and are picked covered with smut then they are washed, and in the washing borax and soap powder are sometimes used. So far as curing for home use is concerned, we have seen some of the finest lemons kept indefinitely by being carefully picked from the tree, put in layers alternating with wet sand. This prevents evaporation, and we have seen lemons taken from such a pack three or four months after storing with an almost perfect kid-glove texture.

Sudan Grass as a Feed

An inquirer wishes information as to whether Sudan grass, being one of the sorghums, might not have the same fault which the latter have of developing at times prussic acid or certain poisonous substances which cause death of stock. The matter was referred to others, and Prof. Woll of

The hens had access to oyster shell and grit and were given two pounds of fine table salt and four pounds of fine charcoal in the above mash.

The basis for computing the number of yolks and whites produced by each kind of feed was that one pound of carbohydrates would produce 3 1-3 yolks; one pound of protein would produce 16 2-3 whites, this being the rate of the average hen here at the station.

It will be seen that from 150 pounds of corn 382 yolks and 198 whites are produced, therefore it is not a balanced ration. The extra yolks are built into fat. In this way hens fed on corn alone get extra fat, and we hear the old expression that "the hen is too fat to lay." The expression should be changed to read, "The hen can't lay is the reason she gets too fat."

A simple ration may be made as follows:

	Yolks.	Whites.
150 pounds cracked corn.	382	198
150 pounds wheat.....	365	273
25 pounds beef scraps..	25	275
Totals	772	746

This ration would give best results where the hens have free range, because it contains no mash, thus requiring the hen to do the grinding of the food. The kind of food she gets on the range should be considered, however.

If a hen has the ability to produce 24 eggs in one month when fed a balanced ration, but is fed an unbalanced ration like corn alone, which produced two yolks for each white, instead of making 48 yolks in order to produce 24 eggs, she makes only the 24 yolks, but can complete only 12 eggs. The same thing is true of the whites. It is the same proposition of "no chain being stronger than its weakest link." No hen will lay more eggs than the weakest part of the feed ration.

the state university writes in effect that this grass has been so recently introduced that it has not yet been tested in this particular. He knows of no instance in which poisoning has resulted from its feeding, but suggests that under certain conditions it may prove more or less poisonous, as is common with some of the sorghums. He would advise careful observation, especially when feeding green, second growth Sudan grass or when pasturing after periods of extreme drouth when the plants are stunted and afterwards caused to grow.

Diseased Beans

I enclose specimen of bean plant that is affected with some disease. The entire field is affected and the trouble seems to be becoming worse each day. If possible, please give cause and cure.—Subscriber, Laton.

The plants were sent to the pathological laboratory at Whittier, and Mr. Clayton O. Smith answers: "I find the beans are affected with a root fungus, Rhizoctonia. No practical remedy for this trouble is known. All diseases of plants beneath the surface of the soil are difficult to treat."

Knots on Alfalfa

I mail roots of alfalfa. My nine-acre field is generally affected and is killing out in spots. The fields adjoining are not affected. What is the cause and what may I do to cure it?—Subscriber, Potter Valley.

Mr. C. O. Smith of the pathological laboratory answers: "The alfalfa

knots are caused by a fungus, Urophlyctic alfalfa. This trouble is aggravated by excessive moisture in the soil. Allow the ground to dry out thoroughly in the affected spots and do not use it again for some time."

Making Over Orchard

In changing a 14-year-old navel orchard over to Valencias, would it be advisable to interset the Valencia trees? At what age should the navels be removed?—Subscriber, Whittier.

If the root stocks of the navels are in good, healthy condition, it seems to us that the quickest way to make over this orchard would be to bud the old stocks. It is very difficult to plant young trees in a bearing orchard and get them to start satisfactorily. One may dig holes so as to destroy the roots of the old orchard trees for some distance around the young trees, and by giving them plenty of moisture and fertilizer possibly fair results may be obtained, but at best the growth will be somewhat indifferent as long as the old trees remain in the ground. It would probably not be best to leave the old trees longer than one or two years after the planting of the new before they should be removed entirely. In budding, one would perhaps lose three years, and then, if the stocks are vigorous and the budding has been done by careful and expert workers, the new orchard should be almost in full bearing. Navels should not be removed till they are perhaps a hundred years old, but under modern methods of culture that length of useful life may not be possible. How to hold our orchards up to full production is a question now being discussed by every orchardist. If the navels are being replaced because of exhaustion or deterioration, then we would assuredly remove the trees and put the land in fit condition again by heavy fertilizing and growing annual crops for a period. If they have ceased to be productive the soil probably holds the answer as to why.

Growing Onions

Please give information as to growing onions and whether they will do well in this section, about six miles west of Corona?—Subscriber, Corona, Riverside County.

We take it that "six miles west of Corona" would bring the location of the bottom lands along the Santa Ana River, and in that case presume the section is admirably adapted to onion culture. However, only a knowledge of the particular tract would enable us to answer this question definitely. Rich, dark, peat-like lands are usually required for best results. Heavy adobe lands, however, are not adapted to onion culture. As to suggestions for onion culture, would refer our subscriber to the Cultivator of March 4, 1915, containing reprint of an article by Mr. Murdock; also article on the growing of sets, by H. R. Mitchell, appearing in the issue of July 8.

Diarrhea in Calves

Have diarrhea among my calves. What can I do to stop it? Am using lime water and feeding to the worst victim an egg beaten in a pint of milk twice a day.—Subscriber, Owensmouth.

For answer we quote from "Diseases of Cattle," issued by the United States department of agriculture: "Calves which suck their dam are not frequently affected with this disease, though it may be occasioned by their sucking at long intervals and thus overloading the stomach and bringing on indigestion, or from improper feeding of the dam on soft, watery, or damaged foods. Suckling the calf at irregular times may also cause it. Exposure to damp and cold is a potent predisposing cause. Calves which are separated from their dams and which receive considerable quantities of cold milk at long intervals are liable to contract this form of indigestion. Calves fed on artificial food, used as a substitute for milk, frequently contract it. Damaged food, sour or rotten milk, milk in dirty cans, skim milk from a dirty creamery skim milk vat, skim milk hauled warm, exposed to the sun, and fed from unclean buckets, may all cause this disease. The calf is depressed, appetite poor, sometimes there is fever; the extremities are cold. The

dung becomes gradually softer and lighter in color until it is cream colored and little thicker than milk. It has a most offensive odor and may contain clumps of curd. Later it contains mucus and gas bubbles. It sticks to the hair of the tail and buttocks, causing the hair to drop off and the skin to become irritated. There may be pain on passing dung and also abdominal or colicky pain. The calf stands about with the back arched and belly contracted. There may be tympanitis. Great weakness ensues in severe cases, and without prompt and successful treatment death soon follows. In treating the disease first remove the cause. Give appropriate food of best quality in small quantities. Make sure that the cow furnishing the milk is healthy and is properly fed. Clean all milk vessels. Clean and disinfect the stalls. For the diarrhea give two raw eggs, or a cup of strong coffee, or two ounces of blackberry brandy. If the case is severe, give one ounce of castor oil with a teaspoon of creolin and 20 grains of subnitrate of bismuth. Repeat the bismuth and creolin with blackberry brandy and flaxseed tea every four hours. Tannopin may be used in dose of 15 to 30 grains."

Aphis on Watermelon

We send watermelon leaf covered with insects. What are they? They

have killed cucumbers and are now on the melons. Have tried soapsuds, air slaked lime, etc.—Subscriber, Ceres.

This is simply a serious infestation of aphis. If when they first appeared the vines had been burned without scattering the insects it would possibly have saved the other plants, though it is also possible they might have come from infested weeds around the field. These insects are usually killed by the use of tobacco sprays, formulas for which have been given in former Cultivator.

Auto for Pumping Water

Would like to hear from readers of the Cultivator as to their success, or otherwise, in using a Ford or other automobile for pumping water for irrigation. Supposing a turbine pump was used how would the belt be arranged to the best advantage?—D. K. Saddler, Stockton.

Doubtless there are many automobile owners in California who are using power from their machines after the manner suggested by Mr. Saddler of Stockton and we are going to pass this inquiry on to them and ask for suggestions as to how best to connect up the auto to give power for use on the ranch. Will be glad to purchase the first good photograph which any subscriber may send to us illustrating method of using the auto for power.

The Cultivator aims to be the paper for the farmer and by the farmer. Our best hints come from the practical field workers. We believe this suggestion should bring from these practical workers just what this subscriber is asking for.

Trespassing Chickens

How can I keep my neighbors chickens off my ranch? They destroy my crops. May I be permitted to shoot or poison them?—Subscriber, Los Angeles.

We believe that shooting or poisoning your neighbor's chickens or stock of any kind would give grounds for a suit to recover the value of the stock. If your place is surrounded by a substantial fence and you can make a showing of actual damage caused you can recover such amount of damage as you can prove. We believe also you can proceed under the estray law and ask that any stock which is at large be impounded.

BIG DEBTS

Very black, very small, and very much impressed with the importance of her mission, she stood before the kindly lady of the house.

"Well, Ophelia?"

"I've de washwoman's little girl, an' mommer, she says, please len' her a dime. She got to pay some bills."—Southern Woman's Magazine.

Important Announcement to Dairymen

NOW IS THE TIME TO PLACE YOUR ORDER FOR THIS SEASON'S SUPPLY OF

LARROWE'S

OWING to the enormously increasing demand we suggest that you place your order with your feed dealer now, for your season's requirements, to avoid possible disappointment.

Those who have used this succulent, milk-producing, vegetable feed and know the certain and profitable results obtained by its use, do not need to be told of its richness in carbohydrates and its general desirability as a ration for dairy cows.

To those who are not using LARROWE'S DRIED BEET PULP we will gladly send evidence of remarkable results obtained by prominent dairymen and feeders, together with valuable suggestions concerning feeding.

GET 1 TO 5 LBS. MORE MILK FROM EACH COW

If you are feeding an exclusive diet of alfalfa, just try the addition of Larowe's Dried Beet Pulp and see what a difference it makes. Not only will it increase the milk flow one to five pounds per cow a day—the increase being noticed almost immediately—but it will make your cattle healthy, sleek-coated, bright-eyed and prolong their milking periods.

Larowe's Dried Beet Pulp is light, bulky, succulent and easily digested; absorbs water very quickly and swells to about six times its original bulk; is cheaper than bran and other mill feeds, yet produces better results.

It is put up in convenient 100-lb. sacks, and may be had either plain or with molasses. Ask your dealer for "Larowe's."

WRITE FOR OUR BOOKLET—"PROFITABLE FEEDING"

—containing valuable information on feeds and feeding together with instructions for feeding dried beet pulp. Sent free on request. Address:

THE LARROWE MILLING COMPANY

LOS ANGELES, CAL.

Vanilla Ice Cream

Try This Recipe and Preserve
for Future Reference

What more welcome treat can you offer the folks at home these hot days than a nice cold dish of good ice cream? The number of different flavors in which ice cream is made at the present time is surprising, but the old-fashioned vanilla flavor still remains the favorite with the great majority. The following recipe for making vanilla ice cream, therefore, should be preserved in every home.

One cup sugar, $\frac{1}{2}$ teaspoon salt, 1 tablespoon cornstarch, 1 pint milk, 1 or 2 eggs, 1 pint cream. Mix the cornstarch with the sugar, and add to the slightly beaten eggs. Pour on the milk slowly, add the salt, and cook over water until thoroughly done. When cold, add the cream and freeze, flavoring with vanilla to taste.

While all the ingredients in ice cream should be good, the results will not be satisfactory unless the best quality of cornstarch is used. One of the best known woman writers in this country on culinary subjects says that those who have the best success with cornstarch recipes always depend upon the famous Kingsford's brand.

Kingsford's Cornstarch has stood the test of time. It costs no more than inferior kinds. Insist upon Kingsford's and ask your grocer for the little Corn Products Cook Book, which contains hundreds of valuable culinary hints.

Hot Weather Pests

Ants One of the Most Aggravating Annoyances

Hot weather means different things to different people, but it always suggests one very disagreeable thing to the housewife—and that is ants.

Ants are small and unassuming but they are busy all the time, and have an unhappy faculty of intruding themselves where they are not desired.

What could be more annoying than to have a mess of ants over-running the food you are about to serve your family or guests?

Women everywhere will hail with delight, therefore, the announcement that a simple remedy has at last been devised that will rid them of this plague forever.

A baker in Los Angeles, after much experimenting, devised a paste which not only drives ants out of a house, but keeps them out thereafter.

So great a demand was immediately created that it was necessary to put up this remedy for general use under the name of Kellogg's Ant Paste—which can be obtained at all modern grocers or druggists. Try a package today and watch the results.

THE TALE OF A GENIAL CUSS

By Ralph Bacon, Banning

Once in the shade of a giant gray cactus
Far out on the sands where the burros had packed us,
We met a particularly genial cuss
Who cocked up his head and sat down by us
And gazed us all over from spurs to sombrero,
As cool as a veteran lookout at faro.

If he had any kicks or comments in mind
To expressing the same he was much disinclined;
He was lazy and fat and sat on the sand
As flat and as still as the palm of your hand,
For this genial cuss we had met on our road
Was our very old friend, the desert horned toad.

A most cheerful chap, and when he is sunning
Himself on the sand, he looks mighty cunning
With his mild little eyes looking straight at the sun
He seems to be dreaming of deeds he has done
In far-away antediluvian days
When he swam, a great monster, in bayous and bays
That bordered the edge of the vast Salton Sea
And fought pleiosaurus and killed it maybe!

But, alas, for all dreamers who live in past glories,
They cut little ice in our present-day stories—
For just as our horned toad was dreaming of battles
Up came an old snake with about forty rattles
And before the horned toad in his dreaming had known a
Thing was amiss, he'd gone down like a Jonah!

Now we felt mighty sorry to see him die thus—
For that little horned toad was a genial cuss—
And decided as soon as we'd stowed in our grub
To work on that snake with a four-year-old club;
But before we got ready it was plain for to see
The horned toad and rattler didn't agree.
The latter went bucking and coiling and raring,
His forked tongue a lolling, his eyeballs a flaring,
Till, all of a sudden, he come square in two
And Mr. Horned Toad blinked "How do you do?"
With the little saw teeth on the top of his head
He'd cut through that snake when we thought he was dead.

Now there's many a dreamer's a genial cuss,
Who never begins a row or a fuss
Unless you swallow him, same as snakes do—
When he starts in and calmly cuts you in two.

A LONG WADDLE

A pair of wild ducks recently built their nest on the northern side of the boating pond, in the middle of Central Park, in New York City. That is no place, however, for a mother duck to bring up a family, for on spring and summer afternoons a gasoline launch goes chugging around the lake, and young people paddle boats here and there with splashing oars, and little children play near the water; yet in due time eight timid ducklings appeared.

The little brown mother must have had some terrible fright one spring afternoon. She hastily decided that she would lead her family to the "breeding pond," nearly a mile away, at the lower end of the park. There her ducklings would be safe, for the park authorities have inclosed the water with a fence of wire netting, so that the swans and other varieties of aquatic fowl may rear their young in comparative seclusion.

But the little ducks could not fly, and the entire distance to be traversed was through the most frequented part of the park. Because the journey had to be made on waddling little feet, it called for confidence in man that was appealing and wonderful.

The straggling downy line formed at the margin of the boating pond, and started to waddle across the broad circular esplanade. In the center of this promenade there is a splashing fountain. When the duck and her little ones had reached that point, a crowd of children and men and women began to form; and as the procession continued on its way, the escort grew larger and larger.

When the little brown mother had led the ducklings as far as the great arch beyond the fountain, she confidently piloted them through the ice cream restaurant and past the soda water fountains, where many people sat at tables.

Then came one of the most difficult achievements in the journey. For after the family had passed the restaurant, they encountered two long flights of steps. Up these the bunches of fluffiness, encouraged and urged forward by the mother, fluttered, with many a tumble. At last the line of nine waddlers reached the top of the stairs, and here policemen formed themselves into an escort; henceforth the procession had an official guard of honor.

Beyond the stairway is a park road, on which many automobiles and carriages passed rapidly up and down. These the police halted until the mother had led her family across.

Then came the asphalt paved mall, with countless baby carriages, hundreds of children at play, and donkeys dragging little carloads of girls and boys. Through all this teeming press the police opened a narrow canyon for the trusting little mother and her quacking brood. The crowd jostled behind, but no one offered any hindrance. And all the while it was clearly evident that the wise brown leader knew exactly what she was about, and where she wished to go.

Down the mall the mother quietly waddled, while her babies kept up an excited interchange of quacking comments, and nearly twisted their little heads off in their curiosity at the wonderful sights round them.

When they had safely traversed the long mall, they came to the wide driveway beyond. The mounted police stationed there blew their whistles and waved their arms; and the traffic—carriages, motor cycles, automobiles, and riders—came to a standstill until Mrs. Duck and the eight ducklings were over.

Beyond the last broad drive the mo-

ther led the way into the shrubbery and bushes; and there the little procession, still quacking sociably, left behind the police and children and men and women who had formed their numerous escort. When they reached a bridge over the "breeding pond," still waddling in proper alignment they slipped down to the water; and then off they paddled headed for the tempting seclusion of the farther end.—Youth's Companion.

REFRESHING SUMMER DRINKS

A cool refreshing drink makes the hottest summer day seem if not cool, at least less warm; and there are many kinds of summer drinks besides the well known iced tea and iced coffee. Here are some of the best of them:

Fruit Punch.—Mix together one cup each of water and sugar, boil ten minutes, and skim the syrup carefully. Add one cup of hot, strained tea, one cup of any fruit juice that you prefer, and the juice of five lemons and six oranges. Add sufficient water to make a gallon, and serve it ice cold.

Ginger Ale.—Put one quart of chipped ice into a gallon jug, add one pound of sugar and one tablespoon of strong ginger, and shake the mixture well together. Add one pint of good cider vinegar, and fill the jug with water. Keep it on ice until it is very cold.

Raspberry Vinegar.—Pour two quarts of vinegar over four quarts of raspberries. Cover it, and put it in a cool place for two days. Strain the juice through cheesecloth, and pour it over four quarts of fresh berries. Set the mixture aside again for two days, then strain it a second time through cheesecloth, and add three quarts of sugar. Heat it slowly, and skim the liquid until it is clear; then boil it twenty minutes. Seal it in sterilized bottles. When you serve it, use two tablespoonfuls of the syrup to a glass of ice water. It is a most refreshing drink on a hot day, and will keep for years.

An Egg Drink.—Beat three eggs thoroughly, add six tablespoonfuls of sugar, and one and one-half cupfuls of ice water. Whip into the mixture the juice of one orange and a small amount of the grated rind. Serve it in glasses topped with whipped cream.

Grape Cordial.—To one quart of rich, unsweetened grape juice add one-quarter of a cupful each of cold water and sugar syrup, and one-half of a teaspoonful of grated nutmeg. Just before you serve the drink fill the glasses two-thirds full of crushed ice, and pour the cordial over it.

Currant Shrub.—Heat two quarts of ripe currants and strain the juice through cheesecloth. To every quart of juice add three-quarters of a pound of sugar and stir the syrup until the sugar dissolves. Add the juice of one lemon and enough cold water to dilute the syrup. When it is cold, pour it over cracked ice, and ornament each glass with a slice of lemon or a bunch of ripe currants.

Lemon Mint.—Wash the mint well and pick off a large cupful of the leaves. Put them into a stone jar with one quart of chopped ice. Stir the mixture until the leaves are thoroughly bruised and the flavor is extracted. Strain off the water, and add the juice of two oranges and six lemons, and one pint of sugar. Put it on ice, and when it is thoroughly cold serve it in tall, thin glasses, with a sprig of fresh mint and a very thin slice of lemon in each cup.

Lemonade for a Week.—Boil together two quarts of water and four cupfuls of sugar for ten minutes. Remove the syrup from the fire, and add four and one-half cupfuls of lemon juice. Let the mixture cool, then seal it in glass jars and put it in a cool place. When you want to make lemonade, dilute a little of the syrup with ice water.

Lime Punch.—Put eight cubes of sugar in a bowl and pour over them the juice of two limes and two oranges. Add one and one-half cupfuls of cold water, and when the sugar is melted, chill the syrup with cracked ice. Just before serving it add a slice of pineapple and a few crystallized cherries. The receipt makes only a small amount of punch. For a large company it should be trebled.

Ginger Punch.—To one-third of a pound of preserved ginger add one quart of water and one cupful of sugar, and boil the mixture for fifteen minutes. Let it cool, then add one-half of a cupful of lemon juice and one cupful of orange juice. Strain the syrup through a jelly bag.

Milk Shake.—Flavor rich milk—or, if preferred, half milk and half cream—with vanilla, and add the well-beaten white of one egg and sugar to suit the taste. Put the milk into a screw-top jar or bottle, and shake it until it foams, but not hard or long enough to make it buttery. Pour it into glasses, and sprinkle grated nutmeg on top.—Youth's Companion.

USE LEMON JUICE

Mrs. P. J. Dreher of Pomona urges the more general use of lemon juice by those who care for its delicious flavor in their food. She thinks one of the finest dressings for lettuce leaves and many other salads is the French dressing, made with lemon juice instead of vinegar, using equal parts of olive oil and lemon juice. The juice is expressed and the oil added slowly, beating with an egg beater as in making mayonnaise. Of course one may add salt and other condiments desired.

In addition, Mrs. Dreher finds that adding the juice of one-half a lemon to the water in which green corn is boiled aids in keeping it white and

Cooking Fruit in Syrup

Information of Interest to Women Who Do Their Own Preserving

At this season of the year, when women all over California are either preserving or getting ready to preserve, the following directions for cooking fruit in syrup will prove of special interest:

Wash the fruit and remove imperfections; pare, stone, etc., as necessary. Make a syrup of the boiling water, corn syrup and sugar. Drop in the fruit and cook slowly until soft enough to pierce with a knitting needle. The fruit should be thoroughly sterilized in order that it should keep. Drop fruit into sterilized cans; strain the boiling syrup over the fruit. Insert the handle of a silver spoon between fruit and jar to allow air to escape. Fill jar to overflowing, wipe off rubber ring, fit cap onto jar and seal quickly. Invert jar to be sure that it does not leak.

If these instructions are followed carefully and a good quality of corn syrup is used, the results will be very satisfactory. The best domestic science schools recommend the use of the brand of syrup known as Karo (Crystal White) in preserving. The natural flavor of the fruit is much more apparent, and a heavy syrup is obtained without the cloying sweetness of the all-sugar syrup. Insist upon Karo (Crystal White) and ask your grocer for the little Karo Preserving Booklet.

she thinks it is made more tender and delicious. Use lemon juice instead of vinegar.

TRAVEL BOOKS BY UNCLE SAM

Under the heading "Travel Books by Uncle Sam," the United States Department of Agriculture is entering the realms of exploration and history, much of it, of course, in connection with agriculture, and suggests some very interesting publications which are obtainable from the Superintendent of Documents at Washington rather than the department.

"Geography, Travel, Exploration," is the title of a new free price list just issued by the Superintendent of Documents, Washington, D. C., in which are enumerated many government publications containing information regarding places at home and abroad. Any one of the publications may be had by forwarding a nominal sum covering cost of issue, to the office of the superintendent. Prices range from 3 cents to \$9, most of the sums, however, being less than \$1.

Numerous pamphlets listed in this collection describe different parts of the United States and its territories, geographically, geologically, and historically. Among these are such special pamphlets as:

"Origin of Certain Place Names in the United States." Price, 20c.

"Secret of the Big Trees of California." Price, 5c.

"Reports of the Governor of Arizona." Prices ranging from 5c to 25c each. (These contain information about prehistoric ruins, canyons, climate, resources, etc.)

"Areas of Acquisitions to Territory of United States." Price, 25c.

"Areas of United States, States and Territories" (with map). Price, 10c.

"Old Maps Relating to America." Price (cloth), \$1.50.

"National Reservations for Protection of Wild Life." Price, 5c.

"Aurora Borealis, Its Phenomena and Laws." Price, 70c.

"Icebergs and Their Location in Navigation." Price, 85c.

"Papers Relating to Improvement of Washington, D. C." Price (cloth), \$1.00.

Among Uncle Sam's miscellaneous pamphlets and books dealing with other lands are such as:

"Mediterranean Peoples." Price (cloth), \$1.75.

"Cathedrals of the New World" (North or South America). Price, 25c each.

A number of the publications deal with South American countries and capitals, Panama, Mexico, and the West Indies. Others deal with arctic and antarctic explorations; still others take the reader to strange places in Asia, Africa, or Australia.

Anyone interested in this price list (No. 35), which enumerates these "travelogues," may obtain a copy by sending a postal to the Superintendent of Documents, Washington, D. C. Do not write to the United States Department of Agriculture for this price list or publications listed.

PERFECTLY SAFE

Mrs. Capron saw old Uncle Timothy starting away on a fishing expedition and, knowing how hard his wife worked, thought it a good time to reprove him for his laziness.

"Timothy," she said, "do you think it's right to leave your wife at the washtub while you pass your time fishing?"

"Yassum, miss," replied the old colored man. "It's all right. Mah wife don' need any watching. She'll wuk jes' as hard as if I was dah."

Gas Stove Convenience with Kerosene

Cooks the Cooking Not the Cook

A good oil stove concentrates all its heat at the cooking point. That avoids an overheated kitchen and that means comfort for the cook even on hot, sweltering summer days.

New Perfection Oil Cook-Stove

For Best Results Use Pearl Oil

An oil stove brings the convenience of gas to homes without gas. No heavy fuel to carry. No dirt and ashes. And yet it cooks anything a big coal or wood stove does. It is clean, convenient, economical. No odor. Does not taint the food. Ask your dealer. See exhibit, Palace of Manufactures, Panama-Pacific Exposition.

HAY

Under date of July 24, Scott, Magner & Miller say:
Arrivals of hay for the week ending today amounted to 4800 tons. New crop has moved more freely during the past week into the market although the main part of our total receipts still consists of old crop hay which continues to come forward on purchases that were made several months ago. The quality of the present crop appears to be much better than last year's output. Exporting in large quantities still continues. One full shipload of 4000 tons has just finished loading and departed for Australia. The sending of large quantities into a foreign market and receiving therefor foreign money to be distributed in California, appears a most advantageous and desirable line of trade for everyone concerned. Prices have been well maintained during the week. The choicer offerings have sold readily, in some instances at figures a little above regular quotations. There appears to be an undercurrent of better feeling in the alfalfa market. The crop has not yielded as was anticipated on account of various conditions. There has been a continually growing demand for manufactured alfalfa products and the large quantities of hay absorbed through these sources diminishes the supply for market purposes.

We quote the average wholesale price of hay in carload lots on today's market as follows:

Citrus Fruit Market

LOS ANGELES, July 28, 1915.

Valencias are now finding the strongest market of the season. Not much fruit is going forward, but it is being sent as fast as the market will take it and in accordance with the period still left to dispose of the crop. Valencias have a full three months yet before they should be cleaned up, and there are about 2500 carloads left to go.

The lemon situation is somewhat more favorable than it has been, but there are many lemons on hand in this state waiting for favorable weather in the East before it will pay to ship them. 40 to 50 cars are going out daily. Mediterranean lemons are heavy competitors.

Shipments

Shipments of oranges from Southern California to date since November 1, 1915, 30,100 cars, lemons 5264, total 35,364. To same date last season, oranges 33,315, lemons 2403, total 35,718. From Tulare County, oranges 5648, lemons 202, total 5850. To same date last season, oranges 5875, lemons 30, total 5905. From northern counties this season, oranges 630, lemons 2. Last season, oranges 404, lemons 5.

NEW YORK TIMES, July 26.—Ten cars Valencias, two navels, one mixed car, and two cars lemons sold. Market higher on Valencias, unchanged on lemons. Partly cloudy.

A TORRENS TITLE

(Continued from Page 106)

your duplicate, "I hereby grant to—the property described herein. Witness my hand and seal." Sign it, acknowledge your signature before a notary, hand the certificate to the new owner, and he hands you the money. This transfers your interest in the land, just as when you indorse a check you transfer your interest in it. To get a title the buyer hands the old certificate to the registrar and gets a new one for which he pays one dollar. The owner of the land pays nothing. Or the buyer and seller may go together, look at the record where all claims are entered, give up the old certificate and get the new one. Every lien, attachment, assessment, etc., except taxes, that is good against the land is shown on that one page.

Mortgaging

A signed and acknowledged mortgage and the duplicate certificate are handed to the registrar. He compares the signatures on the mortgage and his receipt. If he is satisfied that you have the right to make the mortgage, he makes three entries, one on your certificate, one in his register and one on the original certificate that he has. He puts the mortgage in his file and collects 50 cents. To extend a mortgage the cost and process are similar. To release a mortgage, the entries are made in red ink; the cost is 25 cents.

Anyone buying the land buys it upon the word of the state that it is yours. A person lending money on your title lends money upon the state's word that the land is yours. The property can not be taken from under that claim until it is satisfied.

A Torrens title means absolute security for loans; certainty of ownership; cuts off recording, escrow, and certificate of title costs; avoids the expense for deeds; certificate never grows old; claims all recorded on one page that is easily found; deals can be closed in an hour at very small expense; no continuous expense for transfer; protection against fraud.

Without all the facts about a piece of property, it is not possible to tell exactly what a Torrens title will cost. A rough general estimate including every expense that will apply to almost any property is \$20 to \$50. Lack of space has compelled the omission of details, but questions addressed to the Cultivator will have prompt reply.

FUMIGATION SCHOOL PROGRAM

The school of fumigation referred to on page 101 of this issue will be held in the high school building at Pomona, August 9 to 13. Prof. C. W. Woodworth who is in charge of the school writes:

"Special features of the course include the experimental study of cyanid injury, both in the laboratory and orchard, beginning Monday afternoon and continuing under observation till the final discussion Friday morning. On three evenings after the lecture a trip will be made to a citrus orchard to study fumigation practice. On three mornings the exercises will begin with a lecture on scale insects and the afternoons with a lecture on fumigation chemicals. Very full study of tent material and leakage and of gas generation and properties will also be given prominence."

Monday, August 9, afternoon—Introductory lecture illustrated with lantern slides showing the early practice of fumigation; lecture and discussion on the theory of cyanid injury; laboratory experiments with oranges and foliage to determine the cause of injury. Evening—Lecture and experiments on methods of generation of cyanid gas; orchard experiments with excessive doses.

Tuesday, August 10, morning—Lecture—The hatching and distribution of young scale insects; lecture and experiments illustrating physical properties of cyanid gas. Afternoon—Lecture—The manufacture of sodium cyanid; lecture, the theory of leakage testing; practice in the use of the leakage tester, comparing various tent materials and the effects of moisture. Evening—Lecture—The marking and measurement of tents; orchard practice in measuring and the comparison of methods; comparison of machine and pot generation.

Wednesday, August 11, morning—Lecture—The nature of scale insect injury; lecture, the methods of tent calculation; practice in the calculation of tent volume, area, etc. Afternoon—Lecture—The manufacture of sulfuric acid; lecture, the history and comparison of dosage systems; lecture, the uniformity of machine generation; exhibition of the construction of a fumigation machine. Evening—Lecture—The construction of dosage tables; orchard practice in the use of dosage tables.

Thursday, August 12, morning—Lecture—The species of scale insects; lecture, the relation of weave to tightness and strength of tent material; practice in testing weave, tightness and strength of tent materials. Afternoon—Lecture—Physical and chemical qualities of cyanid and acid; lecture, the initial dose in machine fumigation; experimental demonstration of the physiological action of cyanid. Evening—Lecture—Absorption of cyanid by the soil, with experimental demonstration; round table discussion and social evening.

Friday, August 13, morning—Final discussion on fumigation injury with an exhibition of the results of experiments.

One of the biggest attractions of the zone is said to be the Panama Canal. By this wonderful reproduction of the waterway which connects the Atlantic and Pacific Oceans, covering five acres of ground, with the topography of the country accurately laid out in accordance with the original plans of the Panama Canal Zone, together with a panorama of the country and the two oceans, the spectator has brought to his vision over 5000 square miles of land and water, and it is an inspiring and interesting sight to see a ship travel apparently under its own power from the Pacific to the Atlantic Ocean, being lifted into the locks and sailing majestically through the water without a hitch or stop.

I. H. C. EXHIBITS

There are many wonderful things at both the Panama-Pacific and Panama-California Expositions. One of the most instructive and wonderful of all these is that of the International Harvester Company. At both expositions this company's exhibits are most astonishing because of their magnitude and beauty.

At San Francisco the display is in the Agricultural Building. At San Diego the company has constructed its own building at the rear of which is an orchard and large demonstration ground in which tractors, trucks and other power machines are given a thorough demonstration. The farmer has opportunity to learn much at either of these great exhibits.

The company has just issued a booklet of 63 pages, which gives a most excellent idea of its exhibits. We doubt not the visitor to these exhibits may have this booklet for the asking.

One of the most complete and best illustrated books on barn plans and equipment received at this office is from the Loudon Machinery Co. This book contains 112 pages with half-tone illustrations and plans of various size barns from a small combination barn for three horses and three cows to the larger dairy barn. Besides illustrations and plans of barns it contains much valuable information that every rancher ought to have. It will be mailed free to readers of the California Cultivator who write to Loudon Machinery Co., 510 Bruce St., Fairfield, Iowa.

**Get Your Crop in
on Time with a
"Creeping Grip" Tractor**

WHY let low, wet spots in your field set you back? Your time is limited—your crop must be started without delay if you want maximum yield when harvest time comes.

Here's the tractor that asks no favors of soft, wet ground. It can pull your plows through any ground that's worth working. The creepers do not sink or pack the soil—they cannot slip and lose power. They creep along over the ground, getting a firm grip and giving you maximum traction with the least weight on the soil, least consumption of fuel, and least wear and tear on the power plant.

The machine rides on steel rails on the endless track. The creepers oscillate over rough spots. Thus the power

plant is carried smoothly, free from jolts and vibration. The frame sets up on 3 points of suspension, which eliminates binding on the bearings.

No other power is as well suited for pulling your plows, harrows, seeders and combined harvesters. Let us tell you how you can cut your present cost of doing this work.

Write for Catalog

No other tractor is as carefully built as the "Creeping Grip." We put in it the best materials than can be produced. A demonstration will convince you. In writing please tell us how many acres you operate, so that we can suggest the best size suited for your work.

CASE
For Every Purpose

The CASE line of gas, oil and steam tractors is complete. Every tractor demand is successfully met. From the new 10-20 gas tractor, just out, to the mighty 110 h. p. CASE steam tractor, you will find nothing to equal them in durability, simplicity and low cost of operation and upkeep.

For 72 years and more the name of CASE has stood for mechanical perfection in motive power machinery. CASE Tractors have carried the famous Eagle Trademark to every corner of the globe. And today they are farther in the lead than ever.

Gas—Oil—Steam

CASE Tractors are adapted to burn every type of fuel. Our Gas Tractors as well as our Gas and Oil types hold records for fuel economy and working efficiency. CASE Steam Tractors have pointed the way since tractors were first known.

Case 40 H. P. Gas and Oil Tractor

The world's champion oil or gas tractor. It has never been surpassed for general utility. Years ahead of any competing type. Uses any petroleum fuel. Also made in 60 h. p. size.

Write for Facts

CASE Tractors and SATTLE Tractor Gang Plows solve every power-plowing problem. Our handsome new book tells all about our Tractors, Plows, Steel Threshing Machines, Automobiles, Corn Shellers, Hay Balers and Road Machinery. A postcard brings you a free copy, together with our latest booklet of evidences, "Facts from the Field."

One Dollar Yearly

Fruit Growers Convention

Pears, Potatoes and Pessimism Leading Factors at 46th State Convention Gathering in Leland Stanford, Jr., University. Largest Ever in Attendance of Great Men in Agricultural Science and Research and Smallest Ever in Attendance of Fruit Growers

THE forty-sixth State Fruit Growers' Convention is ended. David Starr Jordan gave hearty welcome and said "All of Leland Stanford, Jr. University is yours; accept it, but don't take it away."

It has been a convention of the expert, the specialist, the scientist. It has not been a convention of the farmer nor the orchardist. For some reason he did not understand the feast in store here, or else the big crop of fruit kept him at home, or else the price of fruit, which is not "big," was a determining factor. Whatever the reason, there was never such a program offered to so few hearers.

In the discussion of the outlook for various fruits Mr. Swett remarked that as the addresses had been a symposium of pessimism he would join in to show wherein the grape industry was in line with other fruits.

Mr. Neff's review of the walnut situation, given in last week's Cultivator, was perhaps the most optimistic of any, though each review found a ray of hope—providing Europe would adopt the safety first slogan, providing growers would produce finer fruit more cheaply, providing marketing conditions would improve so that the producers would receive rather more than one-fourth of the consumer's dollar, providing also that many other conditions would change.

But it wasn't as discouraging as the above sounds, for it wasn't so much a discouraged note as a must-do-different note. We must understand our soils better; we must handle them so as to produce maximum returns; we must use more fertilizers. California uses only about 50,000 tons of commercial fertilizer. Dr. Lipman of New Jersey told us his little state uses over 200,000 tons. Instead of producing 30 or 40 sacks of spuds on an acre we must use California soil, California water, its climate, its fertilizer, and more, the highest intelligence of its producers, till we produce 100—200—yes, 300 sacks per acre.

"But why produce more? Our prices are nil for what we produce now. We are ruined by our production of a quantity which our markets won't take." And so the marketing question would come up. In season, out of season, "teach us to cooperate or do something to save ourselves."

Mr. Johnson of the Farmers' Union spoke most sensibly of the failure of so many farmers to grasp the true meaning of co-operation and of the danger of becoming discouraged too quickly when success does not come as expected. Cooperation is a matter of slow education. It must come, it is coming, it even has come—and successfully—in many cases. It will be more general. But a general consideration of the topic was deferred till the next convention, which will be at Visalia, Tulare County.

In announcing the next meeting Commissioner Cook said that the two topics to be given greatest prominence at the next meeting would be cooperative marketing and the use of the tractor in orcharding and farming.

I trust our readers will consider how impossible it is to attend such a convention, beginning Monday morning and lasting till Saturday night, much of the time two meetings in session at one time, and write any report which will give a correct idea of the entire convention—much less of all the lessons brought out. I may at best give only hints of the lessons. As Mrs. Hoppin would express it, the greatest feature of such a convention is "the being with those who think great thoughts and do great things."

One lesson: Prof. Reimers of the Oregon station talked of the sulphur fertilizer theory. He and his station force have been experimenting with the use of sulphur as a fertilizer. Applied to alfalfa (which showed 40 to 50 per cent increase) and some other crops, the proof of its value is conclusive. The value of superphosphate has been shown to come largely from the sulphur content of the sulphuric acid used in making available the phosphorus of the rock or bone. I cannot enlarge upon this, but our readers will later be given more (it has already been touched upon in our columns) in a later number. Meantime keep your eyes open for other new things.

Prof. I. P. Roberts' lesson to the convention! "We must have reserve power. The farmer needs a reserve as much as does the banker. If he doesn't have the reserve he is on dangerous ground."

Chemist E. M. Chase of the United States Department of Agriculture: "Usually better oranges are produced on the hillside or higher land—but an orchard on low valley land which is given good care will produce far better fruit than a similar orchard poorly cared for on higher, more favorably situated land."

The resolution committee reported:

Resolutions

The forty-sixth State Fruit Growers' Convention of California, held at Stanford University, in surroundings of singular attractiveness and convenience, hereby adopts the following resolutions:

That we acknowledge with strong appreciation the liberal and active kindness of Dr. Jordan and his associate officers who have extended to us the privileges of their remarkable location and great equipment, so largely and with such an offering of spacious ease and beauty that to have met here is in itself an experience to be remembered.

That our thanks are due to the Chamber of Commerce of Palo Alto for their hospitality and the entertainment of our members, to whom the city and its delightful surroundings have been thrown open as to welcome visitors.

That to the committee of arrangements and all who have joined to secure the program of our meetings and their successful conduct we offer also our hearty acknowledgements.

That the attendance of horticultural advisers from sister states, who have come in a spirit of free helpfulness to contribute to our enlightenment from the results of their earnest investigations and well-considered experience, is appreciated by us as a

San Dimas, Cal.

service of singular quality; and that we recognize also our obligation to our state university authorities, to the county commissioners who have taken part in our meetings and also to the several fruit growers who have offered for our consideration their views and the records of their activities. From all these sources we have drawn material which should help in our horticultural progress through the coming year.

That we have reached a period where we may reflect with satisfaction and with a strong confidence on the alliance which has already been formed between the working fruit growers of California and the well-trained scientific students who are always at hand to help them through their difficulties. Through this connection we have built up a faith that nothing can permanently stop our forward movement. Our university, our horticultural commission, the far-extended arm of the department of agriculture, are agencies on which we rely continually and with appreciation, and scattered over all our territory are private investigators quietly making their own experiments and holding the results at the service of all who choose to profit by them. We have arranged that a liberal intelligence shall always be an intimate partner in our industry and in that arrangement we have provided the best possible insurance.

The rapid development of cooperative marketing of orchard products has passed the need of argument in its support. We all know that it is only by these methods, steadily and intelligently applied, that there can be any large and continued success in any of our industries. We recommend therefore that whatever branches of fruit growing are behindhand in the formation of strong and workable associations make vigorous efforts to secure themselves and to prove a capacity for accommodation and restraint as well as persistent purpose. As our various organizations become more thoroughly established, we may look forward to some form of union that may include all sections of the industry and may by its combined strength be able to attack problems too large for minor effort.

As a matter of some moment, especially as regards the enterprise of newcomers to the state, we note the desirability of an attempt to confine large plantings to varieties well proven in the way of commercial success. Much loss is occasioned by a willingness to plant trees on recommendations whose authority has not been scrutinized.—E. S. Thacher, D. D. Sharp, K. S. Knowlton, A. L. Wisker, T. O. Morrison, John Vallance.

One resolution which failed of endorsement by the committee was presented by Edward Berwick. It was:

Whereas war both kills off our customers and necessarily results ultimately in decreased commerce; be it

Resolved that this convention expresses hereby its hope that President Wilson will continue his pacific policy so nobly begun and refuse to be drawn into war by jingoistic journalists, panic-mongers, scare-breeders, armament syndicates or any others, who for personal profit are striving to embroil the United States in the bloody conflict that is turning Europe into a slaughter pen.

Members refused to be classed with jingoistic panic mongers or under any term which might be construed as favoring a peace-at-any-price policy.

Potato Growers' Resolution

The potato growers are seriously

concerned at the many problems which are before them. These problems are shown by their resolutions:

Resolved, that the damage to the potato industry by tuber moth has been overestimated, and that, while we consider it a pest which should not be carelessly introduced into new localities, yet the damage from introduction after careful inspection of potatoes is slight and its injury if introduced into northern states is problematical.

Second, that a committee be appointed to collect and prepare disseminating information regarding injury caused by tuber moth and danger of its spread and the injury which is likely to result by its introduction into other sections of the state.

Third, that the convention request that the state commission of horticulture order the inspection for tuber moth and eelworm of all potatoes designed for shipment to other states from San Joaquin, Sacramento, Contra Costa, Alameda, Monterey, Los Angeles and other counties he may deem wise to include.

Fourth, that the convention favors the inspection for tuber moth and eelworm of potatoes intended for seed purposes.

Fifth, that the convention strongly endorses the movement for better seed potatoes and heartily approves the system inaugurated by the California certified seed bill.

Sixth, whereas, there is great necessity for establishing and maintaining experimental work to determine where and how good seed potatoes can be produced, the relative value of such seed, and also the best practices to be followed in seed selection, fertilization, cultural methods, irrigation, crop rotations, in overcoming potato diseases and insect pests.

Therefore, we resolve that concerted effort be made to raise sufficient funds to establish and maintain this work, and that a committee be appointed by the president to secure the financial aid necessary for this work.

The pear growers did not "resolve," but with blight destroying the bearing trees of the state with fearful rapidity it is realized that "something must be done." That something is being done in some orchards—or one at least as was shown by the report of Percy Gammon who is managing his father's large property at Sacramento.—In his orchard great profit was secured by thorough cutting with disinfected tools at a cost of 30 cents per tree per year.

Dr. Cook, Deputy Weldon, Secretary Vosler, together with university people and orchardists of this state and other states worked hard to produce the program. It was an excellent one, and while few were present to be inspired by it, through the Cultivator and other papers much of the good material will be passed on.

One pleasure of the convention can not be passed. That pleasure was given to us by Prof. R. M. Alden in his organ recitals in the wonderfully beautiful memorial chapel. This structure cost not far from \$1,200,000 and was almost wholly destroyed by the '06 earthquake. Its restoration, which is not yet completed, has already cost over \$800,000 and its walls of mosaic and its art windows are all sermons. Each afternoon at 5 o'clock in honor of the convention Prof. Alden presided at the organ.—C. B. M.

BLIGHT RESISTANT ROOTS

By A. L. Wisker

California's experience with pear blight, *Bacillus amylovorus*, during the past two years has again emphasized the relative inability of orchardists generally to control this most serious of all diseases to which the pear is subject, and once more compels attention to the imperative need of adopting every measure that tends toward its suppression.

When a single grower suffers a loss of \$25,000 from blight in one season argument is unnecessary to show that the situation is serious, particularly in view of the fact that California's pear industry, according to the last census, produced more money than that of any other state in the Union, notwithstanding the fact that her nearest rival, New York, had 50 per cent more bearing trees and in total number had just twice as many as California. Michigan is close behind this state in number of bearing trees and in total number, but the value of her crop was less than one-third the value of ours.

State	Bearing trees	Total No.	Bushels—1910	Value
California	1,410,905	1,808,998	1,928,097	\$1,660,963
New York	2,141,596	3,644,251	1,343,089	1,418,218
Michigan	1,136,151	1,760,082	666,023	535,771

The statistics of the industry for the three states are as follows:

Collectively these states produce nearly half the pears of the entire nation.

Assuredly these figures warrant the assertion that if it pays to fight pear-blight in any part of the country it will pay doubly well to do so here where the industry is more profitable than in either of the other states where production approaches that of California.

The absolute eradication of pear blight cannot be hoped for, but blight control is a reasonable and practical expectation. Splendid work is now being done by scientific and practical investigators in the study of both preventive and remedial measures. The first named appear to be of greatest promise, and much research work is in progress to discover and to breed varieties of high quality which shall be strongly blight resistant in root, in trunk and in branch. It is along this line that eventual deliverance from blight will be found, but some years must elapse before horticulture can reap the benefit of the work now in hand. In the meantime blight problems will continue to arise, and it is the purpose of this paper to particularly deal with our present knowledge of blight-resistant roots, since the elimination of blight in the underground parts of trees must ever remain the first and most important step toward pear blight control.

Probably 80 per cent of all pear trees grown in the United States are either budded or grafted on seedlings of *pyrus communis*, the wild pear of Europe, commonly called by nurserymen the French pear. This is the ideal root for the nurseryman since it has perfect affinity for all the commercial varieties, is satisfactory to "work," and if propagation is done by budding a high percentage of buds "take" if the work is properly done.

However, from the standpoint of the orchardist it has three serious faults, it root-suckers profusely from plow injuries, is subject to great injury from the root aphid, and is particularly susceptible to the bacteria of pear blight, more so, in fact, than any other root used in pear propagation. For these reasons securing a satisfactory substitute becomes a matter of great importance.

It is known that the pear can be grown on seedlings of the hawthorn and the mountain ash, yet very few have been thus propagated and little is known of the behavior of trees thus produced. However, Dr. Bailey states that good dwarfs can be grown on the thorn and that there is reason to believe that some of the thorns will be preferable to quince stocks for dwarf pears in severe climates, while the mountain ash has been used where the soil is excessively sandy and is believed to be fairly resistant to blight.

The pear may also be grown on apple roots. In such cases the root is somewhat blight resistant but the tree is short-lived and apparently no advantage is to be found in this direction. No satisfactory pear orchards have been produced on the apple, although top-worked trees sometimes bear well for a few years. At Colfax, in this state, such a tree has borne extra fine fruit for the past five years and is still thrifty.

The affinity of some varieties of pears for the quince is well known,

and orchards of the dwarf trees thus produced are of commercial importance in some parts of the country. In the production of such trees the pear is budded on rooted quince cuttings. This root is considerably more blight-resistant than the French pear and is probably the best root to use in rich soil that is excessively moist. While dwarf pears are not in general favor in California, it is quite probable that under certain conditions they are much to be preferred to standard trees. Stephen Harmeling, a successful grower of Washington, maintains that under suitable conditions they are more profitable, and it is conceded that they are infinitely easier to inspect and prune if an outbreak of blight occurs in the orchard. Many varieties must be double worked when grown on quince, thus increasing cost of trees, but the fact that dwarf pears bear young and yield heavily, with an improvement in quality and shape for

certain varieties, together with a measurable degree of blight resistance, entitles the quince root to more consideration than it has yet received in California.

Rooted cuttings of the European-Asiatic hybrid pears, such as Kieffer, LeConte, Garber and Smith have been used to a limited extent but results have been generally negative. Kieffer is most promising of those named. LeConte cuttings were advocated several years since by a few California horticulturists. Of LeConte Prof. Waite says, "It was used in general commercial propagation in the southeastern states. It has not, however, proved particularly suitable. Bartlett orchards * * * on these rooted cuttings have gone down with the blight very seriously in Virginia and Maryland." Personally I have little confidence in rooted cuttings of these hybrids, but think there is a most hopeful field for experiment in testing rooted cuttings of certain varieties of European blood that have shown practically complete immunity to blight.

We have now to consider the root that in the present state of our knowledge appears to present the greatest combination of advantages of any of the roots having blight-resistant qualities, the Japan pear, *pyrus sinensis*, the wild pear of Asia. Some nurserymen untruthfully refer to this root as "blight proof;" it is not, but it is strongly blight resistant. There is no blight proof root thus far known to horticulture.

The use of this root extends over a relatively short period, and it is a matter of regret that we have no authoritative literature bearing upon the subject in a broad way, and no knowledge of any scientific observations extending over a period sufficient to warrant our arriving at wholly definite conclusions. Because no such analytical study of the subject is available I have been compelled to weigh the opinions of numerous observers, both scientific and practical, and to interpret them in the light of my own personal experience, which in itself is too limited to allow me to reach positive convictions. On most points the views of the various scientific observers harmonize and

Both of Chino's canneries are at work on peaches.

the following seem to be generally accepted as facts:

The Japan seedling is of vigorous habit, frequently making more thrifty growth than the French. (Prof. Waite believes the Asiatic pear and its hybrids make better growth in the East than on the Pacific Coast.)

Japan seedlings in the nursery are much less subject to fungus leaf-blight (*Entomosporium maculatum*) than French. Watson, the great seedling nurseryman, states that French seedlings will sometimes be completely defoliated by this disease when adjacent rows of Japan show no sign of infection and suffer no impairment of vigor.

Japan roots have but little tendency to sucker. French roots sucker readily from plow injury, and blight infection of such suckers speedily reaches the main roots of the tree.

The pear root aphid, the most serious insect enemy of the tree when grown on French roots, does comparatively little injury to the Japan root.

While Japan seedlings vary in their resistance to blight, as do the French, and show different degrees of resistance in different parts of the country, their average resistance is much greater than any other root now in use.

The Japan root will make satisfactory growth with less soil moisture than the French. It should, therefore, prove particularly valuable in all irrigated districts, especially throughout the foothill section, and in all dry soils. Important districts in Nevada and Placer Counties that have to pay high water rates, and certain districts that have no irrigation facilities, should adopt this root exclusively, since it not only is adapted to their dryer soils but is strongly resistant to their worst insect pest, the root louse, which in some localities is more to be feared than blight. This root is better adapted to dry, warm climates than the French, but its behavior in extremely severe northern climates is yet to be learned.

It will take several years of experimental work to conclusively determine these points. In our nursery at Grass Valley we have only worked Anjou, Bartlett, Comice and Forelle on Japan stocks, but our stand was satisfactory when the work was carefully done. In our work with the varieties mentioned it seems that Anjou has not "taken" quite as readily as the others, but that may be due to some other cause not determined.

Where the bud "takes" at all we find the union to be perfect and in every sense satisfactory. However, a Newcastle nursery is said to have had difficulty in getting a satisfactory union, but that is a point upon which all nurserymen who replied to the question claim to have had no difficulty. Mr. Barnicott of Newcastle strongly endorses the Japan root after several years use in his nursery work, but California nurserymen generally have grown relatively few Japan-root trees. Oregon nurserymen use Japan roots very largely, and this stock is also in favor in Washington.

The Japan root probably has one serious disadvantage; under conditions of excessive soil saturation it may be injured by root rot. If pear orchards on blight resistant roots are desired in such soils it may be best to grow dwarf pears on quince roots. Notwithstanding this one disadvantage of Japan, and the fact that it may be a little more expensive to the nurseryman to propagate trees on this root, we have discarded the French root entirely in our nursery. We be-

lieve the French root must go because of its many evil qualities. If more complete acquaintance with the Japan root should prove that it has serious faults, the next step in the direction of blight resistant roots will be the propagation of trees on rooted cuttings of certain varieties of *pyrus communis* blood that have shown wonderful immunity to blight. It will probably take ten years of experiment to bring about this substitution. But the orchardist of the present may feel positive assurance that the day of blight resistant roots is now at hand and may at least safeguard his orchard to this extent.

Grateful acknowledgement is made to Dr. Taylor, Prof. Waite, Prof. Gould, Prof. Lewis, Prof. O'Gara, Prof. Hedrick and Prof. Reimer, all of whom have generously given information that has been of material assistance in the preparation of this paper.

* * *

THE OUTLOOK FOR THE LEMON

By G. W. Hosford, Manager San Dimas Lemon Association

According to the data assembled by the Citrus Protective League, the total acreage of lemon trees in California is about 32,000. Of this acreage over one-half is not in bearing, and assum-

Some of the Old Guard who have attended Conventions for 20 or more years. From left to right: Messrs. Hecke, Walton, Boalt, Nordyke, Ehrhorn, Stabler, Cutter

ing that the old groves should continue their present production and that the young groves produce as heavily, we shall be producing within eight or ten years more lemons than are at present consumed in this country. In the past few years California has produced about one-half the total amount used in the United States. The balance has been imported from Italy and mostly from the Island of Sicily.

Under the reduced tariff presented to us by the present administration we have found the competition with Sicilian lemons very hard to meet in the Eastern markets. This country has been considered by the Italians their best lemon market, it having used on an average about 25 per cent of the entire Italian production. Under the cheap labor conditions of Italy and the smaller transportation charges to the Atlantic seaboard the Italians can pay the present tariff and still grow lemons at a profit when the California grower is producing at a loss.

It will be seen, therefore, that the elimination of the imported lemon and replacing it with the California article, can be accomplished only by a stiff fight. There is no doubt that this condition must be met during the next few years and overcome in order to market the increased crop which the large amount of young acreage promises.

The California lemon growers are alive to the situation and have already taken steps to meet the conditions which are confronting them. A large proportion of the lemons are handled through the selling facilities of the California Fruit Growers' Exchange. Practically all of the large shippers of

lemons have availed themselves of the superior facilities for marketing fruit through this organization. The exchange has been working for several years on an extensive advertising campaign for both oranges and lemons. During the coming year for the first time, a national campaign will be inaugurated to increase the sale and use of lemons. The results already obtained in the advertising of Sunkist brands have been very satisfactory. The growers have every reason to feel confident that the advertising of Sunkist lemons will help very materially in the handling of the increased output.

Quality

With the lemon as with every other fruit the reputation for superior quality is a great asset in its marketing. During the past ten years the California lemon has been making steady progress in the markets of the country until it has secured an enviable reputation, not only for honest, uniform pack but also for keeping quality. In the Western markets where the better grades of California lemons have been largely marketed up to this time, this is universally true. In the Eastern auction markets where the poorer grades of California lemons have been marketed in competition with the imported lemons, progress has been slower. Nevertheless in the New York market, the home of the imported lemon, California lemons have consistently averaged higher during the past two years than the foreign lemon.

One of the big problems before the California lemon grower is that of producing and handling a lemon of superior quality on an average to that which has as yet been marketed. These problems are all receiving close attention by the state experiment station, and the growers are very quick to avail themselves of all information which may be obtained through this or other means. Investigations carried on through several years by the United States department of agriculture in the handling of lemons have pointed out to the growers that a great many difficulties may be overcome by careful handling. There are few fruits which are more easily injured or in which decay follows so inevitably the mechanical injury to the skin as in the lemon.

By-Products

Until the present time there has been no satisfactory by-product industry in the lemon business of California. Several factories have been started by private capital that have been more or less unstable. The growers have this year organized a cooperative undertaking for the purpose of utilizing lemon culls in the manufacture of by-products, particularly citric acid and lemon oil. These two products are staples which have a merchandizing value and a world market. New methods of manufacturing have been devised which make it possible to replace with machinery the cheap hand labor of Italy, and which give promise of making a profitable business. Where successful the benefits which may be derived through this move will be two-fold: First, in utilizing a waste product and bringing a small net return where there was previously none, and second in utilizing the low grade, the poor keeping fruit, and thus materially strengthening the reputation of the fruit which is shipped. The United States market for citric acid and lemon oil alone would utilize a considerable portion

of the fresh lemons produced in California.

Improved Varieties

The work of Mr. A. D. Shamel of the United States department of agriculture has called the attention of the lemon growers, as well as the orange growers, to the fact that the present varieties of citrus fruit may be greatly improved, both in quality and quantity of production through the selection of individual trees possessing these superior attributes. In the same groves trees are found which produce about one-fifth of the quantity of fruit of a very inferior quality, alongside of trees, which have been propagated under the same variety names, which produce five times as much fruit of a very superior quality. Already there is a ready market for trees propagated from trees having authentic records of high productivity. Some very careful work has been done along this line, both by the growers and by nurserymen, to secure accurate records of the production of all the trees of some groves. There is already considerable interest at the present time in the budding over of some of the unprofitable trees with buds from these trees of proven merit. While the improvement of the quality of the fruit shipped from California, through this means, will be gradual, it cannot help but produce a very permanent improvement in the quality and in the reputation of the output of the state.

Conclusion

With increased quality and production through better methods of culture and through the selection of improved strains of our present varieties; with the utilization of the waste culls for by-product purposes and the consequent improvement in the quality of the fruit which is shipped; with improved methods of handling and preparing for market, and with the wider advertising, the cumulative results in the advertising already done by the California Fruit Growers' Exchange, the progressive lemon grower of California feels that he can meet the competition with foreign fruit and still produce lemons at a profit in the years to come.

THE FUTURE OF THE ALMOND IN CALIFORNIA

By George W. Pierce, President California Almond Growers' Exchange

Accepting as an established fact the ability of California to actually produce almonds, the future of the industry in the state depends upon the ability of the orchardist to market the product at a sufficiently remunerative price. If the crop cannot be sold at a reasonable profit its decline is certain. There is little satisfaction, save to the "gentleman farmer," in knowing that one can produce any given crop unless he is assured that he can dispose of it at a price that will leave him a fair profit.

Vexing as are many of the problems that present themselves to the grower, the greatest of these is the marketing of the output. The extension of almond growing in California rests rather on a commercial than on a horticultural basis.

The market for California almonds up to the present time has been confined to the demand from the United States. The annual consumption in America amounts to about 6000 tons in the shell and about 5000 tons of shelled goods, or expressing the shelled in terms of the unshelled, we find the consumption to be annually about 16,000 tons.

There are two sources of supply to meet America's demand for almonds. These are California and Southern Europe. The two are in direct competition. Each is seeking the American trade. There is but one market, and it goes without saying that the section that can acceptably supply that market at the lowest cost to the

consumer will ultimately get the trade.

Heretofore the imported product has enjoyed the bulk of the trade in shelled almonds. There is a market the year round from the baker and the confectioner for the shelled goods. For the nuts in the shell there is a limited market, limited as to the amount consumed and limited as to the time of demand. Almonds in the shell find their readiest market at and immediately before the holidays. Many of the wholesale dealers in almonds in the shell are practically out of the market by the first of February.

Eighty per cent of the imported almonds are shelled, while but five per cent of the California crop are shelled. It will thus be seen that under existing conditions the California almond industry is sadly handicapped. On certain years difficulty has been experi-

Mrs. Myrtle Shepherd Francis and Miss Vida French. Mr. John P. Coy, Commissioner of San Bernardino County, and Prof. G. P. Gray, Chemist of State University. The center figure is Commissioner Earl Morris of Santa Clara County, and at his left is Mr. L. R. Bodefield of Colusa.

enced in disposing of small crops at prices that were remunerative to the grower. If this be true with our present output, what may we expect within the next five years when the crop will probably be in the neighborhood of 15,000 tons? What will happen when California produces an amount equal to the present total consumption of both imported and domestic almonds?

Are imports from Europe at a standstill? Not by any means. In 1900, 5,140,232 pounds were exported to America. In 1914, 4,753,525 pounds of unshelled, and 10,114,901 pounds of shelled goods came here. In 1914 the importations were 10,000 greater than they were in 1900.

Save perhaps in one single variety alone, the Jordan almond, chiefly an imported product, there is not difference enough as to quality between the imported and the home product to demand serious attention. The almond stands transportation well and is not perishable. Having disposed annually of an output several times as large as we produce, the handlers of the imported product have a strong hold on the markets of America. While the demand equals or excels the supply, all almonds delivered will be absorbed by the trade at satisfactory prices. When production excels con-

sumption lower prices naturally prevail. If at any time one competitor places his output on the market at a price prohibitive to the other, there are but two courses open to the less favored grower; these are bankruptcy or a voluntary retirement from the business.

In the final statement of the cost of production of almonds will be found the following items: Taxes, interest on investment, supplies, labor and marketing. Chief of these is labor. When one compares the wages paid in California with those paid in Spain, France and Italy, he finds that the European grower has a most decided advantage. The labor put into a pound of almonds in Spain is only about one-third as much as the California producer is compelled to put into a pound of his product. In the matter of interest and supplies the Spanish grower again has the lesser expense.

When one considers transportation rates he finds that it costs the American almond grower more to deliver almonds to the home market than it

does the Spanish grower to ship across the ocean to the same market. The overland freight rate from California to chief eastern points is \$1.40 per hundred weight. By steamer from San Francisco to New York, via Panama, it is 75 cents per hundred weight. From Malaga, Spain, to New York it is about 27 cents per hundred weight.

The federal government long ago recognized the disadvantages under which the California almond grower labors. For a considerable time a handicap on the European grower in the form of an import duty equal to six cents per pound on the shelled and four cents per pound on the unshelled goods was levied on all imports. This it was thought would equalize the cost of production and delivery to the common American markets. It meant in the judgment of those responsible for the law that it costs about five per cent per pound more to produce a pound of almonds in America than it does in Southern Europe. Recent legislation has re-

(Continued on Page 143)

REBUILD YOUR SOIL

In either grove or orchard, by planting a cover crop such as clover or vetch and inoculating the soil with FARMOGERM (high-bred nitrogen-gathering bacteria).

Nitrogen and Humus, two essential elements, mean big and increased crops.

Inoculate your cover crop with FARMOGERM and be assured of both these essential elements.

The experiment stations of sixteen different states report an average of 122 lbs. of nitrogen per acre from well-inoculated fields.

The Standard Inoculation

FARMOGERM

High-Bred Nitrogen Gathering Bacteria.

is a moist, jelly-like substance, containing billions of nitrogen-gathering bacteria. It is put up in a patent bottle which keeps the jelly (containing bacteria food) moist at all times.

Bacteria cannot live long in cotton wads, granular media, or in any other dry state. The nitrogen-gathering bacteria live for years in the moist jelly-like media of FARMOGERM.

Results Guaranteed

Prices: 1 Acre, \$2.00; 5 Acres, \$6.00; 50 Acres, \$55.00.

Our inoculation experts will gladly give detailed information regarding inoculation with FARMOGERM.

Farm Bureaus

THE farm bureau movement in California is growing. In two of the counties the work has been so pressing that the advisers have found it necessary to have assistants. Adviser Frank F. Lyons of San Joaquin County has been given an assistant in Mr. C. J. Williams. He writes this week especially of the work among the boys' clubs in his county. Mr. G. H. Wilson has been named as assistant to Adviser H. A. Weinland of San Diego County.

Stanislaus County is the newest in the state with an organized farm bureau and a county adviser. George M. Connor is the new adviser. He held a conference with the directors of the county farm bureau at Modesto July 29, at which meeting B. H. Cocherson, state leader for California, was present. Mr. Connor was for six years assistant director and acting director of agriculture in the Philippine Islands. He was before that professor of agriculture in North and South Carolina and in Florida. He now has a citrus ranch in Tulare County.

Farm Advisers' Conference

The farm advisers of the counties in the state which have farm bureau organizations—there are now 11—will meet in conference at Berkeley the week of August 9. Their sessions will be held in connection with the American Association of Agricultural Colleges and experiment stations, and American Farm Management Association. Prof. B. H. Cocherson writes: "These societies will be addressed by the foremost American authorities in agriculture, and these meetings are of such importance that all the farm advisers in the state, assistant farm advisers and workers in boys' clubs will be present."

"In the week beginning August 16 there will be held at Berkeley the National Congress of Boys and Girls' Clubs in connection with the meeting of the National Educational Association. This National Congress of Boys and Girls will be attended by the national all-star club winners in the young people's club work of the United States, many state leaders bringing their prize-winning boys with them. This state will be represented by 20 boys who went on last year's transcontinental tour as the prize winners of California, who will at this time hold their annual reunion. The sessions of the National Congress of Boys and Girls will take place at the college of agriculture at Berkeley and it will be open to all those interested in country work with boys and girls."

Ord Farm Center, August 2-3, night meeting August 3.

Bayliss Farm Center, August 5-6, night meeting August 6.

Codora Farm Center, August 9-10, night meeting August 10.

Larkin Farm Center, August 12-13, night meeting August 13.

Orland Farm Center, August 16-17, night meeting August 17.

Jacinto Farm Center, August 19-20, night meeting August 20.

The regular meeting of the board of directors of the county farm bureau will be held Saturday, August 7, at the office of the farm adviser.

Between dates of July 6 and 20, Dr. Cady of the bureau of animal industry, was engaged in educational work on hog cholera in the county. Dr. Cady gave demonstrations throughout the county at the various centers. His meetings were well attended and the farmers were greatly interested in the matter of preventive measures and in combating this disease. During Dr. Cady's stay in the county one outbreak of acute cholera occurred and serum treatment was applied to this herd of hogs. The work to the present writing has been entirely successful.

The Glenn County Farm Bureau is paying special attention to the organization of the hog and dairy industry of the county and is about ready to complete such organization. As preliminary to the associations which will be formed, the farm bureau is making complete census of the hogs and dairy stock throughout the various farm centers. The foundation for these associations will be well laid, and it is intended that the various advantages of cooperation and unity of interests shall be enjoyed by the farmers who join these associations.

The Glenn County farm bureau is the first in the state to control the various concessions generally needed at celebrations and picnics. These concessions are netting profits and helping out the farm bureau treasury. By this plan the farmer in a sense has twice the fun at half the price.

The Bayliss and Larkin farm centers are making a study in the marketing of farm products. Both these centers will hold special meetings during the month of August.

The farmers of the Orland farm center are considering the feasibility of constructing in cooperation with the United States reclamation service an electric transmission line from the East Park Reservoir to the rural district around Orland. Sufficient energy can be controlled, should this plan be carried out, to furnish power, light and heat for the town of Orland and the entire rural district surrounding.

Alameda County, C. W. Rubel, Adviser, Hayward

Hayward Center, Mt. Eden, Monday, August 2, 8 p. m.

Castro Valley Center, Castro Valley School, Friday, August 6, 8 p. m.

Newark Center, Newark Amusement Co. Pavilion, Monday, August 23, 8 p. m.

Niles Center, Chamber of Commerce, Niles, Wednesday, August 25, 8 p. m.

At the Hayward meeting at Mt. Eden there will be reports from the

special committees on weed eradication and on the employers' liability act in its relation to the farmer, also a talk on feeding of dairy cattle by the farm adviser.

Throughout the Irvington, Centerville and Niles sections a campaign for the more extended use of cover crops in the orchards is being inaugurated. Winter vetch is especially recommended.

Simi, Wednesday, August 25.

County Fair, August 26, 27 and 28.

Messrs. A. C. Hardison and H. H. Eastwood of the county highway commission, Charles Pettit, the county engineer, and Judge Elliott of Oxnard, have taken up at the farm bureau centers during the past month the discussion of the good roads situation, in relation to the proposed issuance of good roads bonds. The bond election, which has been called by the supervisors, is set for August 24. The Moorpark and Somis centers have appointed committees to secure rights-of-way which are needed for the proposed roads.

The farm adviser will have a desk at the agricultural exhibit of the county fair, August 26, 27 and 28. A demonstration of the use of anti-hog-cholera serum and virus, will be held at the Swine Breeders' Association exhibit, at 10 a. m., August 26, at the County Fair.

San Joaquin, Frank F. Lyons, Adviser, Stockton.

Linden, Wednesday, August 4, E. L. Davis, director.

Tracy, Monday, August 23, H. A. Frerichs, director.
Waterloo, Wednesday, August 25, R. G. Benjamin, director.
Stockton, Friday, August 27, W. N. Harrison, director.
Holt, Monday, August 30, R. G. Cole, director.

Besides the regular routine work of the farm advisory, there are three important subjects which are being carried through by Farm Adviser Frank F. Lyons and Assistant Farm Adviser Carl J. Williams of San Joaquin County. These are the high school boys' agricultural clubs, the South San Joaquin Community Fair, and a dairy survey of the South San Joaquin irrigation district.
The high school boys' agricultural club work is drawing to a very successful close. There are three very much alive clubs in the county. The Lodi club, which has a membership of 18, is growing potatoes; the Stockton club, with a membership of 11, is also growing potatoes. The Ripon club, with a membership of nine, which comprises all of the boys in the Ripon high school, has a fine crop of popcorn to show for their year's work.
The Lodi club is the pioneer club of San Joaquin County. It was organized last year and came through at the end of the season as one of the best clubs in the state. The boys grew tomatoes, which proved so successful that Raymond Beckman, who made a net profit of \$45.50 from one-tenth of an acre, was sent on the transcontinental tour by the people of Lodi as a reward for his good work. Strengthened by one year's experience and with a club consisting mostly of farmer boys, the Lodi club this year is going to show the people of the state just what it can do in the potato business. The judging of this year's crop and the selection of the prize winner has been set for the 2nd day of August.
The Stockton and Ripon clubs are both new this year, but are husky and wide awake, and the boy who will win in either club must be a worker.
The Ripon club, although smaller than the other two, is out for results. They are not only growing popcorn as a club crop, but are using their plots of corn as demonstration plots in the use of fertilizers and insecti-

cides for the benefit of the farmers of the community.
San Joaquin County is such a strong believer in the encouragement of its younger generation along agricultural lines that it is going to send all three of its boys' club prize winners east on the transcontinental tour, not only as reward to the boys and a demonstration of what they have accomplished, but also as an example of San Joaquin County's best produce and most valuable asset, the hard working and thinking young farmer.
San Diego, H. A. Weinland, Adviser, San Diego

The permanent organization meeting of the Winter Vegetable Union was held in the chamber of commerce, San Diego, Saturday, July 24. Mr. H. A. Weinland, county farm adviser, outlined the purposes and aims of the organization and Mr. G. H. Wilson, assistant farm adviser, gave the status of the organization to date, reporting 44 members signing 101 acres. In addition to this is a list of 88 prospective members, a number of whom will soon come in.
A permanent board of directors was elected. The members are: Mr. W. R. Edwards, Chula Vista; Mr. H. Culbertson, El Cajon; Mr. W. M. Sharpe, Otay; Mr. J. S. Hull, Nestor; Mr. E. L. Owens, La Mesa; Mr. I. C. Robinson, Spring Valley; Mr. J. S. Scott, El Cajon.
Maricopa County, Arizona, Jas. A. Armstrong, Adviser, Phoenix

Letters are being sent to agricultural organizations throughout the county asking that they send a councilman and one alternate to the next regular meeting at noon at the chamber of commerce, Phoenix, on Thursday September 16. This organization is composed of the regular members of all farmers' organizations in the county. All that is necessary to do to belong is to be a regular member of some recognized organization and to have that organization affiliate with the rest of the county by paying one dollar per year and having their councilman attend the monthly meetings held by the advisory council with the farm adviser. The real purpose of this organization is to consolidate agricultural interests and to study problems as they arise with the idea of disseminating the results of these conferences between the best men in each district, back through them to their local organization with the ultimate end of securing more profit to the producer.
Mr. M. E. Bemis, editor of the Stockman-Farmer, gave an address before the Gilbert Commercial and Country Club on Thursday night, July 22. He showed by an analysis of census figures that the pork production of Arizona was much lower than the average for the United States in spite of the fact that there was more cheap feed here than elsewhere. This means that we will have to raise more pork or ship it in.
Mr. M. C. Tucker, tester for the Cow Testing Association of Mesa, Chandler and Gilbert is a hustler. He has already increased the number of cows in the association from 600 to about 750, and others are coming in daily. He wants to increase this number to 1200.

Get Your Crop in on Time with a "Creeping Grip" Tractor

WHY let low, wet spots in your field set you back? Your time is limited—your crop must be started without delay if you want maximum yield when harvest time comes.

Here's the tractor that asks no favors of soft, wet ground. It can pull your plows through any ground that's worth working. The creepers do not sink or pack the soil—they cannot slip and lose power. They creep along over the ground, getting a firm grip and giving you maximum traction with the least weight on the soil, least consumption of fuel, and least wear and tear on the power plant.

The machine rides on steel rails on the endless track. The creepers oscillate over rough spots. Thus the power

plant is carried smoothly, free from jolts and vibration. The frame sets up on 3 points of suspension, which eliminates binding on the bearings.

No other power is as well suited for pulling your plows, harrows, seeders and combined harvesters. Let us tell you how you can cut your present cost of doing this work.

Write for Catalog

No other tractor is as carefully built as the "Creeping Grip." We put in it the best materials than can be produced. A demonstration will convince you. In writing please tell us how many acres you operate, so that we can suggest the best size suited for your work.

Telephone Economy

THE Kellogg farm telephone will save you money because: It is carefully made of the best material. It is easy to install and simple in construction. It does not get out of order easily, and is constructed for the heaviest farm line service. It is long lived. Thousands and thousands of Kellogg telephones are now in service over ten years. It is not affected by climatic conditions; has proper insulation of all parts, heavy nickeling of outside metal; iron and steel parts are copper plated and oxidized—they cannot rust, scale off and cause short circuits.

Kellogg Telephones

Every Kellogg telephone is equipped with our standard transmitter, over a million of one type in service today. Every transmitter will ring over the longest, heaviest loaded farm lines. This phone is equipped with a condenser, vastly improving the service of your lines. It can be equipped with a push button, enabling you to call central secretly and call other parties without disturbing your neighbors.

"Use is the test," judging solely by the service this telephone is giving today in all parts of the world. It will give you telephone transmission superior to anything on the market. It is the master telephone. Write today for our bulletins describing in plain language just how the Kellogg telephone will do these things for you. Write for Bulletin 24.

Small Fruits

Vegetables

THIS MONTH IN SOUTHERN CALIFORNIA

Written for the California Cultivator
By O. M. Morris

THE month of August might almost be termed our "second spring" as at this time all seeds may be sown for fall and winter. It is most important, however, that the ground be thoroughly irrigated and plowed before planting operations are undertaken.

Practically all varieties of seed usually planted in April may be planted this month. The commercial crop of potatoes should be planted soon to supply the winter market. If possible to secure old seed better results will be obtained than by planting new seed. Owing to the lateness of the season, however, the supply of old seed potatoes is pretty well exhausted, and in many instances it will be necessary to use spring grown stock. This should be well ripened. It is best to wait until the seed sprouts a little before planting. It is also necessary to cut the potatoes a few days before planting so as to dry the wound. Some growers allow these to lie directly in the sun but we think better results are obtained if they are slightly shaded.

Beans and all the early varieties of corn, beets, carrots, chard, kale kohlrabi, lettuce and onions should be planted in good quantities, also turnips and peas for early winter crop. In high, protected districts where tomatoes will succeed these may be planted for transplanting about the first of September; also peppers and egg plant, though these latter should not be planted very extensively at this season.

Cabbage and cauliflower may be planted for the next 60 days, the Winningstadt being the most popular shipping variety of cabbage while the Cannon Ball is by far the best producer. In the Montebello district the Cannon Ball yielded an average of 25 to 33 tons per acre the past season and was eagerly sought by shippers for the Eastern market, bringing from \$12.50 to \$19.00 per ton. The Cannon Ball should be planted much closer than the Winningstadt, thus ensuring heads of six to eight pounds, while if given too much space they grow too large for popular-sized heads. Fourteen to 16 inches is far enough apart to plant the Cannon Ball variety while on good soil with plenty of water 14 inches will give four to eight-pound heads. The Cannon Ball is the earliest cabbage grown, producing a six to eight-pound head two to three weeks earlier than the Winningstadt, which forms generally about a three-pound head, and as cabbage is generally sold wholesale by weight it is much the more profitable variety. The Cannon Ball heads probably a month to six weeks earlier than the Danish Ball Head but is similar in habit of growth and character of head.

Peas for holiday season, when best prices are obtainable, should be planted during August.

Most popular varieties of tomatoes for winter crop are Earliana and First Early, the latter producing more per-

fect fruit though not such a heavy bearer. Tomatoes should set a good crop before cold weather comes and will ripen through the early winter in districts where the temperature does not go too low.

MENDING BROKEN PLANTS

In the small family garden, every healthy, well started plant is of considerable importance, and if, as is frequently the case, one breaks or a cutworm clips it off, it leaves a noticeable gap. Tomatoes, Lima beans, string beans, peppers, cabbage, and cauliflower are usually the sufferers.

The plant thus apparently injured beyond recovery may be one of the few started from a very early planting, or it may be of a cherished variety; always its loss is regrettable.

It is not generally known that at the cost of a little effort such plants can be mended so that they will grow as vigorously as ever. Of course the common method is to make good such a loss by replanting but that entails a loss of time. If the plant be properly mended, there is practically no interruption of its normal development.

The mending, in order to be effective, must be done very soon after the injury appears; it is a case moreover of final as well as first aid, so the work must be done carefully. If the severed part of the plant is wilted it is generally too late to save it.

The closer the injury is to the ground, the easier it is to repair; in fact this kind of mending is virtually limited to wounds that are not over three or four inches above the surface of the soil.

Plants injured by cutworms, which always work their destruction at night, can be effectively mended if they are treated in the very early morning before the sun touches them. In all cases it is necessary that the injury be treated as soon as it is discovered.

The method is simple. From the stump of the plant pull back the soil to the depth of an inch or more, and if a cutworm has done the work, find and kill it; then, taking the severed top, fit the broken base carefully to the stump. Sometimes the break is smooth, sometimes jagged; nearly always you can find guides for the accurate adjustment and fitting of the adjacent parts. When you have done that, pulverize the soil with the hand, and put it back evenly and firmly.

Continue to pile up the earth until the mound is one or two inches above the break on the stem. The soil for packing should be damp and well broken up.

If the weather is cloudy no further precautions will be necessary, but in bright weather provide a shade such as an inverted crate affords. If the season is very dry, give the plant a little water a day or two after mending, but take care that you do not wash away the mound of packed earth from the mended parts.

By this method injured plants of naturally quick growth can, in nearly every instance, be made whole again. The capillary system by which the sap ascends is re-established, and nature is quick to do the rest. In the course of a few days the maimed plant will again be growing as vigorously as its uninjured fellows.—Youth's Companion.

The Lawn and

Flower Garden

THIS MONTH IN SOUTHERN CALIFORNIA

Written for the California Cultivator
By O. M. Morris

HARDY perennials of all sorts should be sown this month. Many will bloom yet this fall; others during the early spring and summer. This class of plants is most successfully grown in beds, later transplanting to permanent quarters for continued growth and blooming. Plant also seeds of the winter flowering plants, such as calceolaria, cineraria, primula, etc. While these are considered somewhat tender they will succeed under shade of trees or in similar shady positions and will bloom through the winter months. Pansies, centaureas, winter flowering sweet peas and like flowers should be planted for early winter when flowers are scarce and difficult to obtain. Care should be taken in planting pansies to cover closely with burlap or other material and give an abundance of water, otherwise they will burn out. We have obtained best results by enclosing the bed with one-foot boards, drawing a burlap covering tightly over the top. This protection helps to retain the moisture in the bed and affords plenty of shade for the young plants.

Seed of Christmas flowering sweet peas promises to be extremely short this season. If a good quantity of these are desired it is advisable to make planting as early as possible.

One of the prettiest midwinter or early spring flowers we have is the primula malacoides. This has proved the hardiest for out-of-door, slightly protected beds of any of the primulas grown in this section. It blooms practically all the year through, the flowers are dainty and delicately shaded, with fine long stems, making it an excellent cut flower.

Those who have an abundance of shade will find cyclamen a splendid plant. Plant seed now in small protected beds and they will be ready for transplanting in early spring and will bloom very quickly with the arrival of the warm spring months. These grow readily from seed and should be more commonly used.

Every spring witnesses a shortage of flowers, and the past year was no exception. We would recommend large plantings of calendulas, scabiosa, centaureas and hennemannia in order

to have good quantities of flowers for the months of January, February, March and April. These bloom in great profusion during that period when flowers are scarce.

FIGHTING THE ROSE APHIS

Rose growers who allow the flowers to be damaged by the ravages of the rose aphis, have only themselves to blame. Although the aphis is widespread over the entire country, as well as abroad, it is easily controlled. Careful spraying of the plants with solutions of nicotine will remove all danger, and neither the expense nor the trouble involved is sufficiently great to be a real obstacle.

The rose aphis is a small insect with a body about one-twelfth of an inch long. The young and some adult forms are wingless, but certain adults develop wings from time to time. The color varies from green to pink. By means of its slender beak the aphis sucks out the juices of the plant on whose buds and unfolding leaves it feeds. These, prevented from attaining their perfect form, become curled and distorted and the beauty of the flowers is in large measure ruined. Moreover the aphis secretes a sweet sticky liquid called honeydew which spoils the appearance of the foliage on which it is deposited.

Under favorable conditions it propagates rapidly throughout the year. For example, some recent investigations conducted in California by the department of agriculture showed that one female gave birth to 48 young in six days. At the end of that time the mother aphis was knocked from the rose and perished. This is not at all an uncommon fate. A heavy rain, which washes the insect away is one of its most natural checks, though birds and other insects prey upon the aphis to a considerable extent. Extreme heat is also unfavorable to the aphis.

The rose lover should not, however, depend upon nature to rid his garden of the pest. A 40 per cent solution of nicotine is much surer and not much more trouble. One part of the solution to from 1000 to 2000 parts of water, with the addition of one pound of whale-oil soap to every 50 gallons of the mixture is recommended in Bulletin 90, "The Rose Aphis," which the United States department of agriculture has just issued. A more convenient formula, when there are only a few bushes to be treated, is a teaspoon of 40 per cent nicotine solution to two gallons of water and one-half ounce of whale-oil soap. The soap should be shaved fine and dissolved in hot water.

Mixtures of this character should be applied as a fine, penetrating spray by means of a compressed air sprayer or bucket pump. Such a pump costs from \$3.50 to \$15. Together with nicotine solutions it can usually be obtained at seed stores. If no pump is to be had, however, the infested twigs should be dipped in a pail of the solution. Care should be taken to use these solutions at strengths no greater than those mentioned above, since injury to the foliage may result through the use of too much soap, or mildew be favored by too strong a nicotine solution.

Application of insecticides should be made on the first appearance of the pest, which varies from the time that the leaves are put forth until the buds begin to form. Applications should be repeated as found necessary.

John Deere Implements

A New Book
Free

Van Brunt Single Disc Grain Drills

Plant any small grain, from alfalfa to bearded oats, corn and peas, even in trash, gumbo or mud.

Van Brunt Drills never choke. Adjustable gate force feed compels an even, continuous flow through each seed tube. Amount sown regulated simply by moving a lever.

Seed is planted at even depth. Individually adjustable springs enable you to give each furrow opener the required pressure for hard or soft ground to make furrows of even depth, and the seed is placed at the bottom of the furrows. All of the grain is up and ready for harvest at the same time.

Van Brunt Drills are light weight, light draft, well balanced and strong. Frame is rigid; hopper does not sag; the gear drive is positive (each wheel drives half the feeds) and the disc bearings are guaranteed to last lifetime of drill. Spring steel scrapers keep the discs clean.

Write us for free booklet, "John Deere-Van Brunt Single Disc Drills." It tells why the Van Brunt plants seed at bottom of furrows of uniform depth, and what this means to you.

John Deere Motor Press

The Press with the powerful eccentric gears. Gears are mounted off center, giving more power on the working stroke, a quicker return of plunger and very desirable action of the self-feed—the three points of prime importance.

Easily bales 2 to 4 tons per hour without any jar or shock.

Powerful self-feed arm and plunger, improved form of drop blocker and automatic tucker insure well shaped, firmly packed, smooth end bales,—the kind that bring the highest price.

Entire outfit is always ready for work. No lining up of engine required.

Wide track front axles with a fifth wheel is why this press stands up so well and is so easily moved.

Made in three sizes for 14x18, 16x18 and 18x22" bales.

Write if interested in Hay Press, Loader, Stacker, Side Delivery Rake or other hay tools—and ask for free book, "Better Hay—How to Make and Market It".

Better Made
Not Made

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against
loss through dishonesty of any adver-
tiser in the Cultivator. We do not at-
tempt, however, to adjust trifling differ-
ences between subscribers and honest,
responsible advertisers, nor will we pay
the debts of honest bankrupts. Notice
of complaint must be sent us within 30
days from date of the transaction, and
the subscriber must have mentioned the
Cultivator when writing the advertiser.**ANNUAL SALE**Directors of the Sacramento
Valley Development Association are
moving toward securing an annual live
stock public sale at the State Agricul-
tural park at Sacramento and in con-
nection with it an exhibit of Califor-
nia products transferred from both
the expositions.We quote resolutions passed at a
recent meeting:"Resolved, That the executive offi-
cers of this association are hereby di-
rected and empowered to aid and fur-
ther by every legitimate means in the
power of this association the develop-
ment at Sacramento of a great annual
livestock sale by which the breeders
of cattle, horses, hogs, sheep, poultry
and other livestock in this and other
western states may enjoy the oppor-
tunities of a central market where the
exhibition and disposal of livestock can
be carried on in a manner at once
convenient for the purchaser and pro-
fitable to the producer."**"STANDARD"**As applied to a fruit box what
does standard mean? The citrus grow-
er several years ago began using
"fancy," "choice," and "standard," as
the three grades of his fruit. Later
exceptionally fine fruit was called "ex-
tra fancy." "Standard" fruit was sel-
dom shipped to the Eastern market.
It was of a low grade and little better
than cull, and was usually sent to
nearby markets, where it generally
brought satisfactory returns to the
grower. It is probable that this grade
will be discontinued or its use mate-
rially lessened.Now comes the apple grower of Wat-
sonville and chooses "standard" as the
term to be applied to his highest grade
of fruit. The peach grower for some
years has used "standard" in this
way. Our State Fruit Growers' con-
vention, or the association which maybe formed, should deal with nomen-
clature of all fruits and terms used
in packing and shipping, harmonizing
them so as to eliminate confusion and
give real value to any designation ap-
plied to any California fruit.**THE FARMERS' LEAGUE**Some of the best work done
during the election campaign last fall,
when amendments, initiatives and
referendums were so plentiful on the
ballot as to be absolutely confusing,
was by the Farmers' Protective
League. Its principal fight was
against the eight-hour bill which con-
tained provisions entailing great loss
on all farmers and ruin to many. It
and a federation of farmers in the
southern end of the state sent out
thousands of pieces of printed matter,
also held meetings in all sections till
a great majority was rolled up against
the measure. The section working
in the southern end of the state ceas-
ed its active work after the election
but the league continued its work,
also continuing the issue of the paper,
the organ of the league. Its activi-
ties resulted in the defeat of some
measures before the last legislature
and in watching the needs of agricul-
ture generally. The burden of this
work has been almost entirely thrown
on a few. The opportunity for bene-
fitting agriculture is so great that this
organization should be maintained.
It will then be ready for the next
attack which may be made upon the
interests of the producer. Amongst
its directors those who have worked
hardest perhaps are Messrs. McKeitt,
Hecke and Dunn.**AVOCADO-AHUACATE**The action of the avocado grow-
ers of California in taking the name
"Ahuacate Growers' Association" has
caused some comment as to the advis-
ability of this effort to change the
name of the fruit. The word avocado
is now beginning to replace the mon-
grel alligator pear combination and
any movement which will tend to dis-
place such a term should be encour-
aged. Ahuacate looks formidable, but
it is really a beautiful sounding word.
We feel, however, that it would be
some time before it could be adopted.To get a line on the general usage
in Florida and the East we wrote to
Mr. Peter Bisset, plant introducer
in charge of foreign plant introduction,
and he writes enclosing letters which
he received from Messrs. L. C. Cor-
bett, horticulturist, and E. R. Lake
and C. P. Close, pomologists connected
with the department. Mr. Corbett
merely refers to the communications
of Messrs. Lake and Close and writes:
"In their judgment I concur."Mr. Lake writes: "This division of
the service has accepted the use of
the term avocado for the fruit men-
tioned. This term is recognized by
the American Pomological Society as
the official term, and there seems to
be no really sound ground upon which
to endorse a change in the name.
'Where a variety (or type) name
through long usage has become thor-
oughly established in American poma-
logical literature it should not be re-
placed or radically modified.'—Code
of the American Pomological Society,
upon which the action of this office
is based."Mr. Close writes: "Since the name
'avocado' is so thoroughly established
in horticultural literature and has been
so generally adopted wherever this
fruit is grown, or marketed I do not
deem it wise to consent to a change
to 'ahuacate,' even though this is the
original name."In forwarding these letters to us, Mr.
Bisset comments: "These letters are
self-explanatory and I fully agree with
the expression contained in them,
which is that in so far as the 'avocado'
is commonly called by this name in
this country it would not be wise to
attempt to change it to 'ahuacate.'"**NEWS FROM THE FRUIT GROW-
ERS' CONVENTION**Regarding the permanent state as-
sociation of fruit growers or a federa-
tion of all the agricultural interests
of California in one great organiza-
tion satisfactory advance was made.
I mean now, along both lines. That
is the movement which was started
to organize a state association of
fruit growers and afterwards became
a movement to federate all agricul-
ture has appealed to many as wise;
also it has seemed wise that the origi-
nal idea should be carried out. The
committee consisting of Dr. A. J. Cook,
F. B. McKeitt, Geo. H. Hecke, Dean
H. E. Van Norman, B. F. Rush, Dr.
Herbert J. Webber and C. B. Messen-
ger, which was appointed by Commis-
sioner Cook after the Los Angeles
convention, met in Sacramento in Jan-
uary and decided that a larger com-
mittee or a committee representing a
larger scope of agriculture should be
appointed. A meeting was held in
San Francisco on February 22, at
which such committee consisting of
Prof. H. E. Van Norman, H. J. Web-
ber, G. H. Hecke, Guy Miller, Chas.
Kimble, Geo. C. Roeding and Carlyle
Thorpe was appointed. This com-
mittee has worked along the line of
the general federation and has a form
of constitution which will be reported
to a general convention to be called
later. This committee also reported
to this convention recommending the
formation of a state fruit-growers' as-
sociation which should affiliate with
the federation. This report was unan-
imously accepted by the convention
and it is presumed that the original
state fruit growers' convention com-
mittee appointed at Los Angeles will
recommend a form of constitution
which will be adopted at the time of
the Visalia convention.The meetings of the horticultural
commissioners brought together prac-
tically all the commissioners of the
state. This meeting is not so impor-
tant as the fall meeting, at which offi-
cers are elected. This spring or sum-
mer gathering is more educational
and gives opportunity for much dis-
cussion as to methods and as to en-
forcement of newly enacted laws. One
feature which has succeeded in get-
ting the commissioners "all het up"
is a sensational story sprung in the
San Francisco papers that a scheme
was hatched by the commissioners in
a star chamber midnight session at
Palo Alto to secure a successor to
State Commissioner A. J. Cook on the
expiration of his four-year term in
October. The commissioners say
there was absolutely no discussion on
the subject. It is also understood
that Dr. Cook will make no campaign
for reappointment, but if the governor
and the fruit growers wish it he will
accept another term of service. In
the discussion about the "Quad"
amongst delegates at the convention
the only other name mentioned in con-
nection with the office was that of
Geo. H. Hecke, county commissioner
of Yolo County. Mr. Hecke will not
make a campaign against Dr. Cook.The meeting in Festival Hall on the
exposition grounds on Saturday even-
ing resulted in a much larger attend-
ance than was anticipated. Prof. John
M. Coulter of Chicago University did
not appear, but Director J. G. Lipman
of the New Jersey experiment station
was present and made an excellent
address on the fundamentals of soil
fertility. He made a distinction be-
tween the European and the American
farmer, in that the American fertilizes
his soil and the European fertilizes his
crop. "We must produce larger crops
as land goes higher in price. To pro-
duce larger crops cheaply requires
thorough understanding of soil condi-
tions and crop requirements."

C. B. M.

Agricultural NotesKansas will hold an International
Wheat Show at Wichita, October 4-14.Many advance orders for Washing-
ton apples have been received from
Australia, Manila and Honolulu.The apple crop of Ontario, Canada,
will be short this year, the output
being estimated at from 60 to 75 per
cent.Brazil's Poultry Association will
hold its second annual national expo-
sition at Rio de Janeiro, September
5 to 8, 1915.What is said to be the largest pump-
ing plant of its kind ever built, having
a capacity of 1,000,000 gallons a min-
ute, has been established in Louisiana
for drainage purposes.Portugal's wheat crop this year it is
estimated will supply the local de-
mand for only about six months.
Beans, rye and oats are all below nor-
mal. The corn crop is, however, above
average.The average price of petroleum in
the United States was \$0.806 per bar-
rel in 1914, or \$0.148 less than in 1913.
The decline has continued, the average
price being probably 10 to 12 per cent
lower than last year. Exports, how-
ever, are becoming more normal.New Zealand farmers are much in-
terested in sugar beets and are in-
forming themselves as to growing re-
quirements, value of pulp for stock
feed, cost of establishing factories, etc.
It is proposed to ask government as-
sistance in starting the industry.Great Britain has agreed to allow
the shipment of sugar beet seed from
Germany to the United States on cer-
tain conditions. The seed must come
from some neutral port, there must
be no other place from which to get it,
and no exchange of products will be
allowed.The favorite drink in the French
army today, as it is in both the Eng-
lish and Russian armies, is tea. There
are many tea-canteens along the front,
where men can get hot cups of tea
on entering and leaving the trenches.
Single canteens sometimes serve
25,000 cups of tea a day.July 27 was Agricultural College
Day in Weld County, Colorado. A spe-
cial program was arranged for the
day, beginning with a visit to the col-
lege buildings, followed by a regular
old-fashioned picnic dinner on the
campus and ending with a visit to
the beautiful horse-breeding farm. It
is hoped that this will become a regu-
lar custom with all counties in the
state.Central America, from the Pacific
to the Atlantic, has been suffering
from a plague of grasshoppers. The
banana plantations have been ravaged
and all crops have been seriously dam-
aged. Last year the pest was so de-
structive that the governments of sev-
eral of the states bought food sup-
plies of corn, beans, rice, etc., and
sold to the people at cost. This will
probably be again necessary.Horses and mules constitute large
exports from the United States at
present. The annual average shipped
abroad for several years has been
28,000 horses, average value \$142, and
5000 mules, average value \$150. Dur-
ing the 10 months ended April 30, 1915,
exports of horses numbered 215,759,
valued at \$47,783,848, or an average
of over \$220 per animal, and 39,229
mules, valued at \$7,478,014, or over
\$190 per head. It is anticipated that
there will be a large demand for these
animals after the war for farm use.

Agricultural News Notes

of the Pacific Coast

Northern California

Very heavy shipments of butter are still being sent to Australia from San Francisco.

The date of the Esparto Almond Festival has been changed to Saturday, September 4.

Successful crops of beans are being raised in Butte County this season without irrigation.

Residents of the Thermalito district of Butte County want an irrigation district established there.

The State Fruit Growers' Convention is being held this week at Stanford University, Palo Alto.

Olive growers of Oroville, in Butte County, are talking of forming a local cooperative marketing association.

A cooperative association of rice growers of Oroville was recently incorporated to mill rice produced by members.

The vintage festival and Napa County farm bureau fair will be a great success if efforts now being put forth are an indication.

The Humboldt County Dairymen's Association picnicked at Loleta the last day of July. This was the third annual picnic of the association.

The Solano County exposition commission has selected Mr. Millard Sharpe of Vacaville to take charge of fresh fruit shipments to the Panama-Pacific exposition.

Chambers of commerce of the Sacramento Valley have organized a Homeseekers and Industrial Bureau which will maintain offices in the Examiner Building in San Francisco.

The Oroville chamber of commerce has begun active planning for the orange and olive exposition which will be held early in December. It is planned also to emphasize the exposition as a county fair.

Sutter County canneries are reported to have made no contracts for fruit, holding to lower prices than growers can accept. Some growers are trying to work out a plan to lease a plant and do their own canning to save this season's fruit.

Growers of cling peaches in Yuba and Sutter Counties are facing a desperate situation with most of the canneries closed and few buyers for their fruit. Some efforts are being made to have growers lease canning plants and operate them for themselves.

The war is a convenient alibi for almost everything, but sometimes causes some very real hardships and damages, as is shown in the announcement by the state horticultural commission that many thousands of useful insects imported to aid in fighting harmful insects, have died in transmission, owing to delays and difficulties in transportation.

Dairymen and creamerymen of Humboldt County are again discussing whether to feed or not to feed turnips to dairy cows. The general opinion seems to be that if turnips are fed too heavily the quality of the butter is seriously affected, therefore, in order to run no risk of injuring the reputation of Humboldt butter no turnips at all should be fed.

Central California

The cannery at Hanford will be closed this season.

Tulare peach growers have formed a temporary marketing association.

The Kerman Cured Fruit Association last week sent out its first dried apricots.

Watermelons are bringing about \$15 a ton to Turlock growers. The crop is a very small one this year.

A special trainload of 15 cars of horses was shipped from Tulare last week to New York, bound for France.

The new dried fruit rates announced by the Southern Pacific to Eastern points will become effective on August 21.

The Selma, Fresno County, cannery has a full crew at work, nearly 500 men and women packing Tuscan clings.

The navel orange crop of the Lindsay district of Tulare County is now estimated at about 75 per cent of normal.

Manteca, San Joaquin County, is now marketing its melon crop, which is proving to be 50 per cent short of last year's.

The newly organized California Ripe Olive Growers' Association is urging Tulare County olive growers to become members.

The Terra Bella irrigation district project has finally been approved by the board of supervisors. An election will be called for August 7.

The Tioga Pass road through the Yosemite national forest, which was recently acquired by the national government, was officially opened July 28.

There is talk of not holding the citrus fair in Tulare County this year because it is feared the new auditorium building cannot be completed in time.

Thompson Seedless grape growers of Tulare County are finding much of their crop already showing a sugar content above the required test and the fruit is being rushed off to market.

The newly formed Watsonville Apple Distributors' Association has been joined by almost every apple grower in the Pajaro Valley and growers generally feel much encouraged by this activity.

During this season's work employees of the California Fruit Canners and Central California Canners will wear caps and aprons furnished by the management. This is mainly to improve sanitary conditions of handling fruit.

Bean growing has been demonstrated a success in Kern County. Large acreages have been planted this season at Lerdo, Shafter, Wasco, and in the district around Bakersfield. Many experimental plots were planted to teparies.

It is estimated that 8000 acres have been set out to Thompson Seedless grapes within the last two years, making an acreage of about 38,000 in the state. There is some apprehension lest the good prices which have always prevailed for Thompson Seedless disappear in face of the ever-increasing tonnage of fruit.

Southern California

Hog cholera is practically banished from the Imperial Valley.

All the sugar factories in Southern California will operate this season.

Beet harvesting is on in earnest in the fields about the Oxnard sugar factory.

The sugar beet harvest has begun in the San Luis Rey Valley, San Diego County.

Despite the walnut blight Orange County expects to harvest her largest crop of walnuts.

A \$10,000 fish hatchery is soon to be established in San Antonio canyon, north of Ontario.

The Anaheim Citrus Association now has a membership of over 200. Six years ago it started with 14 members.

C. P. Taft of Orange has just sent an exhibit of avocados to be placed with the Orange County display at the San Francisco exposition.

The barley yield of Orange County is estimated by the county assessor as one-fourth less than last year's, amounting to only about 150,000 sacks.

The Los Alamitos Sugar Factory in Orange County began slicing July 28. With the opening of the Los Alamitos factory all five of Orange County's beet sugar plants are in operation.

Bean growers of Garden Grove, Orange County, expect to form a cooperative marketing association. They will also consider cooperative methods of cleaning and hauling their crop.

During the month of June the Placentia Orange Growers' Association of Orange County sent East 115 cars of Valencias, receiving for the whole lot \$2.00 net per box, including all grades.

A schedule of rates for the sale of Owens River water to the San Fernando Valley for irrigation and domestic purposes has been placed before the Los Angeles city council for its approval.

Senator D. W. Mott of Santa Paula has compiled some of the more important game laws passed at the last session of the legislature and this compilation is now available for Ventura County sportsmen.

The California Vegetable Union announces that it will build a large packing house at Garden Grove, the work to begin about the middle of August. All kinds of vegetables will be received at the new house.

The deer season in District Number Four opened September 1. District Number Four includes Los Angeles, San Bernardino, Riverside, Imperial, San Diego, Orange, Ventura and Santa Barbara Counties. The season lasts only for the month of September.

Prof. John T. Barrett, professor of plant pathology at the state university, was recently in Hemet, and in company with Deputy Horticultural Commissioner Ellis visited many of the orchards of this vicinity. Prof. Barrett has made a special study of shot-hole fungus. He has arranged to make a number of experiments in Hemet Valley during the fall and winter.

The Coast

Texas is sending out heavy shipments of Alberta peaches.

The prospects for a yield of winter wheat are unusually fine in Montana.

Salt River Valley, Arizona, cantaloupes are bringing top prices this year.

Shipments of this year's wheat are being made from Walla Walla, Washington.

The wheat crop of the Inland Empire is now estimated at 70,000,000 bushels.

Weber County, Utah, has a county farm demonstrator. He is Preston Thomas of Ogden.

The apple crop of Wenatchee, Washington, is estimated at about 75 per cent of last year's.

A broom factory is being installed at Chandler. The local broom straw is now ready for the factory.

The Utah-Idaho Sugar Company of Rexburg, Idaho, has 800 acres on which it is raising beet seed. The crop is reported very good.

Reports from Oregon indicate that the hop pick this season will equal that of the record year of 1906 when 160,000 bales were harvested.

The establishment of a creamery station at Chandler, Arizona, dairymen estimate is saving them two and one-half cents a pound on their butter fat.

Dairymen of the section about Willcox, Arizona, met a United States dairy expert on July 21 to discuss procedure in establishing a creamery at Willcox.

The directors of the Maricopa County Farm Association held their first meeting and lunch in the chamber of commerce rooms at Phoenix, Thursday, July 22.

The American Shorthorn Breeders' Association has donated \$330 to the premium fund of the Cascade International Fat Stock Show to be held in North Yakima, Washington, November 22-27.

The North Yakima cherry season closed July 16 with the shipment of a carload to Montana. One hundred and thirty-one carloads was the total shipment from this point for the season, against 75 carloads last year.

Approximately 145,000 acres of the former Flathead Indian reservation in Montana will be offered for sale at Kalispell and Missoula, Montana, during August under regulations announced recently by Secretary Lane.

A poultry and egg demonstration car is being sent over the railways of Washington by the United States department of agriculture. The car is equipped with refrigerator, egg candling room, testing, grading apparatus, etc.

The stockmen of Colorado, through the Colorado Stock Growers' Association, filed suit against all the railroads operating in the state, on the grounds that they have not complied with the law in the matter of fencing their lines, and that the stockmen are losing thousands of horses and cattle in consequence, for which they receive little or nothing.

SILOS
BUILT FOR YOUR PARTICULAR NEEDS.
EXACTLY AS YOU WANT THEM.
ALL SIZES AND DIMENSIONS

TANKS
BUILT TO ORDER, TO SUIT ALL USES AND
USERS. CHEAPER THAN METAL TANKS.
LAST LONGER. WON'T RUST. CAN BE TAKEN
DOWN AND RE-ERECTED WITHOUT DAMAGE.
CAPACITIES, 500 TO 500,000 GALLONS.
TOWERS INCLUDED IF YOU WANT THEM.

PIPE
MACHINE BANDER OR CONTINUOUS STAVE
FOR WATER SUPPLY, IRRIGATION, ETC. POWER. CHEAPER THAN ANY OTHER PIPE OF
EQUAL SIZE OR CAPACITY. LONGER LASTING THAN METAL PIPE EXCEPT CAST IRON.

SAVING THE WASTES

TO give an insight into some of the little economies in European countries we quote from a translation of a German publication as to drying of potatoes and curing of beet tops for forage.

Drying Potatoes

The methods adopted in drying potatoes use hot gases, steam or hot oil. The first are especially employed for drying sliced potatoes and the others for potato flakes. For drying by means of hot gases, the desiccators used are those on the drum, trough and sometimes on the hurdle system, whilst for steam or oil drying only roller desiccators are used.

The cost of drying by these various methods varies according to the size of the plant and the duration of the work. The longer this is, the lower the total expenses per hundred weight of potatoes. In the second place the cost is determined by the output of the plant, which in its turn depends chiefly upon the consumption of coal. For this reason and especially in the manufacture of flakes, motor engines that work well and at the same time supply the steam to be used in the drier must be used. In drying by means of the combustion gases a good utilization of their heat must be attained. Besides the cost of drying potatoes varies according to the starch content of the same potatoes and the water content of the dried potatoes. The greater the starch content the less moisture is there to evaporate and the greater the quantity of dried potatoes turned out in a given time. With a good plant the average cost of drying is 8.4 to 9.6 cents per hundred weight of raw potatoes if the gases of combustion are used, and 10.8 to 11.9 cents per hundred weight with steam.

The utilization of raw potatoes by means of desiccation depends on the starch content of the tubers, the cost of drying, and the price of the dried potatoes when they are not consumed on the farm itself but are sent to the market.

As dried potatoes are often used instead of foods rich in carbohydrates, such as maize, barley and the like, their price must be considered in connection with that of these foods on the market. In the feeding of horses their price must be compared to that of oats. At a price of \$1.80 per hundred weight for dried potatoes and a cost of 9.6 cents for drying, the writer considers that one hundred weight of fresh potatoes containing 16 per cent of starch is worth 34 cents; if they contain 18 per cent they are worth 40 and 45 cents when they contain 20 per cent. At a price of \$2.06 per hundred weight the prices are respectively 41, 46 and 51 cents.

In selecting the method of drying to be adopted the economical conditions and the uses to which the product is destined must be considered. The writer advises a plant for the production of flakes, if potatoes are the only crop to be worked up and if they are to be used chiefly for feeding to pigs, also if the plant is connected

with a distillery or starch works or dairy and if the quantity of potatoes is not very considerable. If on the other hand besides potatoes, beet leaves, other forage or cereals have to be desiccated, and if the product is to be fed to horses, cattle and sheep it will be preferable to select a plant for the production of dried slices. As for the dimensions of the apparatus it must be remembered that a large plant is not profitable unless the time during which it is worked is fairly long, namely from 150 to 180 days. In the case of a cooperative drying plant the first thing to be done is to make sure of a sufficient quantity of potatoes to be dried. The writer considers that the high cost of cooperative drying is due to the fact that the time during which the plant works is too short.

When the quantity of potatoes to be dried is not enough to keep an independent plant going, recourse may be had to one attached to a distillery, dairy, etc. Before deciding it is necessary to consider carefully all conditions.

The writer is of the opinion that potatoes which are to be fed shortly after the harvest to cattle, sheep and pigs should not be dried. On the contrary those destined for horses should always be dried. Potatoes stored up to the end of the winter suffer a loss of substance amounting to eight and even 10 per cent, and if they are not fed to the live stock until the spring or summer the loss reaches as high as 25 per cent. Supposing the prices of potatoes to be 36 or 48 cents per hundred weight the loss would be nine or 12 cents per hundred weight. The loss caused by storing is about the same as the cost of drying. When the price of potatoes is low the cost of drying is not less than that of ensilaging, but drying affords the possibility of utilizing completely all the nutritive matter, and in years of abundant crops it saves the farmer from having to throw on the market large quantities of potatoes at a low price or to feed them wastefully to his stock.

Desiccation of Beet Leaves

Among the secondary products and residues of the cultivation of beets the leaves present the greatest interest as to desiccation, and this because their ensilage, and their subsequent feeding to live stock present several drawbacks, amongst which is particularly the loss of nutritive matter. This method of using them entails a considerable loss of money as may be seen from the following figures: From 1906 to 1910 in Germany the acreage devoted every year to beets averaged 1,113,700 acres. Admitting the amount of leaves produced per acre to be ten tons, the total crop would be 11,137,000 tons. If it be considered that two-thirds of this amount is ensilaged and that during this process one-third of the dry matter is lost, the loss amounts in round numbers to about 2.5 million tons of fresh leaves, or calculating that five tons of fresh leaves produce one ton of dried leaves, the loss amounts to about half a million tons of dried leaves worth about \$5,840,000.

SORE SHOULDER INSURANCE

If you could get insurance against your horses becoming sore-shouldered when most needed, you would take it at any reasonable price. Why not take it FREE by using

W. DAVIS & SONS'

Horse Collars

"Felt-Face"each \$5.00
"Cushion" Collars.....each 3.00

This "Cushion" Collar is a combination of leather and canvas, guaranteed to cure sore shoulders and "stand the racket."

The "Felt-face" collar is all-leather, first-quality of oak-tannage, hand-thonged throughout. It has a facing of felt under the leather face, producing a soft yet firm surface against which the animal pulls.

It is natural for any manufacturer to say that his collars are "the best," but it is only about "FELT-FACE" collars that letters like this are written:

W. DAVIS & SONS, San Francisco.

Gentlemen:—I sold the Red Bands Orchard Co. two Felt-face collars about a month ago for two sore-neck mules which are all healed up now. They came in today and ordered one dozen. Please send me soon as possible 1½ dozen, from 17 to 22-inch.

Very truly,

W. F. INGWERSON,
(Harness-maker) Visalia, Cal.

A selling agent (dealer) in nearly every town. If none in your town, write us

The desiccation of beet leaves is carried out chiefly in drum desiccators and sometimes also in hurdle desiccators. The various models of the former differ considerably from each other in the construction of the interior and the gradual passage through the drum of the stuff to be dried. The progress achieved during the past ten years in this field becomes evident if the composition and aspect of the product be considered. Formerly the dried leaves were hard and brittle, while now according to recent methods the dried leaves have preserved their original green color; they are soft, elastic, cleaner and possess a starch value of 35 to 38 per cent, instead of 25 to 28 as formerly.

The cost of drying varies, as it does with potatoes, according to the size of the plant and the duration of the work, which, considering the great losses which would be caused by rotting, cannot be extended at will, but averages 70 to 80 days. On account of the shorter working period the interest and amortization of beet leaf drying plants is fairly high. Whilst in potato drying about 4.8 to 7.2 cents per hundred weight is to be debited as general expenses, in beet leaf drying 11.9 cents is to be debited. The writer believes that a notable diminution in general expenses is possible when the plant can be used also for other foodstuffs. Further, the cost of drying is influenced also by the efficiency of the plant and by the amount of fuel consumed. If coal is used about 13 to 14.3 cents is required per hundred weight of dried leaves. Using lignite the cost of fuel is less. Again the cost of drying varies with the amount paid for labor and the use of teams which may be set down at 9 to 11.9 cents per hundred weight, and with the moisture content of the fresh and dried leaves. If the leaves are dried immediately after the harvest the writer states that for the produc-

tion of 100 pounds of dry leaves containing 12 to 15 per cent of water, from 550 to 600 pounds of fresh leaves are required. If on the contrary the leaves are left for a certain length of time in the field, only 350 to 500 pounds, or an average of 450 pounds, are required to produce 100 pounds of dried leaves. The question as to how far this partial drying of the leaves may be carried without incurring too heavy a loss depends naturally upon the weather.

The cost of drying in an installation devoted exclusively to beet leaf drying ranges from 36 to 38 cents per hundred weight of dried leaves. If other forage is dried the cost also diminishes.

As for the profitability of drying beet leaves the writer considers first class beet leaves to possess about the same value as the best meadow hay. If the economic value of the latter be taken at 60 cents per hundred weight, the value of the leaves, after deducting 36 cents for the cost of drying, is 24 cents.

Assuming 450 pounds of leaves partially dried in the field to be necessary to produce 100 pounds of dried leaves, the hundred weight of the former would be worth 5.3 cents, which must be considered as a favorable price. In view of this and of the disadvantages attendant upon an excessive use of silage an extension of the practice of drying beet leaves is justified, especially in breeding farms in which ensilage is often injurious. In milk farms on the contrary, where milk and dairy produce command only medium prices, the use of dried leaves is, according to the writer, of limited advantage because the successful production of milk depends only very partially upon the feeding of concentrated foods. Nevertheless here also desiccation allows of a better utilization of the beet leaves.

Drying Sugar Beet and Mangold Slices

In this field the technique of desiccation has not achieved any considerable progress recently. The number of sugar factories which have erected drying installations has undoubtedly increased of late, which speaks for the recognition of the importance of the drying of the slices.

The market price of mangold slices was, during recent years, higher than their economic value, which was 91 to 97 cents per hundred weight. The price of sugar beet slices stood also higher than their nutritive value.

FEEDING THE CALVES

It has been shown by numerous experiments that the feeding and care given calves for the first year of their lives are very largely responsible for their value as dairy animals. True, heredity is also a great factor, but even with ancestors equal to the best milk producers, the calf must have the right kind of feeds to develop into an excellent dairy animal.

Feeders have found that calves intended for dairy cows should have plenty of feeds rich in protein, that these rich protein feeds have a tendency to develop frame, type, milk glands, udder, etc., necessary for heavy milk production.

It does not seem that there should be much difference between heifer calves, one fed on a ration suitable for developing the dairy cow and the other for beef production, but experiments show that there will be considerable difference.

Animals with poor milk producing ancestors with the best of care are not likely to make great milk producers. Animals with heavy milk producing ancestors may not themselves become great producers. But they are more likely to become excellent producers if the calves are fed the right kind of ration and given good attention than if neglected during the first year of their lives.—Farm and Ranch.

Some of our western butter factories accept any kind of cream without regard to its condition when delivered, and they usually pay the same price for all grades of cream. In some dairy sections noted for the high quality of butter produced the operators have found that in order to get the highest market price for their butter it is necessary to demand a good, clean, raw product. Hence they are grading all cream and paying on a quality basis. As a result the producers are studying the situation more closely, as they realize that they must provide better facilities in caring for their product. Many patrons who deliver sweet cream object to having it mixed with inferior grades, so they find it to their advantage to deliver the product in individual cans.—Denver Field and Farm.

It is generally found that the most successful calf raisers are those who clean the calf pails just as often as they wash the milk pails. The buckets are washed daily and thus there is no chance for bacteria to contaminate the milk before being fed. Remember, in washing any pail that is used for milk, cold water does not kill bacteria. Cold water only washes out the bulk of them. Good boiling water kills most bacteria, and those not entirely dead are finished when the dry pail is placed in the sun.

"In a word the husband should make the money first, and then the wife should make it last."—Washington Star.

Books

This list is prepared with the purpose of enabling our Cultivator readers to supply themselves with standard books at lowest possible prices. We call especial attention to a few of the new publications. "Citrus Fruits" by Professor Coit, of the University of California, covers all phases of the Citrus Industry under California conditions—the kind of a book we have had many calls for but never before been able to supply. "Productive Feeding of Farm Animals" by Woll, will command special attention. "Poultry for Profit" (The Cultivator Poultry Book) by Koethen, another California book, is new and excellent, telling what to do and what not to do with poultry in California; a sure guide to poultry success. The new Standard Encyclopedia of Horticulture, by Bailey, is not equalled by anything of the kind which has ever been published at any time in any language. Special terms of payment and discounts are offered by the publishers through us on this Encyclopedia. Write us about it.

Poultry for Profit

SOME FUNDAMENTAL QUESTIONS

Written for the California Cultivator
By Jean A. Koethen

NDERTAKING a new line of work is never an easy matter. There are always new problems to solve, new channels of information to

become familiar with, and always the struggle to adapt old tastes and habits to new demands and conditions. The "old dog" does not readily learn new tricks, and the older the dog the more difficult the learning. This is obvious in other kinds of work. That it is less obvious when poultry work is under consideration is due largely to the misleading statements so carelessly spread abroad by real estate promoters. For instance, the real estate page of a leading daily recently contained an account of a retired school teacher somewhere (it did not say where) who was making \$5000 a year with chickens on a few acres of ground, and who had kept as many as 8000 chickens on one acre at one time. There may be such a woman, but I do not know her, and if she ever did keep 8000 hens on an acre she did not keep them long.

What does it cost to go into the chicken business, and what income is to be expected? These are questions every intelligent person wishes to have answered before venturing on untried paths.

There lies before me a letter from a lady who says she has "a little experience, combined with common sense and a desire to know more"—a most happy combination, by the way, and one that ought to spell success. She says:

"I have 80 acres of land, and intend to plant it to trees, and in the meantime go into the chicken business and raise most of my feed between the trees. Please send me the following information:

"About how many chickens would I have to have to bring me in \$100 per month? What hens are considered the best layers? About what would it cost to build henhouses and runs for the above number of hens? What is the estimated cost of one hen per year? What is the estimated income from one hen per year? Have you plans for henhouses and runs? If not, could you tell me where to get such plans?"

It is easy to answer these questions in a general way, according to the law of averages, but not easy at all to say what this particular woman might or might not be able to accomplish. The personal factor is bigger than any other in poultry work. Where one person may make but 75 cents a year from each of his hens, another proudly reports an average of \$2.00 from the same breed. In general one dollar per year per hen is as much as it is safe to expect, but many make more. In one of the recent egg-laying contests the hens averaged about \$7 per year, but they were of course exceptional hens.

Allowing one dollar per year as the probable income, it is plain that 1200 hens would be required to produce an income of \$100 per month. With feed at its present prices the number might be greater than this, but here is another unknown quantity. She plans to raise a part of her feed. What difference will this make in the net income? I do not know, for the labor question comes in here, and that is a big question.

The best paying poultry plant is the one-man plant, that is, the plant on which all the work is done by the owner, with perhaps some help from his family. When you begin to hire help, cost of production is mightily increased. Now my correspondent does not mention this point. I do not know whether she plans to do all the work herself, whether she has children who can carry part of the load, or if she must depend on the hired man. One man giving his entire time to the work can care for 1200 or possibly 1500 hens. Can one woman do it? On one Leghorn ranch with which I am familiar 2000 hens are cared for by the owner, his wife and grown son and daughter. On another two brothers, with occasional hired help, care for 1500. On a third a husband and wife, with help from their sons out of school hours care for 1200. In all these cases a large amount of commercial hatching is done in addition to the care of the flock and the raising of chicks to keep up the laying stock. I know a woman, a successful breeder of fancy stock, who, with the help of a boy, raises 600 or 800 chicks each year in addition to the care of her flock of 200 or 300 hens, but she does absolutely nothing else. "I don't even sew the collars in my dresses," she said to me when I visited her.

What does it cost to keep a hen one year? Here again the personal factor comes in. Skill in feeding will reduce bills considerably. Raising part of the feed will reduce them still more. Buying feed in large quantities and at the time when it is cheapest is an important item in economical feeding. Generally speaking, the keep of a hen is in the neighborhood of \$1.50 per year. Just now I would rather allow more than less because of the high price of wheat and bran.

Setting our aim at the net profit of \$100 per hen, and allowing \$1.50 for her keep, it is easily seen that a hen must lay at least eight dozen eggs a year at an average price of 30 cents a dozen to be worth keeping. Here is another factor in economical poultry keeping, the hen. I am not sure which is more important, the man or woman behind the hen or the hen herself. My correspondent asks which is the best laying breed, and whatever I say I shall be treading on somebody's toes. Theoretically, there is no best breed. Practically, the White Leghorn is the only breed that has been thoroughly tried out and found satisfactory for commercial egg production. If you plan to keep 1000 or 1200 hens and to make egg production your main line, the White Leghorn, which is kept on egg farms all over California, is the only breed. If, on the other hand, you think it wiser to aim at a general farm flock of 200 or 300 hens, producing both eggs and meat, there are many good breeds to choose from. I think Rhode Island Reds are rather more highly thought of in this part of the country as a dual

NOW is the time to Feed Coulson's Egg Food

to your pullets as well as your hens, commencing at the age of three months. This enables them to rapidly complete their growth and get down to the business of egg laying.

Write for free book "Chick-ens" and don't be put off with any other egg food.

Coulson Co.
Petaluma, Cal.

purpose breed, but, take the country over, the three American breeds, Wyandottes, Rocks and Reds, stand side by side as farm flock birds. The main thing is to get a good laying strain of whatever breed you choose, and this is easier with Leghorns than with the heavier breeds. Leghorns have been bred for many years exclusively for egg production while the heavy breeds have been bred more or less for points, and while the two are not always antagonistic they often are. I believe there is a new day ahead for the heavy breeds, for they can be made by proper breeding to lay as many eggs as Leghorns, while they also supply mothering and meat.

The cost of building houses and runs is usually estimated to be somewhere around \$1 for every bird housed, but this depends on the amount of labor hired and the quality of lumber used. The man who does his own carpenter work can bring the cost down, perhaps, to 75 cents per bird. Good matched lumber (second grade) is more expensive than rough boards battened, but the boards are likely to crack. A cement floor is more expensive than one of dirt but is more satisfactory. It would hardly be safe in planning to allow less than \$1 per bird, but the cost might fall considerably below that figure.

The cheapest henhouse is the square house, and the unit, for egg-farm purposes, is a house which will hold 50 hens. Some poultrymen put more than this number in one house, but 50 hens as a rule is as small a number as can be housed economically together and as large a number as will do well. Three square feet of floor space should be allowed for Leghorns and about four for heavy hens. Since lumber comes in 12, 14 or 16-foot lengths, it will be cheapest to make the house either 12 or 14 feet square.

A long laying-house for 1200 Leghorns could be made of 20 of these houses or units, each 12 by 14; in other words, the house would be 280 feet long and 12 feet wide, but would be divided into 20 roosting apartments, each containing about 50 hens. The different apartments are connected by doors or doorways, so that every hen may range over the whole 280 feet. The roosts, which are all on the same level (about 2½ feet from the floor), are at the rear of the roosting

house, with a dropping board beneath, so that the floor may be covered with straw and the hens have plenty of room to scratch in in wet weather. Feed bins and hoppers or troughs are built into the front of the house so that all may be under cover. The front of the house is open.

Since a shed roof is the cheapest, this house has a shed roof seven feet high in front and 5½ at the rear. Rough boards covered with roofing paper make a very satisfactory roof, but it is little cheaper than shingles, and it is hard to say which is tighter. Whatever material is used, the roof must be made tight, however, for a leaky henhouse roof, even in "Sunny California" is a delusion.

The arrangement of the runs is a matter of taste and opinion. Some laying houses are built with very small yards, some with large ones, some with none at all. The best plan would seem to be two large yards, one extending the entire length of the house in front, and the other at the rear, with doors at the rear so that the hens can be turned into one yard while a green crop is grown in the other.

But it is not necessary to use the long house, though this is more economical of lumber and of labor in caring for the flock. With the large acreage this lady has, she might find it better to use colony houses, each containing accommodations for from 30 to 50 hens, and to give each house more yard room. This plan is rather more laborious for the caretaker, since it involves a good deal of walking and requires more fencing, but it makes it possible to use more land for forage crops and let the hens do the harvesting themselves. By giving each house two large yards the hens could be given green runs at all seasons, and this is a tremendous advantage. It is said that the splendid laying at the Australian egg-laying contest has been due largely to the green runs on which the hens were kept. The colony houses used when this system is employed are usually smaller than the 50-hen apartments of the long house. A house eight by ten is a very good size and holds 25 hens, but there is no reason why the houses should not be larger, unless they are portable. I doubt whether a flock of 1200 birds could be profitably housed in this way, but for a farm flock of heavy hens it is an excellent method.

Questions

THE EDITOR

and Answers

AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Castor Beans

We have often answered inquiries in regard to castor beans that their production for the purpose of making oil could hardly be profitable with labor conditions as they are at present in California. We recently asked Dr. Snowden for his opinion in this connection and he replies that there is a possible opening. He writes:

"I believe from what I have seen of individual plants and their performance without cultivation or care that the industry can be made a profitable one here, going into it at first of course on a small scale and branching out as the demand warranted it. One ought to be able to harvest a large

quantity of the beans in a day by clipping the bunches and after drying threshing them out on a floor."

Fleas

Fleas are a great pest this summer on our ranch, the men bringing them into the house on their clothes from the barns and corrals. I have been led to believe that where hogs are kept fleas are an inevitable evil. Is this so? The hogs have a wide range, some of the young ones sleep around one of the barns and are fed once a day in a corral.—M. A. B.

The best way to rid a place of fleas is by the liberal use of water. Dry dust which contains a quantity of decaying wood is often found underneath buildings and this encourages the increase of the flea pest. The eggs are scattered from the bodies of dogs and cats over the floors and in the

Poultry Business a Profitable Business

requires a thorough knowledge and practice of the many details connected with Poultry Raising.

the Cultivator Poultry Book

Poultry for Profit

by

Jean A. Koethen, Graduate of University of California

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

An outline of its valuable information—

Making a Beginning	Housing and Yarding	Incubation
Brooding	Feeding	Breeding
Marketing	Sanitation and Hygiene	Fixtures, Conveniences
Diseases and Vices	Ducks and Geese	Turkeys

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on eggshell book, binding full cloth vellum de luxe, at the price of one dollar postpaid.

\$1.00 Postpaid to any address.

\$1.75 with the California Cultivator, weekly, one year.

TREES

Prices Reduced—Ganter and Harmon Avocados, 4 to 7 ft., extra fine field grown trees with large, even heads; on rented ground and must be sold. Our prices will surprise you. Citrus also reduced. Magnolia Nursery, Whittier, Cal.

For Acacias, Avocados, Budded Loquats, Citrus trees, Evergreens, Feijoas, Palms, Roses and all kinds of trees, shrubs, vines, etc. Write for our new catalogue. Robertson Nurseries, Fullerton, Cal.

For Sale—Eureka Walnut Trees, budded on Native Black Walnuts. Choice stock. Order immediately. Don't delay. Wm. Holbe, Fullerton, Cal.

Avocado Buds—Challenge, \$10.00 hundred; Royal, Walker's Prolific, \$5.00; Taft, Harmon, Ganter, Northrup, \$2.00. C. E. Utt, Tustin, Cal.

Nurseriesmen—Pot grown conifers, palms, shrubs and ferns for lining out or potting. Ballou's Nursery, Pasadena, Cal.

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

MACHINERY

USED RANCH MACHINERY, PUMPS, WINDMILLS, TANKS, ENGINES, HAY MACHINERY, PUMPING PLANTS, TANKS, TANKS, TANKS.

WHY BUY NEW? SAVE HALF. MATERIAL GUARANTEED. PUMPS, PIPE, CYLINDERS, RODS, DEMITT CO., 120 N. Main, Los Angeles.

For Sale—Used and new Gas Engines, 2 H. P. up, rebuilt and fitted with modern equipment. 22 years' experience enables us to repair and rebuild Gas Engines correctly. Get prices. Lloyd, 806-808 N. Main St., Los Angeles. F7020—Broadway 4103.

For Sale—One 15 H. P. Western gas engine in good condition with fuel tank, all necessary pipe and fittings, batteries, etc. Also one Gould and one Price No. 4 horizontal centrifugal pumps. Cheap. Hugh T. Thomson, Orange, Cal.

Machinery of Every Description Bought and sold—Buttress & McClellan, 205-207 N. Los Angeles street, Los Angeles. Broadway 8098; A5473.

POULTRY

Just Out—The Cultivator Poultry Book. "Poultry for Profit," by Jean A. Koethen. Published by the Cultivator Publishing Co. Highly endorsed by experts. Over 200 pages, 50 illustrations. Contains simple methods of avoiding and overcoming difficulties. A guide to poultry success under Western conditions. It tells what to do, why to do it, and how to do it. Nicely bound in cloth. Price \$1.00 postpaid, or with Cultivator one year, \$1.75. Send orders to Cultivator Publishing Co., 115-117 North Broadway, Los Angeles, Cal.

Baby Chicks—Rhode Island Reds and White Leghorns. My guarantee safe arrival, full count, strong, vigorous; fine bred chicks, Leghorns, \$3.00 per 100. Will lay in five months. Reds, \$11.00 per 100. Will lay in six months. J. W. Lyon, Gardena, Cal.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. National Poultry Co., 607 E. Third St., Los Angeles, Cal.

Baby Chicks—Electric Hatched. White Leghorns, R. I. Reds, Barred Rocks and Black Minorcas. We are booking orders for Fall and Spring delivery. THE ORLAND HATCHERY, Orland, Glenn Co., Calif.

We can supply you with March hatched S. C. White Leghorn cockerels from champion layers. Every hen on the ranch traped. Our aim—full value, quality and satisfaction. \$1 and \$1.25 each. Hudson Bros., Escondido, Cal.

First-Class Chix—White, Brown Leghorns, R. I. Reds, B. P. Rocks, Buff Orpingtons for September and later. Stock guaranteed. Hawkeye Hatchery, Turlock, Cal.

MISCELLANEOUS

Free for Six Months—My special offer to introduce my magazine "INVESTING FOR PROFIT." It is worth \$10 a copy to anyone who has been getting poorer while the rich, richer. It demonstrates the REAL earning power of money, and shows how anyone, no matter how poor, CAN acquire riches. INVESTING FOR PROFIT is the only progressive financial journal published. It shows how \$100 grows to \$2200. Write NOW and I'll send it six months free. H. L. Barber, 430, 23 W. Jackson Blvd., Chicago.

By having no expensive catalogue we can sell direct to you through our merchandise sales department standard lines of diamonds, watches, jewelry, tools, implements, hardware, sporting goods, etc., at money saving prices. Write us as fully as you can as to just what you want, and we will send full description, and prices that will interest you. Address Newton Poultry Farm, Dept. B, Los Gatos, Calif.

"Smith's Pay the Freight"—To reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

Cedar Posts—Split from Washington Red Cedar. Get our prices before buying. G. R. Kirk Co., Tacoma, Wash.

MUSICAL INSTRUMENTS

Special Piano Offer to country buyers, for a short time only. Any piano or player piano at \$100.00 special discount. Ten different standard makes, styles and finishes to select from. Act quick. Address GIRARD PIANO COMPANY, 517-519 14th St., Oakland, Cal. Established 1873.

We repair, buy, sell and exchange musical instruments; used instruments, good as new, sold cheap. Write for bargain list. Bolander's Fiddle Hospital, 52 Second street, San Francisco.

KODAK FINISHING

Developing, 10c per roll. Printing, 2 1/4 x 3 1/4, 2 1/2 x 3 1/2, 3 1/4 x 4 1/4, 3c; 3 1/2 x 5 1/2, 4c. Denver Store, 706 S. Hill St., Los Angeles.

LIVE STOCK

I have another crop of seventy-five head of BIG TYPE POLAND CHINA BOARS, born in February, sired by IOWA WONDER, who is a son of A WONDER, the GREATEST POLAND CHINA BOAR, LIVING OR DEAD. IOWA WONDER is in the 1000-LB. CLASS. One of his sons from one of my good registered sows should make YOU MONEY. I will sell the best first. On account of being overstocked will sell them at \$20 each while they last, but they will not last long at this price, so ACT QUICK if you want an EXTRA GOOD BOAR FOR LITTLE MONEY. Geo. A. Smith, Corcoran, Cal.

Billiken Herd—Pure bred, pedigreed O. I. C. swine; the big white kind. Ready for immediate shipment; weaned pigs of both sexes; pairs and trios; mated not akin. All these pigs are from big type stock, of extra heavy bone; weight with early maturing quality. Immunized against hog cholera; crated and registered free. Write for descriptive circular and price list. C. B. Cunningham, Mills, Sacramento County, California.

For Sale—12 head of full-blooded Ayrshires for sale. A fine foundation herd for anyone desiring to start in the registered dairy cow business. Contains some of the best blood to be had at any price. For particulars address Moorland Farms, Susanville, Calif.

Grape Wild Farm Thoroughbreds—Guernsey Bulls of A. R. Beeding. BERKSHIRE HOGS. Finest Lard in the state. All ages for sale. A. B. Humphrey, proprietor. Mayhews, Sacramento Co., California.

Cholera Immune Berkshire Pigs—All ages. Registered Holstein bull, Prairie Pieterje 107062, three years old—gentle and guaranteed. Selling to avoid inbreeding—\$300.00. Ricconi Bros., Mountain View.

For Sale—Registered, Berkshires. 25 choice pigs of best breeding from the best strains in America. For prices and description address H. L. Murphy, Perkins, Sacramento Co., Cal.

For Sale—At all times, Jacks and Stallions, driving and saddle horses. Price and stock guaranteed. Phillips and Kingsbury, 2318 G Street, Sacramento.

Berkshires—Pedigreed Boars ready for service. Bred sows, weanling pigs, both grade and thoroughbred, finest stock. C. H. Thompson, Novato, Cal.

Thoroughbred Berkshire and Tamworth Hogs for Sale—Western Hog Company, formed by staff of Newmark Grain Co., Los Angeles. Ranch at Elsinore.

Calves Raised Without Milk—Cost less than half as much as the milk raised calves. Write for free book to Coulson Co., Petaluma, Calif.

Hogs—A few thoroughbred Hampshire Boars for sale. Reasonable prices. L. P. Conway, P. O. address, Sawtelle, Calif. Sunset Phone, Santa Monica 565-M.

Poland Chinas—Young stock; either sex. Write for pedigree. Reasonable prices. Edw. A. Hall, Watsonville, Cal.

Glennview Poland China—Stock for sale. Chas R. Hanna, R. F. D. No. 3, Riverside, Cal.

For Sale—Thoroughbred Duroc Jersey Boars and Gilts, strong and vigorous stock. Fred Hart, Exeter, Cal.

For Sale—Prize Winning Shetland ponies. Selling out. Priced worth the money. Maurice Rucker, Fair Oaks, Cal.

Berkshires—Boar pigs for sale, Butte City Ranch, Butte City, Glenn Co., California.

N. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

SCHOOLS AND COLLEGES

Wanted—About seventy-five young men and women to enter the WESTERN NORMAL on August 30th, to prepare for teaching. Western Normal graduates secure and hold good positions. We assist graduates to secure good positions and promotion. We save you time and money. For information, address, WESTERN NORMAL, J. R. Humphreys, Principal, Stockton, Cal. 634 E. Main St.

Telegraphy—Stenography, bookkeeping, English branches. Positions guaranteed. Mackay Business College, Los Angeles.

RABBITS

Leading Rabbitry in America—Flemish Giants a specialty. Prize winning and heavy weight stock. Scored and sold on their merits. Inquiry and inspection solicited. Catalogue on request. Empire Rabbitry, Empire, Cal.

Bosworth's Imperial Red New Zealand Hares sold at hard times prices. NOTHING BETTER. Geo. M. Bosworth, Geyersville, Cal.

SEEDS AND PLANTS

Burbank Spineless Cactus—Hardest varieties, "Melrose" and "Special." Strong, matured slabs. \$3.50 per 100; \$50 per 1,000. Labranza Ranch, Athlone, Merced Co., Cal.

For Sale—Burbank Spineless Cactus, at prices you can afford to plant them for feed. Send for catalog. S. A. Moore, Huntington Beach, Calif.

DUCKS

Ducks—High class Mammoth Imperial Pekin Ducks for breeders. Best stock in California. Stone Canyon Poultry Farm, near Sawtelle, Calif. P. O. address Sawtelle. Sunset Phone, Santa Monica 565-M.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckeborg Press, 237 Franklin St., Los Angeles.

DOGS

Pedigreed Airedale Pups—\$10 to \$17.50. 635 Acacia avenue. Phone 2734-W. W. R. Whitmore, Fresno, Calif.

FARM LANDS FOR SALE

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

For Sale Cheap, residence lot 50x120, at East San Diego Villa Heights, will let it go for \$100.00; good title guaranteed; act quick. Address Box No. 43, Palermo, Calif.

For Sale or Trade—335-acre relinquishment in Coachella Valley. Fine land, 2 wells, barn, etc. Write me for particulars. A. R. Marshall, Santa Ana, Calif.

WANTED

Wanted—Job on a ranch by a rustling man, ten years' experience, good references; good irrigator and milker, first class on alfalfa culture, used to beans, grain and deciduous fruits. Might rent a place on shares where stock and machinery was furnished. Have wife and two children. H. C. Kinsman, 4019 Albatross street, San Diego, Calif.

Wanted—A man in every town to sell teas and coffees. It's a chance to get into business without cost. If \$25.00 per week means anything to you write now to C. B. Wheeler, 605 Crocker street, Los Angeles, Calif.

Wanted—To hear from owner of good farm or unimproved land for sale. C. C. Buckingham, Houston, Texas.

Wanted to hear from owner of Farm or Fruit Ranch for sale. O. O. Mattson, Minneapolis, Minn.

TURKEYS

Eleven White Holland Turkey Hens and one fine tom. All mature birds and strong breeders. Excellent layers. H. McKusick, Box 733, Calexico, Cal.

sleeping places of the animals. The larva of the insect, which is of a worm-like character, lives on small particles of decaying wood or vegetable matter. We quote from Comstock's "Manual for the Study of Insects" the following:

"Of the domestic animals only the dog, cat, rabbit, pigeons, and poultry have fleas. They are most common on dogs and pigeons. But the species of fleas do not appear to be so strictly limited to particular animals as are the lice and some other parasites; for the species that commonly infests dogs and cats will also attack man without hesitation and in this country seems to be more troublesome to our race than the human flea.

"To rid a dog or cat of fleas it should be dusted with insect powder, pyrethrum, and its sleeping-place thoroughly cleaned. The bedding in kennels should be of some substance which can be replaced frequently, as shavings or straw, and when replaced the old bedding should be burned and the floors wet with kerosene emulsion or some other insecticide that will destroy the eggs and larvae.

"In regions where fleas abound much relief can be obtained by the use of rugs on floors instead of carpets. The frequent shaking of the rugs and cleaning of the floors will prevent the breeding of these pests within the house. As a single flea will inflict many bites, it often happens that a house will seem to be overrun by them when only a few are present. In such cases a careful search for and capture of the offenders will soon remedy the evil. We have found that in catching fleas greater success attends our efforts if the thumb and forefinger be wet before seizing the flea, and the insect be placed in a dish of water before we attempt to destroy it. Otherwise the insect is apt to escape while we are trying to destroy it.

"People that suffer from the attacks of these pests can also gain much relief by dusting the upper part of their stockings each morning with insect powder and by sprinkling a small quantity of this powder between the sheets of their beds at night."

Farm Name

Please suggest suitable name, Spanish or otherwise, for small ranch in Glenn County. At present it is planted to alfalfa, later will have considerable fruit. There is nothing in particular now to distinguish it from many other ranches.—Subscriber, Glenn.

The selection of an attractive farm name is a material asset to the farm, especially if one markets his own fruit and takes pride in putting up a product which will be a credit to the

name selected. We offer a list of eight names suggested by the location. Possibly one of these will appeal to the ranch owner: Glenncove, Glennbrae, Glennview, Glennarm, Glennvale, Glenn oak, Glennrosa, Glennanna.

Here also is a list recommended by the Wisconsin Farmer:

Farms which overlook lakes, valleys, streams, etc.: Lakeview, Valley View, Brook View, Lake Overlook, Lakeside, Greenview, Maple Valley, City View, Maple Grove View, Elmhill, Fairview, Grand View, River View, Overlook, Riverdale, LaBelle Lake View, White Birch View, Hillview, Pleasant Hill, Cedar View, Brookside, Brook.

Farms distinguished by groves, located on hills, etc.: Airy Knoll, Springdale, Elmgrove, Burr Oaks, Pine Grove, Sunny Slope, Rocky Ridge, Maple Lane, Pleasant Point, Royal Oaks, Oak Grove, Honeywood, Hillside, Hillcrest, Point Breeze, Hill Croft, The Alps, Prairie View, Maple Wood, Wildwood, Chicken Ridge, Elmwood, Lone Oak, The Maples, Pleasant Knoll, Long View, Rockhill, Upland, Oak Lodge.

Farms which specialize: Shamrock Holstein, Ivycrest Stock, Happy Home Chicken, Rose Lawn Poultry, Wayside Produce, Duroc Jersey, Cloverleaf Stock, Happy Hollow Stock, Oak Grove Horse, Long View Fruit, Roadside Stock, Jones' Percheron, Homewood Jersey, Fairview Guernsey, Greenview Stock, Meadow Lawn Dairy, Spring Hurst Swine, Ideal Dairy Farm.

General farm names: Elderberry Park, The Everglades, Home View, Park, Pinehurst, Bellemont, Pleasant View, Prosperity, Evergreen, One Mile, Fairview, Pilsen, Allswell, Golden Prairie, Fern Dell, Homeland, Cedar Lodge, Rosendale, Fair Acres, Honeysuckle Park, Cloverdale View, Plain View, Edgewood, Daisy, Clover Nook, Clover Heights, Quietdale, Sweet Brier, Waveland, LaBelle.

Grafting Apple and Loquat

I have a vigorous Bellflower apple tree that bears not more than a half dozen apples each year; also a flourishing large loquat that produces large crop of very small fruit. Would you advise grafting two or more different apples on the apple tree and a better variety on the loquat? When should it be done?—Subscriber, Pasadena.

You do not say how old your apple tree is. If it is still making a vigorous growth, it is not likely to bear much fruit. After it has finished its rampant growth, no doubt it will begin to bear. Bellflower trees always bore well at Pomona. If your tree does not improve with age, graft it over to some other variety or two or more varieties. White Winter Pearmain, Missouri Pippin and Red Astrachan will give you a continual crop of good apples through early summer till late fall. Yes, graft over loquat to Advance.—J. W. M.

Apples should be grafted when trees are dormant just before beginning of growth in spring.

Strychnine for Squirrels

I note in your issue of July 1 a request for information regarding the amount of strychnine to use in poisoning squirrels. Doubtless other methods may be as good, but having had good results with the following I can recommend it.

About sun-up I make the rounds of the runways and holes and cut oranges in halves and place them in prominent places in slight depressions in an upright position, so that the juice will not run off. Then I go around with my strychnine bottle and a toothpick or splinter of wood and after wetting the end of it place it in the bottle and put as much of the poison on one side of the center of the orange as sticks to the wet end of the toothpick. A similar dose is placed on the opposite side of the orange. When I am through I take pains to destroy the toothpick and to wash my hands and knife. I find the strychnine crystals much more effective than the powdered form. At this time of the year the squirrels are very apt to just stick the poisoned grain in their cheek pouches and walk home with it and put it away for a rainy day, while the orange must be eaten or left. Those oranges placed early in the day were most effective.—Joseph Dixon, Escondido.

Veterinary Queries

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Cowpox

What ails my cow's teats? They first appear to be sunburned, then small blistered sores come and enlarge until the teat is all raw. They heal but the trouble returns and we can only get the milk by using a milk tube. Can you suggest a remedy?—Subscriber, Rio Bravo.

The trouble is probably cowpox. The disease may be carried from one cow to another on the hands of the milker. Wash the hands before milking each cow and bathe the teats after each milking with a solution of hyposulphite of soda, one ounce to the quart of water. If the skin is inclined to crack when healing apply an ointment made of two parts mutton tallow, two parts lard and one part of dry white lead or oxide of zinc.

Wire Injury

Have a colt one year old that at the age of two months got its leg fast in a hog wire fence and was cut badly from ankle to hock. After a week's care it was so much improved that it was turned out with the mother to graze and next morning was found with the leg broken. It was given some care but did not do well and was given to me. It is improved now so it will put some weight on the foot but the leg will not heal and stay healed. One abscess heals up and another breaks out.—Subscriber, San Diego.

Since you have stuck to it so long and the colt shows some improvement it may be well to continue a little longer. Try injecting into all the openings a solution of permanganate of potash, one half dram to the quart of water. Wash out the openings with warm water and be sure to inject the solution to the bottom of the cavity. Repeat once a day while any pus shows but when it is inclined to dry up let it alone so it will have a chance to heal.

Swollen Udder of Calf

Have a calf about four months old that first swelled in one of her hind teats and it later spread to the front one. Now one side of the bag is swollen, hard, and feverish and seems to be very sore. What is best to do?—Subscriber, Bachelor.

Such swellings are usually due to the parts being punctured by a sliver, possibly a piece broken off inside. Whatever is causing the swelling, it will probably form an abscess and will have to be opened. There is danger of it ruining the udder and you may have to fatten her for beef.

Skin Trouble

My five-year-old horse has had more or less trouble for two years with itching skin. The veterinary pronounces it due to the condition of the blood but his treatment fails to give relief. Have tried remedies for lice or external troubles, but with no results. There are small lumps on the neck and shoulders and along the back. The hair comes off the lumps. The horse rubs against everything and is especially uncomfortable after working. He is a greedy eater and on hot days is short of breath as if suffering from the heaves. His manure is not in round balls as should be but is in a solid mass and the passages are too frequent.—Subscriber, Hemet.

The bowels being continually out of condition would indicate that at least part of the irritation of the skin is due to internal troubles. Dissolve one pound of Glauber's salts in a quart of hot water. When cool give as a drench. Follow this in three or four days by giving aloin, two drams, turpentine, two ounces, and raw linseed oil, one pint. After this, half an ounce of Fowler's solution of arsenic once a day for three or four weeks can do no harm. A handful of ground flax-

seed in the feed once a day will offset the constipating tendency that the Fowler's solution might have. Would also treat the skin by scrubbing it well with warm water containing two ounces of sal-soda to the gallon. Rinse with clear water. When dry rub in plenty of engine oil. Use a light grade and if you have it, add one ounce of zenoleum to the quart. The trouble having continued so long it may be two or three weeks before you see much improvement.

Chorea or Epilepsy

Can you tell what is wrong with my horse?

He will hold his head to one side and twist it around nearly to his shoulder. Sometimes it looks as though he would fall down. He slobbers a great deal and is nervous. These spells last for a week or two at a time and then it may be two or three weeks before they recur. When the trouble is coming on he holds his head high up to one side and partially opens his mouth. Would like to know what it is and what to do for it.—Subscriber, Yermo.

This is probably a form of chorea or epilepsy. Loco poisoning or a small abscess on the brain would cause some of the symptoms that you describe but they would not last so long nor be intermittent.

Very little can be done for this trouble. You might try giving half an ounce of bromide of potash in the drinking water morning and evening for a few days when you see symptoms of the trouble returning.

NURSERYMEN'S CONVENTIONS

The Pacific Coast Association of Nurserymen will hold its convention sessions in the new Auditorium building at San Francisco, August 12-14. Monday, August 16, will be Nurserymen's day at the Exposition. Local florists have arranged a display at Golden Gate Park during the visit of the nurserymen.

The morning of Thursday will be given to reports of committees and general business. In the afternoon there will be an address by the president, John Vallance; Uniform Horticultural Laws, M. McDonald; Recent Horticultural Legislation, Dr. A. J. Cook; Experiments With Crown Gall, Prof. H. S. Jackson; Quality vs. Quantity and a Wider Distribution, J. B. Pilkington; Reminiscences Concerning Nurserymen and Nursery Interests, E. J. Wickson.

Friday—Valuable Information About Ornamental Plants, Prof. J. W. Gregg; Methods of Propagating Prune Trees, S. A. Miller; Preventing the Importation of Insect Enemies, Frederick Maskew; Cost of Growing Ornamental Stock, John Armstrong; Seedlings and Stock Grown in America, M. J. Crow; The Walnut Industry, Almon Wheeler; Best Paying Shipping Plums, J. E. Bergholdt; The New Roses, John Gill.

The secretary of the association is C. A. Tonnesen. He may be addressed, Box 1604, Tacoma, Washington.

In conjunction with the convention of the Pacific Coast Nurserymen, which is their thirteenth annual, the California Nurserymen will also hold their fifth annual meet at the same time and place.

The program of the California Nurserymen begins on Friday afternoon with an address by President Fred H. Howard. Reports, appointment of committees and general business take up the rest of the afternoon. On Saturday morning beginning at nine o'clock will be given the following addresses: "The Department Store and the Nursery Industry," By Ernest Braunton; "Recent Rulings in re Shipping Plants by Parcels Post," D. W. Coolidge; "The Crime of Being a Nurseryman," W. D. Somerville; Saturday Afternoon: 1:15—"Why Import What We Can Grow on this Coast?," M. McDonald; "Do We Need New Varieties of Commercial Fruits?," E. J. Wickson; "A Publisher's Suggestions to Nurserymen," Frank Honeywell; "For the Good of the Association." A general expression of opinions and suggestions is invited from the floor for the betterment of the organization, and the uplift of the nursery business.

The secretary of the California Association of Nurserymen is H. W. Kruckeberg, 237 Franklin Street, Los Angeles.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Partnership Pumping Plant

A sold to B two-fifths of his farm, and also sold a two-fifths interest in a pumping plant, retaining three-fifths. No water contract was made other than in the contract for sale, each party agreeing to pay his share of operating and repairing the plant. Now B claims that A should pay three-fifths of the expense of fuel and repairs regardless of the amount of water received by A. A claims that each should pay according to the amount of use by each. Who is right? Has A any more right to say who should repair pumping plant than B? If pumping plant was unsatisfactory or worn out, could A put in new plant without the consent of B and charge two-fifths of expense to B?—Subscriber.

The two parties stand in relation to each other of tenants in common. The one is entitled to contribution from the other for expenditures absolutely necessary for the benefit and preservation of the common property; that is, for the proportion of the reasonable expense fairly and in good faith incurred. One co-tenant is not ordinarily responsible for costs of improvement or repairs upon the common property unless he agreed or ratified the making thereof or unless it is shown that the improvements or repairs were absolutely necessary to the enjoyment or preservation of the property. Where expenditures are not for the common benefit of the common

estate there is no contribution. In order that the tenant in common should recover contribution for necessary repairs, he should give reasonable notice to the other. It would seem that inasmuch as B is entitled to three-fifths of the pumping plant and water running therefrom he should be obliged to pay three-fifths of the necessary expenses and repairs, as it is entirely optional with him if he chooses to take less water than that to which he is entitled; in other words, he may claim his full three-fifths water and dispose of it as he may desire, but he cannot throw the burden on the other party merely because he desires to take less.

"Fills Silos as Fast as Eight Teams Can Haul It To Machine"

This satisfaction of a California dairyman is repeated every season by enthusiastic owners on the Pacific Coast

CLIMAX SILAGE CUTTER

That Famous Inward Shear Saves Power

The steel knives, finely tempered, and bolted to heavy knife wheel are easily removed for grinding. Their greatest value lies in the fact that they cut from the outer edges toward the center where cutting power is greatest. Other wheel type machines cut the other way.

These Features All Tend to Save Power

The Inward Shear explained above, the staggered tooth feed rolls make fast feeding possible. Heavy knife wheel, with fans behind each knife, lifts and blows the silage away without clogging. Closed elbow is a great convenience.

It will do maximum amount of work on minimum power.

Write today for FREE catalog and full particulars.

Ask any Climax owner about the durability and economy.

Orange Custard

A Tasty Dessert Peculiarly Appropriate to California

In California, the great orange state of the country, every housekeeper should be familiar with many recipes utilizing the delicious golden fruit in various forms. One of the most tasty dishes of this character is orange custard—a simple recipe for which is as follows:

One pint milk scalded; yolk of 2 eggs; 1 tablespoon cornstarch; sugar to taste. Mix eggs, sugar and cornstarch and pour the hot milk on slowly. Cook over water, stirring constantly till it thickens. Cool. Slice 4 oranges and arrange in a serving dish with layers of sugar. Pour the custard over the whole.

Try this recipe once and you will always preserve it for future reference.

In all recipes involving the use of cornstarch, it is important that a good quality be used in order to obtain satisfactory results. Housekeepers in all parts of the country who have the best success with cornstarch recipes invariably depend upon the famous Kingsford's brand.

Kingsford's cornstarch can be obtained at all modern grocers and costs no more than ordinary kinds. Insist upon Kingsford's and ask your grocer for the little Corn Products Cook Book, which contains the above and hundreds of other delicious cornstarch recipes.

THE ICE-CART

By Wilfred Wilson Gibson in Century

Perched on my city office stool, I watched with envy, while a cool And lucky carter handled ice— And I was wandering in a trice

Far from the gray and grimy heat Of that intolerable street, O'er sapphire berg and emerald floe, Beneath the still, cold ruby glow Of everlasting polar night, Bewildered by the queer half-light, Until I stumbled, unawares, Upon a creek where big white bears Plunged headlong down with flourished heels

And floundered after shining seals Through shivering seas of blinding blue.

And as I watched them, ere I knew, I'd stripped, and I was swimming, too,

Among the seal-pack, young and hale, And thrusting on with threshing tail, With twist and twirl and sudden leap Through crackling ice and salty deep, Diving and doubling with my kind, Until at last we left behind Those big, white, floundering bulks of death,

And lay, at length, with panting breath

Upon a far, untraveled floe, Beneath a gentle drift of snow— Snow drifting gently, fine and white, Out of the endless polar night, Falling and falling evermore Upon the far, untraveled shore, Till I was buried fathoms deep Beneath that cold white drifting sleep—

Sleep drifting deep, Deep drifting sleep—

The carter cracked a sudden whip; I clutched my stool with startled grip, Awakening to the grimy heat Of the intolerable street.

A \$3,000 BIRD

Solomon, or Roosevelt or somebody said, quite a period before the present tariff bill was passed, that speech was silver and silence golden. Now that is all wrong. Speech has a value that is sometimes considerably better than a dollar a word; and this is no reflection on any member of the president's cabinet.

Why, I've got a parrot with a vocabulary worth just \$3,000 and I mention that sum because it is all I have saved since my marriage. It isn't a pedigreed parrot. It doesn't lay Indian Runner duck eggs or any of those fancy breeds which the poultry journals assured us worth \$20 a sitting. In fact that parrot looked so ancient and motheaten that a peddler sold it to my wife for \$1.75 marked down from \$2. She always falls for a bargain.

Yet that parrot could talk a torrent that would put a British militant sufferage out of commission. She and my wife—when nothing better offered—would take their knitting and spend a whole afternoon trying to see who could have the last word.

From the first it was my opinion that my wife got stung on the parrot—the phrase has no kin to the man who was hit in the dining room or the woman who was bitten in the parlor—but you couldn't persuade Molly of this. Even when the bird repeated before company a choice remark I had indulged in when I sat down on a sheet of fly paper that had been laid on a chair by one of the children, and when one Sunday morning as Polly hung on the front porch and all the neighbors were basking in the sunshine, she shouted that Mrs. Ellis was over-dressed and that her new green suit was a sight—a bit of gossip my wife had imprudently indulged in concerning her next door acquaintance—even then Molly's affection for the creature did not lessen one whit.

When at the end of my patience I suggested that we must get rid of the bird, we had an argument that

put the Lincoln-Douglas debate in the shade, and a week later we continued where we had left off. To be serious, something had to be done and I tried to bring Molly to a reasonable view of the situation. The neighbors were certainly annoyed at the continual cackling issuing from our place and within the house there was not a minute's peace. Besides, I argued, the bird was getting old and it would be only humane that we help it get its boat over Jordan's water. But Molly was obstinate. Polly's garrulousness was a sure indication that she enjoyed life and it would be time enough to talk of humaneness when Polly began shedding a feather or two and showing symptoms of failing eyesight, Molly claimed. Very well. From that moment I took matters into my own hands.

Something had to be done and it was plain that I was elected to do it. One night when Molly had gone to bed with a headache I set the bird's cage in an open window, wired back the door of her domain and crept upstairs like a thief in the night. The next morning Polly's voice greeted me with the words, "George, you're a great sinner, you are," and there she sat, snug and sound on her perch, a devil-may-care twinkle in her green eyes. The next day I accidentally dropped the cage into a barrel of rain water, but the door worked loose and she came up shouting a choice bit of profanity which it is just as well not to mention. So after several other futile attempts to get rid of the talking machine I decided to resort to deep strategy. In short, I resolved to poison the creature.

It was not without a battle with myself that I came to this decision. My mind made up, there was no backing down. I hit upon the scheme of introducing a small portion of morphine on a quarter of an apple—a fruit the parrot generally devoured with an appetite equal to that of the fat lady at the circus. This course I thought would serve to introduce the bird to Charon and get a boat ride across the Styx.

I procured the morphine from a nearby druggist and one evening after supper when Molly was putting the children to bed I cut up an apple, sliced off a quarter, introduced the morphine in the form of powder, and wedged the fruit between two of the wires of Polly's cage.

The parrot gazed at me with suspicion and drew off into one corner where she could speculate upon my unusual conduct. I supposed she recalled that I had never invited her to dinner before—which was very true. I wanted to stay and watch the bird devour the bait but the swishing of skirts warned me that Molly was returning and I beat a hasty retreat. Even then I was not sure that she had not seen me but as she said nothing, I knew I had gotten away safely. Ten minutes later when I chanced to pass through the room, lo and behold the apple was conspicuous by its absence and Polly was blinking laboriously on her swing, wagging a valiant battle against the attacks of the sand man.

That night I slept soundly, peacefully. And then very suddenly I awoke and found myself sitting upright in bed listening. Something had disturbed me. In a second I knew what it was. Polly was cackling away lustily downstairs. I couldn't believe my ears. By this time the bird should have been well on her way in Tartarus, should have paid her toll to Charon and had her little boat ride across the Styx and should be viewing the sights on the devil's midway. But here she was, talking excitedly. While I was trying to decide just what was the cause of the bird's loquaciousness, I caught another sound. I needed no other cue for action.

I leaped from my bed, snatched my pistol from beneath my pillow and started downstairs at great speed.

I descended the flight as an Englishman rides horseback—by keeping in the air most of the time and merely touching a step now and then. Anyone following me would have seen nothing but a streak of pajamas flying through chaos and I think many would have doubted that there was a human occupant in them. Hermes with his winged sandals could not have made better time than I.

Before I was half way down I could hear distinctly the words Polly was employing in her oration. "Who are you? What do you want?" She was demanding over and over again—a little piece of vocabulary I had once taught her on an occasion of a book agent presenting himself at our door.

When I reached the last step there came a violent scuffling of feet mingled with excited ejaculations in a man's voice and as I burst into the room two huge filmy figures threw themselves through an open window and were swallowed up in the darkness. I went weak, dizzy, faint at the thought of our money—the money which I would never entrust to local banks—the \$3,000 tucked away so securely in my little safe.

In less time than it takes to tell, I switched on the lights and rushed to the corner. The safe had been drilled in so many places that it looked like a stove burner or a patent shower bath, but the doors still held firm. I went at the combination and in a few seconds I had the safe open. The fortune was there! The world was still ours!

Then I came to the realization of the fact that the parrot had saved the money. I just wanted to fall on that bird's neck and weep in sheer gratitude. "O. you bird," I shouted and then stood stock still in amazement. The parrot was dying before my very eyes! It had done me that last good turn after I had poisoned it! Then and there I made up my mind that I'd save that bird if it took the whole \$3,000 in fees for medical experts and I ran over three chairs and a table to the library and got down our \$2.85 doctor's book.

I consulted the index for the word "Poisons," found it after I had run up and down the page and missed it a dozen times. There they were all listed, seemingly every one but the one I wanted. But at last I came to "Opium and Morphine." This is what our doctor's book said about morphine:

"Prevent the patient from going to sleep. Give ammonia by inhalation and keep the patient aroused by dashing cold water in the face or making the patient walk to and fro. Administer tannin or strong coffee and in extreme cases resort to artificial respiration. One one-hundredth of a grain of atropia should be given hypodermically. Stimulants may be necessary. Efforts should not be relaxed until the patient is out of danger or as long as life remains."

Well, I performed all the directions that were performable. There was some black coffee in the pot and I poured out a cup of this and procured an eye dropper to administer the same. I got the ammonia bottle from the cupboard. Then I opened the door of Polly's cage and cautiously inserted my hand. All went well until my fingers closed over the back. Then the bird came to and for an animal full of several grains of morphine I never saw such action in my life. She went at my hand as a woodpecker goes after a tree and in three seconds my hand felt as though it had been run through a meat grinder. But I persisted and pursued the bird relentlessly. She did several kinds of tangoes about her cage, fighting furiously the while, but in the end I mastered her and brought her out to the kitchen table. Then I thrust the ammonia bottle under her beak and she put up another battle that had Mr. Jeffries beaten to a standstill. After she had recuperated I started after her with the eye dropper full of coffee but this proved so impossible after the first attempt that I abandoned it and contented myself and Polly by poking her head right down into the cup. She came up gamier than before and we did the third round of the struggle, both going to our corners at the end of it a bit groggy. There was one consolation in this whole bit of ludicrous procedure—ludicrous now,

but dead serious then—I was at least keeping the parrot awake.

At this pretty little crisis in the game Molly herself walked in upon me. I stood there and grinned at her—you know the sickening grin a fellow gives in such predicaments. I felt about as comfortable as a man seating himself in the electric chair.

Molly started at me and then came the inevitable question. "For heaven's sake, what are you doing?"

I did some more grins and tried my best to swallow my Adam's apple. The one little effort I made at speech brought forth such a funny sound from my throat that I checked the noise and remained silent.

But she asked the question again—you can't get away from answering a woman.

"We were nearly robbed—Polly talked and awoke me and I got down in time to frighten the burglars away before they had gotten our money. Just look at the safe, how they drilled it," and I pointed almost in pride at my safe.

But Molly's eyes never left mine, which little trick didn't ease my spirits one whit. She came over and took the bird from my hands—and I noticed she didn't attempt to mistake Molly's fingers for a steak, as she had mine, and she put her back into the cage.

"Well, my dear husband, let this be a lesson to you. You don't need to confess; I can guess the rest. When I came downstairs from putting the children to bed I caught a glimpse of your coat tails getting out of the room. I knew you'd been up to some deviltry. I noticed the apple in Polly's cage. I didn't think you'd go so far as to attempt to poison the poor innocent creature, but as you had never been known to feed the parrot before, to be on the safe side I removed the apple before she had touched a morsel of it."

The lump in my throat suddenly exploded into nothing and my heart which had been wandering all over my insides during the last half hour slipped into its proper socket with a jolt—Successful Farming.

IDEAS FOR THE COOK

Written for the California Cultivator
By Isabel Cottle

Breakfast

Baked Halves of Peaches
Eggs Baked in Cream
Corn Meal Rolls
Coffee

Lunch or Supper

Salmon Mold
French Fried Potatoes
Lettuce Cocktail
Peach Shortcake
Cheese Biscuits
Tea or Milk

A Delicious Jam

Try the Following Recipe This
Preserving Season

One of the most favored treats with the little folks and many grown folks is bread and jam. This being the season of the year when jam making is in progress all over California, the following simple recipe should be clipped by every woman for ready reference:

One pound fruit; ½ pound sugar; ¼ pound good corn syrup. Time: One to two hours or until fruit drops heavily from spoon. Wash fruit, pare and core if necessary. Mash berries, currants, and gooseberries; slice other fruits. Place fruit in layers with sugar and stand long enough to extract some of the fruit juice. If dry a cup of water may be added. Heat slowly and cook till thick. Jam may be tested on a cold plate in the same way that jellies are tested. Stir frequently to prevent burning. Turn into sterilized glass and seal like jelly.

To obtain the best results with this recipe, the use of the brand of syrup known as Karo (Crystal White) is recommended. In fact, this syrup can be used in all your preserving in place of all sugar.

If you have never used Karo (Crystal White) syrup, do so this season. It can be obtained at all modern grocers.

Dinner

Panned Chicken, Browned Sweet Potatoes
Roast Green Corn Lima Beans
Tomatoes, French Dressing
Chocolate Pie Coffee.

Cornmeal Rolls

One and one-fourth cups flour, two tablespoons shortening, one egg, one-half cup milk, one tablespoon sugar, one-half teaspoon salt, three-fourths cup cornmeal, four teaspoons baking powder. Sift together flour, cornmeal, salt, baking powder and sugar. Rub in shortening with finger tips, then add egg well beaten and milk. Roll out, cut into rounds with a large cutter, brush over with melted shortening, fold over as for Parker-house rolls, brush tops with beaten egg or milk and bake in hot oven ten minutes. This recipe makes 15 rolls.

Salmon Loaf

One can Alaska Red or Sockeye salmon, one cup cracker crumbs, rolled very fine; one egg, one tablespoon melted butter. Season to suit taste. Pick out all skin and bone from the salmon and stir until there are no large pieces. Add cracker, egg and seasoning and stir all together. Stir in the melted butter and add cold water enough to make quite moist. Put in bag or form in shape of loaf and roll tightly in damp cloth. Steam one and one-fourth hours. Remove cloth. After the loaf is cold slice and serve as you would cold meat, with lemon or salad dressing if desired.

Lettuce Cocktail

One crisp head of lettuce, four tablespoons tomato catsup, two tablespoons olive oil, two tablespoons Worcestershire sauce, four hard-cooked eggs, four tablespoons vinegar, three tablespoons sugar, four small onions, salt to taste. Shred lettuce and cut eggs and onions up rather fine. To the olive oil add tomato catsup, Worcestershire sauce, sugar, vinegar and salt. Pour over lettuce, eggs and onions. Serve very cold in cocktail glasses.

Cheese Biscuits

Four teaspoons flour, six tablespoons grated Parmesan cheese, three tablespoons shortening, one yolk of egg, two teaspoons cold water, salt and paprika to taste. Mix flour and cheese; add salt and paprika. Rub in shortening lightly. Mix yolk of egg with water, add enough of these to mix flour, etc., to stiff paste. Knead till smooth on floured board, then roll out thin and cut into biscuits. Bake in quick oven eight to ten minutes, watching carefully to prevent burning. These are good warmed over.

Chocolate Cream Pie

Two squares chocolate, one-fourth cup cornstarch or flour, one teaspoon butter, one pint milk, two egg whites, one-half cup sugar, three egg yolks, one-fourth teaspoon salt and one teaspoon salt and one teaspoon or less of vanilla, according to strength. Melt chocolate, add sugar, cornstarch, egg yolks, salt, butter and milk. Cook in double boiler till thick, stirring constantly; flavor. Pour into a baked pie crust shell, cover with meringue made by beating the two egg whites until stiff and adding two tablespoons sugar. Brown in oven and serve cold.

HOUSEHOLD QUERIES

Roselle Jelly

Please give recipe for roselle jelly.—Subscriber, Downey.

In preparing take the pod of roselle between the thumb and forefinger of the left hand, thumb end up; cut off the stem and the basal end of the calyx to where the seed pod is united with the calyx, when a slight pressure with the fingers holding the pod will force out the seed pod. The calyx may then be used for making sauce, jam, and transparent, bright red jelly. Although we have had no experience in the making of roselle jelly, the process is said to be the same as that followed in the making of currant jelly, a tried recipe for which follows: Wash fruit, drain, place in receptacle in which it is to be cooked and mash. Pour on a small quantity of hot water and cook until slightly softened. Remove from fire to jelly bag and press out the juice. Measure the juice, return to fire and allow to boil stead-

ily for 20 minutes. In the meantime for each cup of juice measure three-fourths of a cup of sugar. Place this in a moderately hot oven and allow to become well warmed through. At the end of the 20 minutes' boiling of the juice add the hot sugar, allow to boil up well, and pour at once into glasses. When cool pour melted paraffin over the tops of the glasses, tie up and store in dry, cool place.

CANTALOUPE BUTTER

In last week's Cultivator Adviser James A. Armstrong of Maricopa County, Arizona, asked if readers had ever tried cantaloupe butter. That question caused readers to ask Mr. Armstrong how to make cantaloupe butter. This question he turned over to Mrs. Armstrong, and we are glad to give her recipe this week:

Select ripe melons, slice them and remove rinds, seeds and soft parts. Place the melon in a preserving kettle with a little water and boil until tender. Press it through a colander and measure the pulp; add one-half cup of sugar, the juice of one-half lemon and a very little cinnamon to each quart of pulp. Continue to boil it until it is the consistency of apple butter. Pour into jars and seal while hot.

Ants Doomed

A Discovery Which Means the End of This Annoying Insect

If you told the average housewife that there was no need to suffer longer from ants, she would look upon you as an inexperienced dreamer who had never come in contact with the ant pest in a practical way.

However, the fact remains that the ant is doomed. Although hundreds of remedies have failed, one has at last been devised that spells the finish of the ant.

A baker and candymaker in Los Angeles was almost driven out of business by a terrible scourge of ants, which overran the entire place. Driven desperate by the annoyance, after much experimenting, he devised a simple paste which rid his entire shop of the plague in one day.

So successful did it prove that it was decided to place it upon the market for general use, and a large factory is now required to produce it in the immense quantities necessary.

This little remedy is known as Kellogg's Ant Paste and can be obtained at all modern druggists or grocers. Try it once.

Gas-Stove Convenience with Kerosene

A good oil stove is like a gas stove—ready at the touch of a match. Any degree of heat you want *instantly* by simply raising or lowering the wick.

New Perfection Oil Cook-Stove

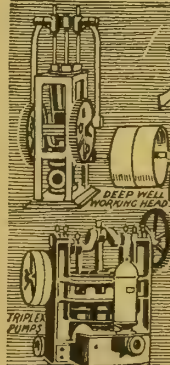

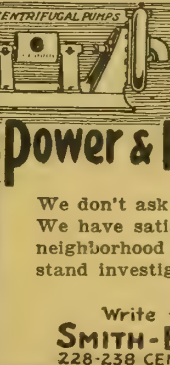

For Best Results Use Pearl Oil

Burns oil, the clean, cheap fuel. It roasts, toasts, broils, bakes—better than your kitchen range. No wood, coal or ashes to lug—no soot or dirt—no odor—does not taint the food. And your kitchen is always *cool*. Several sizes and styles. Ask your dealer. See Exhibit, Palace of Manufactures, Panama-Pacific Exposition.

FUTURE OF THE ALMOND

(Continued from Page 127)

duced this differential to a duty of four cents per pound on the shelled and three cents per pound on the unshelled almonds. The wisdom of this change is yet to be demonstrated. We know, however, that we on the Pacific Coast are pulling against the tide, while the European grower is simply drifting. We know that to insure profitable sale for a greatly enlarged output we must extend the markets and induce more general consumption of almonds. The call is out for every grower to help. The task before us is a stupendous one. A successful continuation of almond growing here demands organized, aggressive cooperative work. The duty of the grower is not ended when he sacks his crop. Foreigners are appropriating our markets and anticipating the needs of our people. We must popularize our products, advertise their desirability and cheapen their production. Many of the vexatious problems pertaining to location of orchard, varieties

to grow, pruning, spraying, cultivation, etc., have been fairly well worked out. Growers know about what it costs to produce almonds. Those who have tried it, know of the difficulties of selling in the open market. The more thoughtful growers realize that the greatest problem confronting the almond industry of California today is that of marketing the product.

About 1898 local associations of growers began to be formed. These were a benefit from an educational standpoint at least, for they taught the benefits of cooperation. They generally combined for selling purposes the greater part of the almonds produced in the immediate vicinity of the location of the association. Their sphere was limited. They had no selling agencies, depending on what seemed to be competition among the commission houses and speculators. They were not in a position to even obtain data on which to place a fair valuation of their crops. They were surely and safely in the hands of the enemy.

Previous to 1910 little had been done by California growers either to develop or protect the market for almonds. Each individual, isolated grower was a complete selling agency within himself. He was supposed to be a walking encyclopedia of almond lore. He was eagerly sought for by the agents of the commission houses and was legitimate game for the speculator. Under these conditions ridiculously low prices ruled for the grower while the consumer was taxed to the limit. Actual entries in the books of growers of this time show that Nonpareil almonds were sold at prices ranging from seven to ten cents per pound. The buyer, interested only in the goods he had acquired at a low figure, had no thought for the future of the industry. He took all the profit the traffic would bear. The markets were demoralized. The demand for almonds was confined to the few. The speculator usually bought early and on a safe margin. He imposed upon both producer and consumer and made of the almond an article de luxe.

Only during the last five years has the California almond situation been studied from a commercial standpoint in the interests of the growers. Beginning in 1910 with six local associations and 230 members, a start was made by "The California Almond Growers' Exchange." It was purely a pioneer effort based on a determination to secure to the growers the profits of the business. Those who had reaped rich harvests at the expense of the growers saw in this movement the killing of the goose that was laying the golden egg.

Organization has progressed until today there are 18 associations and nearly 900 members. These are located in the almond growing sections from Tehama on the north to San Bernardino on the south. The Corning association, representing about 50 tons, has recently been organized and is affiliating with the exchange. The Guinda Association, in Yolo County, with 120 tons, a fire-proof warehouse and complete equipment, has for years been an independent association. A long and careful investigation convinced the Guinda people that they were on the wrong track; that if they were to accomplish anything in building up the almond industry, they must train with those who are doing that line of work. Tired of competition they turned to cooperation and joined the exchange.

During the month of June of the present year 300 tons of almonds were added to the output of the exchange for the season of 1915. The exchange has never lost an association. The associations have lost but few members. About 80 per cent of the California crop is now handled by the exchange. The remaining 20 per cent is sold independently and generally for less money than is realized by exchange members for the same class of almonds. These sales furnish ammunition for the brokers who are doing their utmost to discredit and discourage cooperation among growers. The independent seller unwittingly pays a commission for his own undoing. That the speculator makes a profit goes without saying. That profit belonged to the grower and had he been a member of the exchange he would have gotten it. Were it not for the almonds sold by non-members of the exchange the speculators and demoralizers of

the markets would have nothing on which to operate and would be forced out of the business. It is no less to the interest of the consumer than it is to the producer to eliminate the speculator.

The Almond Growers' Exchange has had a healthy growth from its inception. It is placing the almond business on a firm foundation. It has done much to eliminate speculation and to steady prices. It markets the almonds of its members at cost. Its equipment for handling the business, while efficient, is neither elaborate nor expensive. The aim in view at all times is to return to the grower every dollar possible from every sale made. It names and maintains a price based on crop conditions. It adopted and maintains a high business standard. Starting without capital and without credit, it has advanced financially, until it is now in a position to handle the output of the state with ease. It has already begun that development which will ultimately enable the California grower to make a strong fight for the almond trade of America. It is but an infant now; when it reaches maturity it will be a giant capable of commanding attention. It should have the hearty support of every grower. Already it has developed a satisfactory selling scheme. It has reliable agents in all the large Eastern markets. It has gone into territory and developed trade in sections hitherto neglected. It has taken care of all the old markets and has developed many new ones. By its methods of distribution it encourages increased consumption. In the aggregate this work has made a respectable showing. It has studied the needs of various sections and has learned how best to place the several varieties. What has the outside seller contributed to this work?

The exchange has studied foreign methods and has mapped a campaign in the contest for what we believe to be our share of the business. Noting that 80 per cent of the imported almonds are shelled, while but five per cent of the California product is shelled; that there is a better market for the shelled goods, the exchange determined to make that market available to the California grower. It took up the work a year ago and now has at 19th and C Streets in Sacramento, a large fire-proof building devoted exclusively to almond shelling. It is equipped with modern machinery and labor saving devices. This year extensive improvements are being made and the plant enlarged. The capacity of the plant is now supposed to be one carload of meats per day. This will enable the exchange to compete on a commercial scale with the imported product and will also relieve at times

congestion in certain varieties. The cost of the shelling plant was about \$14,000, and best of all it is paid for.

This plant is the property of the loyal members of the several associations. It is one of their investments made to insure the permanency of the business. It represents money saved through cooperation. It equips to make and save more money. It was built out of the surplus from several funds, remaining after the growers had been returned annually the highest market price for their almonds. No special assessment was ever levied for the building fund. No grower was ever approached for a subscription. It was done so quietly and so easily that but few of the contributors knew that cooperative methods were building a lasting monument to their loyalty and business forethought.

Not one of the non-members or the independent associations contributed a dollar to this great achievement. On the contrary their influence had to be overcome, costing both time and money. When the associated almond industry of California shall have won its victories and occupies the position to which it is entitled, it will be a source of pardonable pride for any participating association to claim a share in these pioneer efforts. To what does the independent seller point as his contribution to the good of the calling?

The future of the almond in California depends upon the degree of cooperation practiced among the growers. Cooperation in selling is a modern idea, and in this line the grower needs education. The situation is full of hope. That 80 per cent of the growers of the state should have cooperated and built up a successful selling agency within and during the first five years of the experiment is cause for gratification. The remaining 20 per cent of the growers have been benefited annually through the existence and influence of the exchange, from \$50 to \$100 per ton on their output. This is their dividend on the business ability of their fellow growers.

The outside tonnage is needed in the exchange. An increased volume of business means a decreased cost in handling the product. If we are to succeed in the contest against the imported almond we must concentrate our efforts. The greater the volume of our business, the better our standing in the business world, the easier to obtain rates, gather data and secure recognition in the markets. California alone can supply our nation's demand for almonds. Whether or not she ever becomes a dominating factor in that supply depends largely upon the support her growers give to cooperative marketing.

\$585 Buys This Combination Farm Tractor and Portable Engine

(F.O.B. Minneapolis, Minn.)

A Bull Tractor running a centrifugal pump in the Sacramento Valley

A Lady Bull Tractor operator in Los Angeles County

The BIG BULL is an all-purpose tractor, built to do all traction work on the farm. The Big Bull's price not only puts this proven money-maker and money-saver within YOUR reach, but actually makes horses TOO EXPENSIVE TO BUY OR KEEP. Think what the BIG BULL will do on your farm. It does the work of several horses and men. Does it faster, better, much cheaper. BIG BULL does all your plowing, discing, seeding. Runs manure spreaders, draws heavily loaded wagons, pulls hay loaders, mowers, binders. Runs corn shellers, feed grinders, small shredders, threshers, and ensilage cutters. BIG BULL is not only a powerful, economical tractor, but a PORTABLE ENGINE as well. Fifty-five hundred now used. BIG BULL is making money for farmers in every section of the United States. Never before was a farm machine so universally welcomed. YOU have undoubtedly always wanted a hard-working, labor-saving traction engine on your farm. Now's your chance to get one—at a price that breaks all records.

BIG BULL is entirely out of the experimental class. It has thoroughly demonstrated what it can do, working in all kinds of soil for the past two years. It can be conveniently and effectively used for SUMMER FALLOWING.

"BIG BULL"

Produces 20 Horsepower at the Belt, 7 Horsepower at Drawbar

The bull wheel runs IN THE FURROW, yet does not pack the soil. Grousers four inches long on the bull wheel make it a deep-tilling sub-soiler. Hard sub-soil, even hardpan, is easily penetrated, loosened up and made ready for irrigation. Patented leveling device on BIG BULL makes it easily possible to adjust the tractor to side hills or deep furrows. Other features exclusive with BIG BULL are its direct drive with only four gears; steer wheel which runs in the furrow in direct line with bull wheel makes BIG BULL positively and automatically self-steering. Just remove two bolts and BIG BULL'S engine is in plain sight, every part easily and quickly accessible.

BIG BULL is not a "ONE USE" piece of machinery. It is a COMBINATION machine, used on a farm as a traction engine and a

portable engine. No team is required to drag BIG BULL into position. It follows your guiding hand from one job to another, and saves you time, work and MONEY ON EVERY ONE OF THEM.

You need this valuable book. Send for it TODAY. Learn what BIG BULL can do for you. Remember that BIG BULL'S price, \$585, makes it an actual WASTE of money for you to continue working horses. BIG BULL works one-third faster than your best team and costs you NOTHING when not in use. BIG BULL is the best investment you can make. It immediately puts you in the class with the big successful farmers and ranchers who wouldn't think of operating their farms without a traction engine. They know it's the ONLY real economical way. So will YOU know it after you have worked BIG BULL on your place for two hours. Get our free tractor book NOW.

We have a few "Little Bull" Tractors left at \$495. Five Horsepower at the Drawbar, 12 Horsepower at Pulley Belt. There won't be any more after our present stock is exhausted.

The Apricot in the Santa Clara Valley

Leonard Coates Writes for Cultivator Readers of the Culture of the Apricot,
Giving Particular Attention to Pruning

THE apricot is a crop of very great importance in the Santa Clara Valley, which section may easily be made to continue headquarters for this luscious and popular fruit. Not only is the profitable culture of the apricot on a commercial scale in these parts a very great success, but it has been so for half a century. This does not mean that the development of apricot land has reached its limit by any means, as there are thousands of acres of land admirably adapted to the production of this fruit throughout the valley, on both sides, especially on the east and south to below Gilroy.

Statistics show that the yield, as with other crops, fluctuates very considerably, as may be seen from one example, viz. that in 1908 the total output of apricots from the state was 19,000 tons, and in 1913 something over 9,000 tons. Only once has this larger figure been exceeded. So it does not look as if the apricot was in danger of being "overdone."

At this time—midsummer—when the apricot harvest is over, growers are particularly interested in the care of their trees and the best methods to employ in order to keep them in the best bearing condition.

Pruning

Pruning the apricot should then receive first attention, although such work is usually supposed to be performed while the tree is in its most dormant state. There is a reason for all of these things, and to be cognizant thereof it is necessary to know something of the habit of the tree. The apricot before its bearing period is a most rampant grower, throwing out side branches, or laterals, from its very start in the nursery. It used to be the practice to cut off all of these laterals and head the tree at planting time to 16 or 18 inches from the ground. As a digression, I would remark that "from the ground" is an expression somewhat ambiguous in its acceptance. In loose, sandy soils trees are often planted, four to six inches, or even more, below the bud. If done in heavy soils, it would be injurious, and would often cause the death of the tree. On the whole it is better always to set a fruit tree relatively as it has already grown and as nature intended it should grow, which is that the "collar" or point between root and stem, should be at or just below the surface of the ground. Never mind about the roots, they will take care of themselves provided the soil is kept in proper condition and sufficient moisture is available.

It is better to let the trees when planted be from 20 to 24 inches from the ground in height, and also better to leave several of the laterals cut back to three or four buds. The buds

on these laterals are the first to start, the leaves on them to open, and normal growth to commence. If they have all been removed the buds on the main stem, having lost their protection, are more apt to be injured or they have been injured in too close pruning of the laterals. In this case—and it very often happens so—the clipped tree becomes so gorged with sap that a condition known as "sour-sap" is liable to occur, or the tree will get sunburned and begin to "gum" even the same season it is planted.

As remarked before, the apricot is a very rampant grower while young, the roots pumping up sap with great vigor as soon as the first warm weather is felt; this is usually early in March. This sap must be assimilated, and for that reason it is necessary that plenty of buds be left on the tree which are uninjured and therefore ready to start into growth as soon as the first flow of sap reaches them. No pruning is required the first summer unless possibly to balance the tree by shortening some shoot which is having too much its own way.

The following spring, or about one year from the time the tree is planted, it must be carefully pruned, which, however, requires more common sense than skill. The operation consists in cutting almost everything away except three branches, and these should be cut back to six or eight inches; it is better to leave some small laterals, or future fruit spurs. These branches should be selected so that they are several inches apart where they start from the main stem. This is to prevent, as far as possible, the branches from starting all at one point in a whorl.

The Second Summer

During the second summer and beginning quite early shoots starting on the underside should be at once removed, as well as those that have a tendency to grow towards the south. The reason for this is that as the prevailing summer winds are from the northwest in the Santa Clara Valley, it is important that growth to windward be encouraged, and the reverse to leeward. The object the second summer is to start four or five strong shoots on the upper side of those cut back the preceding spring, so that they grow in an upright direction. A moment's reflection will convey the idea that, so started, a strong foundation is already laid. The reason, by the way, for deferring the pruning alluded to, and cutting back the young trees in the spring instead of in midwinter, is that it thereby tends to lessen the danger from sour sap.

The small laterals and fruit spurs should be shortened in to three or four inches, and much of the strong wood growth, or suckers, removed at an early stage to give these spurs a

chance to live. These spurs should be most carefully preserved in this manner, as they will bear the future crops but cannot exist if crowded out and smothered by a coarse wood growth. An apricot orchard should begin to bear the third year and yield a fair crop the fourth, but this depends mainly upon the preservation of those spurs which will produce fruit close to the main limbs and near to the ground. If the main upright growing branches grow very vigorously, which they will very probably do, it may be advisable to shorten them early in the summer.

It should be remembered, however, that all of this early summer pruning is but auxiliary and is rendered necessary by reason of the usually rampant growth.

This pruning is supplemented by a later pruning as soon as all growth is stopped, which will be in August or September, depending largely upon the moisture in the soil. It should not be done too early, as this would cause the summer buds to start growth instead of remaining dormant until the spring.

At this time the main branches, four or five in number, should be cut back to about 16 or 18 inches from the previous season's growth. All spurs which have not already been shortened in, should be attended to at once.

The Third Summer

The third summer these various operations are all repeated, the amount of wood to be cut out being more than doubled however. Shorten spurs as usual, of last year's growth as well as of the current season's and keep the center of the tree well opened.

There are two extremes of pruning the apricot in California; both should be avoided. One method often practiced farther south and near the coast is to retain one main central branch or "leader," making a taller tree; the other, a plan much followed in Solano County, is to grow the trees very low and spreading, in shape like an inverted umbrella frame, or even more open. This is done to encourage very early ripening of the fruit, but at the expense of the tree. There is no more beautiful sight than the apricot tree trained in a modified vase or goblet form and with the fruit spurs jealously cared for so that the rich golden fruit literally clothes the main branches from within two feet or less of the ground.

Summer pruning of the apricot is strictly in line with that axiom in horticulture, "prune heavily, and when dormant, for wood; prune more lightly, and in summer, for fruit."

The Fourth Summer

The fourth summer the trees will

bear a little fruit, perhaps it may be a crop. When this is gathered the trees may be pruned, unless still growing, in which case it is better to wait a few weeks. The principles, as here laid down, are ever the same. Continue the same operations, always remembering to take care of the fruit spurs. If the spurs are not annually shortened; if the wood growth that robs them is not removed; if the main branches are not sufficiently shortened, the apricot tree will be proportionately less profitable.

There are many other points to consider in regard to growing and maintaining a profitable apricot orchard, some of which may be briefly enumerated: Location, if level, to be sufficiently high to prevent liability of injury from spring frosts, if near the coast this need not apply; or a gently sloping, or even a steep hillside, where air drainage as well as water drainage is perfect. This is nearly ideal. The soil for the apricot root must be very deep, and well drained. For the apricot on peach root a free, warm soil but with more surface moisture; and in heavy soil, or where there is spring seepage, nothing but the plum root should be used. The Myroblan is most popular, because best known, but there are other plum stocks which are preferable.

Culture

The apricot, being naturally a very vigorous grower and maturing its fruit early, rarely requires summer irrigation.

If the average rainfall is less than 12 inches the land should be winter irrigated, and if there is a doubt of sufficient moisture it is better to soak the land in the winter in any event.

Thinning the apricot should be considered as essential an operation as pruning, provided of course the fruit has set well. It does not pay to cut and seed small, undersized apricots, and the canners won't take them at any price. Thin the crop and thin well; by doing so you will make money on your apricot crop, while small fruit will hardly pay expenses.

It should not be necessary to allude to the handling of the soil. It goes without saying that this must be well done, or all other work and care is wasted. Of late years we have become lazy in the matter of cultivating the land, which is even more necessary after irrigating than if there were no irrigation.

Irrigation, if applied during the summer, should always be in deep furrows in which a sub-soiler has followed the plow. This gets the water to where it is needed and leaves little or no baked surface.

Diseases of the apricot are few. A good winter lime sulphur spray will generally help sufficiently to keep the trees healthy.

Citrus

and

Fruits

PRACTICAL FUMIGATION

Written for California Cultivator

By G. W. Waterbury

THE commercially profitable citrus tree of today is like a sensitive animal; it responds well to good care and attention and quickly represents improper treatment. Take a lemon tree for instance; a scratch across the trunk at certain times of the year may cause its death; too little or too much water breeds disease where fungus attacks destroy vitality; improper pruning causes a severe falling off of fruit, and scale always prevents a satisfactory set of fruit on any tree whose object is to produce fruit.

In Southern California citrus growers have been over 20 years fighting the different species of "armored" scale; the species familiarly known as the "black," "red," "yellow," "purple" scales. The cottony cushiony, the mealy bug and the red spider have also caused trouble from time to time in certain sections of the citrus belt.

In the central portion of the state, in the Porterville-Lindsay section, there was until recently an almost complete absence of insects injurious to citrus trees, and the only one worth mentioning was the thrips, which did some damage to the oranges through scarring. Then came the new addition to the color scheme of the scale family, coccus citricola, familiarly known as the "gray" scale. When the gray scale arrived the Sierra foothills knew that eradication was henceforth to be an annual affair over 45,000 acres of citrus lands.

There are certain facts that are now well established in regard to plant life in every section of the world, and the principal one is that wherever large plantings are made some species of injurious insects will eventually appear to subsist on either fruit or foliage, and a fact equally important to the grower is that whenever certain insects become well established they can never be wholly eradicated. By a certain expenditure of time, trouble and money, however, almost all of the predacious insects can be so restricted in numbers that their commercial damage is very slight. That is, the grower, whether he have apple, peach, prune, apricot, pear or citrus trees, can by expending so much money annually or biannually keep trees and fruit in a condition practically free from scale, even though complete eradication is not possible.

In all eradication work it is the proportion, the percentage of kill, that counts, and a variation of ten per cent, while a comparatively small proportion of the whole, means a great deal to the grower. This is due to the immense productivity of the scale family whose two missions in life consist in eating and breeding. The progeny of one female is sometimes immense, Prof. Quayle stating that one citrocicola can produce as many as 2000 young. It is numbers that do the damage and 100 on an orange tree would be little damage, while 30,000 would devitalize the tree and the 100 grow to 30,000 in a season or so if left to themselves.

In all deciduous trees spraying is the acceptable manner of control, and it is then a matter of sprays for effectual eradication. In citrus trees spraying is not the way to kill scale and never will be; it is not a question of what kind of sprays to use; it is a matter of physical impossibility. The deciduous trees are defoliated when spraying is done; the citrus trees are never defoliated and seldom properly pruned.

It is the physical character of the fruit trees where scale is to be killed that determines the mode of procedure, and it was the impossibility of properly penetrating a dense amount of foliage that first led to the use of hydrocyanic acid gas and fumigating tents. The gas penetrates everywhere about trunk, branches and leaves; the spray material does not in citrus trees.

In the southern citrus belt the principles of fumigation are now universally recognized, but in the Porterville district, where the scale is a new excitement, there is a tendency to start the scale killing processes all over again, even though experimentation is always costly work.

Up to the present time cyanogen gas is the only gas found effective for fumigating work. Mr. F. W. Braun told me he had tried many forms of gas, all more or less of a deadly poisonous nature, but always met with failure in killing scale. Owing to the nature of manufacturing cyanogen gas (it is a synthetic process), the cost per pound will always be high, although the fruit men can perhaps derive some satisfaction from the fact that the mining men pay from \$60.00 to \$100.00 a ton more than do the citrus growers.

Good fumigation, where the scale have not previously become too numerous, will last two years on oranges and from 12 to 18 months on lemon trees. The great bulk of the trees in the citrus belt are oranges, and the average cost of fumigating every other year is about 33 cents, or 16½ cents each year. The apple men spray at least an average of three times each year and at a cost of about six cents for each spraying, or 18 cents per year and 36 cents for every two years, against 33 cents for the citrus grower. It is principally because the amount is rendered every other year that the cost looms high.

If I had my choice between fertilizing and fumigating I would drop the fertilizing first if the money could not be had for both, and yet we know that both are important. An unfertilized tree will always dig up a certain amount of fertility from the soil, but a scaly tree will never set fruit in paying quantities. When the grove is badly infested there will be absolutely no fruit on the trees, and in the case of the red and purple scales the infested trees will be killed in time.

Fruit once covered with scale, or with the fungus resulting from the scale, can never be made attractive. If severe washing is given the fruit will not ship without heavy decay and if too badly injured is fit only for the lower grades or the cull box. Such losses soon run up into the hundreds of dollars.

The practical fumigator, the acid and cyanide people, are not so much interested in when the work is done as is the grower. They know the work must be done some time, and if they are in business to stay it matters little whether the work is done this year or next or if the grower lets his grove go a year too long and spreads the infestation more generally about the community. A very dirty grove is likely to call for successive fumigations while if the work is done regularly every other year the tree remains practically clean and the fumigation work lasts longer. Having an infested grove is against the law of California and the county horticultural commissioner should see that the law is enforced; he is allowed no discretion in the matter when complaint is made.

Government men, practical fumigators and Mr. Braun's house are working to improve the art, to lessen the liability to injury while yet keeping the dosage up to a full state of efficiency. The careful grower wants all the scale killed but no damage done to his leaves or fruit. Woglum gave us the marked tents, thus somewhat eliminating dosage chance. He did not give us, however, a sure and stable climate, where temperature, humidity, electrical influences, etc., all those intangible influences which resist accurate determination, can be carefully determined.

The fumigator of today, if he seeks to improve his profession, carries dosage charts, reliable thermometers and a psychrometer. Besides all these the foreman should be a man of experience and capable of judging carefully in regard to all matters under his control.

The fumigating machine marks another step forward in the art of fumigation, and if these machines will do the work there is no question but that the cyanide and sulphuric acid mixed in exact proportions for each tree in a machine where high temperatures are always present and where the gas goes out immediately at a maximum strength, will help secure more uniform results.

Prof. Quayle of the Riverside experiment station, assisted by Mr. de Ong, are now working on new dosage charts, and some early experimental work in collaboration with Mr. F. W. Custer of Corona are likely to be of both benefit and profit to the citrus grower when definite results are made known.

DATE CULTURE IN SOUTHERN ARIZONA

Answering an inquiry regarding date culture, Prof. R. H. Forbes, dean of the University of Arizona college of agriculture, replies:

"Date palms will endure any degree of cold experienced along the Colorado River. At the Tempe date orchard we have passed through a temperature of 14 degrees Fahrenheit, with a resulting loss of the green leaves of the palms, but without killing them. It is only fair to say, however, that while the new tops came out promptly, the trees were quite severely set back as a result of the loss of reserve materials needed for the restoration of the palms. At Yuma three years ago, at the time of the severe cold weather, the date palms were very little damaged.

"Date palms require comparatively little irrigating water but must never be allowed to dry out. With water at ten to 12 feet below the surface, the roots of the date palm will very quickly reach moist soil so that they

will be in little danger of suffering from want of water supply. Nevertheless, even if palms are in moist soil an occasional irrigation is advisable.

"We believe that certain desirable varieties of dates will prove of commercial profit when they can be brought to this country in sufficient number. At Tempe, for instance, the following varieties have been tested and found satisfactory for southern Arizona conditions: Birket el Haggi, now known as Hayani, Tadala, Tennessee, Khadvawi, Maktum, Kustawi, Behri, Nesheem, and Nazl el Bacca. According to conservative calculations a ten-acre orchard of Hayani palms containing 400 trees and yielding according to the average shown at the Tempe orchard should give a net profit of \$2000 a year with minimum of labor during the hot months of May, June, July and August.

"Date palms begin to produce suckers at about six years of age and keep on producing them until about

20 years of age. Different varieties vary in the number of suckers produced, but taking all varieties together an average of about 15 suckers to the palm is a fair estimate. At the prices paid for imported date suckers the offshoots produced in a growing orchard ought to be a very material source of profit, inasmuch as these suckers ordinarily cost, laid down in this country, not less than \$3.50 apiece, and with the importer's profits added, usually more than that.

"I have no doubt of the suitability of the Cibola Valley conditions for date culture inasmuch as we regard the Colorado Valley below Yuma the best place for experimental date culture we have thus far worked with. Climatic conditions also are favorable."

SURE CURE

Mike—What's th' best thing to drown one's sorrows in, Pat?

Pat—Perspiration! Hard work will kill them.

RELATION OF WASHING TO DECAY IN WASHINGTON NAVEL ORANGES

By C. W. Mann, Pomologist of the United States Department of Agriculture

During the past two or three years there has been a great increase in the washing of oranges in the packing houses of Southern California, and the indications are that a much larger proportion of the fruit will be subjected to this treatment in the future unless effective measures can be used for the control of scale and sooty mold in the orchards.

The results of the investigations of the bureau of plant industry have shown that washing, even under the most favorable conditions, is followed by an increase in the decay in the packed fruit. The process offers ideal conditions for the infection of injured fruits with blue mold, and where washing is employed a higher standard of care in the field and

(Continued on Page 155)

\$1,635,000 Hidden In This Year's Goodyear Tires

Not an Excuse

Let us first explain that this is not an excuse for over-price. Our this year's price reduction—made February 1—will save Goodyear users about five million dollars this year.

And that was our third reduction in two years, totaling 45 per cent. Our matchless output gives you in Goodyears a value never before known in tires.

Goodyear Extras

Goodyear Fortified Tires have five costly features found in no other tire. They combat your five major troubles in better ways than anyone else attempts.

These tires, in addition, have other features not commonly employed.

If we omitted those extras, this year's probable output would cost us \$1,635,000 less. That is, we could add to our profits about \$5450 per day.

Most of these extras are hidden. Tires that lack them look as strong

as Goodyears. And you would never know it, save by months of use, if we left them out.

\$500,000 Added

This year's improvements—just our latest additions—cost us \$500,000 yearly. Most of it goes into extra rubber—all into extra wear.

And this much is added—this half million dollars—at a time when we save users five million dollars in price. At a time when some makers are skimping to meet competition.

Then our Research Department—to find more betterments still—will cost us \$100,000.

Yours for the Asking

These extras are yours for the asking. Tires without them will be offered so long as you will buy them. But any dealer, if you ask him, will supply you Goodyear tires.

Goodyear has for years outsold any other tire. It is gaining new users faster than we can supply them. And those extras did it. (2418)

GOOD YEAR

AKRON, OHIO

Fortified Tires

Fortified Against

- Rim-Cuts—by our No-Rim-Cut feature.

STANDARDIZATION OF PACK

FROM the constitution and by-laws of the Watsonville Apple Distributors we give in full Article IV, Standardization of Pack.

The first or highest grade of apples to be packed by members of said Watsonville Apple Distributors, shall be known as "Standard," and all first or highest grade apples packed by or for any member of the said organization shall be put up according to the standard prescribed by the terms as what is known as the "Standard Apple Act of 1915," approved by the governor of the state of California on the eleventh day of June, 1915, and shall be stamped and graded as by the terms of said act provided. All other grades of apples packed by members of said organization shall be packed and

branded in accordance with the standards therefor that may be adopted by this board.

All of the apples packed by members of said organization shall be subject to inspection, both before and after packing, by inspectors appointed under the terms of said act, and by inspectors acting under authority of this board.

For the purpose of making such inspection, all inspectors so appointed or acting shall have the right at any time to enter into any place where apples are being kept, stored or transported by any member of said organization, and whenever it is deemed necessary by such inspectors packed boxes may be opened for the purpose of inspection.

When any apples belonging to any member of said organization shall be stored or held in the warehouse or in the possession of any other person, firm or corporation, the membership card in said organization signed by the owner of said apples, shall serve as a written order upon the party with whom such apples are stored or in whose possession they may be, to permit such inspectors to inspect the same as herein provided.

No apples shall be shipped or delivered for shipment or delivered to a purchaser thereof in packed boxes until the same shall have been inspected as herein required and found to be packed and branded in conformity with the standards herein referred to.

For the purpose of inspection and for the purpose of causing apples which have been inspected and have been found to be packed or branded in violation of any of the requirements hereunder, to be repacked or rebranded, the members of the board of control appointed by this board, or any one of them, shall at all times be entitled to the possession of all the apples packed or being packed by any member of this organization, upon demand.

At a recent meeting of the executive board of the Watsonville Apple Distributors three grades for apples packed by members of the organization were established, to be known and designated as "Standard," "Fancy" and "B" grade.

The "Standard" grade is to come under "The Standard Apple Act of 1915," and the apples packed in this grade can vary in size in any box not to exceed one-quarter of an inch. Apples packed in this grade must have the inspection of the state inspectors, and the packed box must have the stamp of the state of California thereon.

The "Fancy" grade is to be of the same quality of apples as the "Standard" grade in every respect except variation in size, which shall be as follows:

Four and one-half tier apples to vary in size from two and one-fourth to two and five-eighths inches.

Four tier apples to vary in size from two and five-eighths to three inches.

Three and one-half tier apples to include any apples more than three inches.

Apples packed in this grade must be inspected by the inspectors of the

Watsonville Apple Distributors, and the packed box must have the stamp of the association thereon.

The "B" grade will allow in the pack, caterpillar bitten apples, slightly misshapen apples, bruised apples where skin is not broken, and stemless apples. Wormy apples or apples infected with infectious diseases will not be permitted in this pack. A variation of not over three per cent of any one defect or a total of 12 per cent will be permitted. Apples packed in this grade must also be inspected by the inspectors of the Watsonville Apple Distributors and the packed box must have the stamp of the association thereon and marked "B" grade.

The three grades established may be packed in the so-called Northwestern or Standard box, or in the California box.

GRAVENSTEIN SHOW

The Sebastopol Apple Show is already far enough advanced in its arrangements to prove that a wonderful exhibit is to be made this year by King Gravenstein. The permanent apple show building has not yet been built but as heretofore a temporary pavilion will house the exhibits. Secretary Kelly writes that thousands of incandescent lights have already been arranged for illumination of the mammoth tent, and that in addition to the exhibit of Gravensteins there will be many other varieties of apples on the tables and as the show is at the home of the Luther Burbank experiment grounds there will be an extended exhibit of greatest interest.

On Gravenstein Day there will be distributed free to all 10,000 of the finest Gravensteins.

Of course there will be a great number of special features such as the Liberty Bell, living tower, fountains, merry-go-rounds, and others similar and yet different from those seen in former shows.

The following are the rules for judging:

One thousand points, made up of 600 points for perfect fruit, 100 for uniform size, 100 for color and 200 for perfect pack, will constitute a per-

WELL CASING

of superior merit—single and double—hard red steel, or galvanized—in all sizes. Ask for Catalogue 17.

We also manufacture the famous "American" Surface Irrigation Pipe, and Riveted Steel Pipe for underground use. Also all fittings for water systems, tanks, troughs, etc. Write for catalogues.

"The Farmers Friend"

Ask your Dealer

fect score. In judging the pack, 40 points will be allowed for bulge, 40 for alignment, 40 for height at ends, 40 for compactness and 40 for attractiveness and style.

For each wormy apple, 40 points will be deducted; for other imperfections for scab or scale, 8 points each. Deductions on pack, uniformity and color will be made in the discretion of the judges.

In judging boxed apples, owing to the unusual amount of scab, the judges will be guided by the same rules governing commercial packing houses, and making allowance for the scab. For lack of stems, no deduction will be made, except where skin of apple is broken.

No distinction will be made between three, three and one-half; four and four and one-half tier pack; but any entry will be scored against for want of uniformity, unless all of one pack, either three, three and one-half, four or four and one-half tier.

In the competition for sweepstakes prizes, no variety will be given any preference.

In judging 200 box lots, four boxes from each entry will be examined, of the 63 box lot three, of the 42 box lot two, and of the 14 and 7 box lots one each. In case of a tie in the score between two or more entries, additional boxes of each entry tied will be examined until the tie is broken. Should it be impossible to break the tie, the cash prize shall be divided among those tied and other prizes will be awarded by lot.

No score in any class will be announced until the judging of that class is completed.

In the judging of the dried fruit, by-products and features, 1000 will constitute a perfect score, and the board of judges will be guided by their own discretion in rating the several entries.

BIG CROP OF WALNUTS

The blight has done serious damage to the walnut crop and the big promise has been somewhat reduced, but in spite of that the coming crop will be large. Some weeks ago we quoted from letters of subscribers telling of immense clusters of nuts on the trees this year. That brought out reports from other orchardists who write of even larger clusters.

County Horticultural Commissioner Brock of Ventura County writes:

"In Bardsdale there is an old orchard in which one tree is noted for the bearing of its fruit in clusters, and in one cluster 26 nuts were found. Twenty-five were found in the cluster, and one had been broken off. This was on exhibit at Fillmore a few days after it was collected."

John T. Culbertson, horticultural inspector at Fillmore, Ventura County, writes: "Seeing your article of May 6, telling of the cluster of eight walnuts upon a single twig, I thought you might be interested to hear of some in our section.

"Mr. G. L. Armstrong, a thoroughly wide-awake walnut grower of Fillmore, cut from one of his Santa Barbara soft shell trees, a cluster of 25 well formed nuts of uniform size. It is not unusual to see as many as 14 in a cluster upon his trees.

"The present indications point to an enormous crop this season for this section. It is, however, difficult to say what per cent of the young nuts which have set will be injured by the blight.

"I cut a cluster of 12 paper shell walnuts from a tree in Mr. E. Ritzman's grove near Fillmore."

Mrs. Fred A. Rollins of Chino

writes: "In looking over last week's paper I see records of walnut trees, and as I have just a little better send the record. Have many with five to nine in cluster and ten and twelve, and one of fourteen, all in perfect clusters. This is on the Rollins ranch northeast of Chino on eight-year-old trees."

DRIED APRICOTS

Written for California Cultivator
By J. G. Berneike

The bulk of dried apricots has already passed into the packers' hands. The output was smaller than the crop estimate because much good fruit went to waste and poor fruit was discarded for fear it would not pay drying expenses.

While this statement is made regarding Orange County it applies probably with equal force to the whole state. Our Orange County fruit was generally good and the quality of the dried fruit is admitted to be good. In spite of this fact growers have received only from less than five cents to a trifle about six and one-half cents.

A small number of growers are holding for seven to eight cents per pound; one of these refused an offer of six and three-fourths cents. Pits have brought our growers from \$16.00 or less per ton up to \$23.25. But for the war they would have brought from \$30.00 to \$35.00 this year. Since only the grower who has a full crop breaks even on seven cents per pound for dried 'cots, and every grower with a light crop fails to pay expenses, it follows that practically every apricot grower in the state is a loser this year. Yet these apricots, bought at five to seven cents, will retail at 18 to 35 cents per pound, and some people still tell us that our marketing system is the best possible.

When the liberty bell rang out its peals for political freedom some larger bells were dumb. When the smaller growers voice their revolutionary ideas concerning economic betterment, some larger intellects tell them to hush. But the change is coming. We know how to raise apricots; what we need to know is how to get our pay for them after we have raised them.

PLANT LICE ABUNDANT

This season plant lice or aphids on trees and shrubs are more abundant than in many years. Weather conditions have been very favorable for their reproduction and very unfavorable for the reproduction of their parasitic enemies. Many of the aphids in normal years attracted very little attention. In normal years artificial methods of control must be used to keep them within bounds.

"In our experience at the Minnesota experiment station," says A. G. Ruggles of the division of entomology, "the extract of tobacco containing 40 per cent nicotine in the form of nicotine sulfate has been very effective. This material is on the market. One half-pint of this in 50 gallons of water is very effective if sprayed on the plant in such a way that every insect is touched with a small particle of the spray. This material is even more effective if mixed with whale oil soap—one pound of whale oil soap to ten gallons of the diluted nicotine solution."

An old colored woman boarded a street car and proffered the conductor five pennies for her fare. "I can't use them," he said gruffly. "Dat's all right, honey," she replied. "Jes' you give 'em to the company. They kin use 'em.—The Delineator.

FERTILIZE WITH AIR

by inoculating your soil with FARMOGERM. The nitrogen gathering bacteria will make money for you by placing large quantities of nitrogen in the soil and on the roots of your legume plants. Farmogerm will cut your fertilizer costs. Use it this year and get "Bigger Crops," "Richer Soil" and greater profit.

The Standard Inoculation

FARMOGERM

High-Bred Nitrogen Gathering Bacteria

is a moist, jelly-like substance, containing billions of nitrogen-gathering bacteria. It is put up in a patent bottle which keeps the jelly (containing bacteria food) moist at all times. Bacteria cannot live long in cotton wads, granular media, or in any other dry state. The nitrogen-gathering bacteria live for years in the moist jelly-like media of FARMOGERM.

Results Guaranteed

Prices: 1 Acre, \$2.00; 5 Acres, \$6.00; 50 Acres, \$55.00. Our inoculation experts will gladly give detailed information regarding inoculation with FARMOGERM. Write for interesting 32-page book—FREE.

VALUE OF TREES

Written for California Cultivator
By Ernest Branton

HERE is so great diversity of opinion regarding the value of street and highway trees that it is interesting to watch court proceedings regarding the same. Some years ago a local horticultural commissioner who was a very poor judge of values of ornamentals, and had a very meager knowledge of them, testified in a street-widening case that a specimen of Pircunia was worth \$600 when \$100, or even \$50, would have been a liberal estimate for this quick-growing and comparatively worthless tree, worthless largely because its pithy substance may scarcely be called wood.

Now comes a very interesting court case, not yet decided, on trial at Bridgewater, Massachusetts, where 17 old and stately shade trees have been killed by gas leaking from faulty main

which cities may pass ordinances of sufficient control.

Rural Homes

California has nearly the whole world to draw upon for her ornamental plant life, and variety is not wanting. It holds good, then, that we should have gardens second to none in respect to quality and diversity of vegetation.

In the city conditions are hard for many tender plants, but out in the free air of the country all should find congenial atmosphere and surroundings if the plants are those suited to local climatic and soil conditions. Bear in mind that no section of the United States may grow semi-tropic plants except California, and then plant such class of vegetation. Do not plant what may be seen in all other states or you show a lamentable lack of appreciation of nature's most bounteous gift to the Golden State.

Lessons from Neglect

In the country may usually be found more striking examples of neglected trees and shrubs than in the city, for

CLASSIC PERGOLA

pipes. Suit has been brought by owners of abutting property, and in cases they have demanded as much as \$1,000 per tree. The gas company has confessed liability and conceded the value of trees to the extent of offering to remove the dead trees, plant others in their places and pay a substantial cash bonus for each tree killed—all of which is very pleasing to every lover of trees. But the local warden, acting as a sort of buffer between the contending parties, says the trees are worth much more than the sum offered and, what is still more significant, that the loss of large, healthy shade trees decreases the value of property at least 20 per cent.

This expert opinion is especially gratifying to all who have worked long and faithfully to protect the umbrageous ornaments that align our streets and highways and to encourage the planting of more. Such legal action marks the "march of progress" in a most substantial way and in a very pleasing direction. This is a legal controversy which has not yet arisen in California and will not arise until we manifest a deeper interest and wider appreciation of tree values. Now that a few cities control all street planting activities and still fewer counties have assumed a like legal control, we are on the march toward higher ideals, yet still far from the goal of protection and safety to public trees. We sadly need better state laws regarding county forestry commissions and an enabling act through

houses in the city are usually abandoned only to make room for improvements, and thus the surrounding vegetation is soon destroyed. In rural districts new sites for the home are chosen, adjoining properties are added to one containing a fine house, and in many ways unconscious provision is made for submitting plant life to severe tests. In such places may be found valuable lessons for all who seek lists of plants for California gardens, that may be depended upon to thrive with a minimum of care and are therefore best suited to local conditions. Do not pass these neglected gardens by without learning something of value from them.

Value of Acacias

As one goes spinning along our great highways he cannot fail to note that next to the pepper tree, aside from the dual purpose eucalypt, come the acacias as dominant features of the landscape and home surroundings. Like the two others mentioned the acacias are extremely tough and hardy trees. Seldom is one seen in ill health or suffering from lack of care, food or water (the two latter terms being practically synonymous). They have flowers far surpassing in attractiveness those of most other trees because of their wholly sufficient number, there being no other tree that may be said to bear a solid mass of blossoms. As they are nearly

ON THE MARINA AT THE EXPOSITION JUST BEFORE THE ASCENT OF THE AVIATOR

EVENTS THIS WEEK

MANY of the meetings held this week have much interest for the farmer, perhaps more for the scientist and farm expert. Amongst other things the Society for the Promotion of Agricultural Science met on August 9 and 10. The American Society of Agronomists met on the same days. The American Society for the Advancement of Agricultural Teaching and the American Farm Management Association also have been holding their sessions. Another congress which concerns us all is that of the International Congress of Thrift. Another association holding its annual meeting is the American Economic Association, which will end its sessions Saturday evening. The Pacific Highway Association of North America ends its sessions today. Holding the remainder of the week at Berkeley and at the Exposition is the Association of American Agricultural Colleges and Experiment Stations. Beginning today and continuing the rest of the week the California Association of Nurserymen will hold one of its most important sessions, and in connection there will also be held the meetings of the Pacific Coast Association of Nurserymen. Beginning tomorrow, August 13, and continuing three days, the American Association of Farm Institute Workers convenes. August 17-20 inclusive the Society of American Florists and Ornamental Horticulturists meets. On the same date the Florists' Telegraph Delivery Association holds sessions. On August 18 the National Association of Supervisors and Inspectors of Rural Colleges; the California State Veterinary Medical Association, August 30 to September 3; Society for Horticultural Science, August 31; International Congress of Farm Women, August 31 to September 3; the American Veterinary Medical Association, August 30 to September 3; the American Pomological Society, September 1 to 3.

AMONGST POULTRYMEN

The annual egg-laying contest, under direct supervision of Prof. Quisenberry of Missouri, is attracting large numbers of poultry people. The birds

are on their good behavior and some are making remarkable records. On the door of each pen is the name of the owner, and records may be seen as to the performances of each pen. Prof. Quisenberry is now working for the great poultry exhibition which will be held November 18 to 28. Entries for these exhibits must be made not later than October 15. Poultry people should bear these dates in mind.

It is anticipated that this exhibition will bring together the greatest number of pure-bred poultry ever exhibited. Several eastern states are planning through their departments of agriculture to transport the birds without cost to the poultry owner. It is presumed that California poultry people will not see all of the medals and cash prizes go east of the Rockies. Hence a large number of coast exhibits will probably be made.

LIVESTOCK SHOW DATES

Exhibition dates which will be of interest to live stock people are: Horses, mules and asses, September 30 to October 13; cattle, beef and dairy, October 18 to November 1; sheep, goats and swine, November 3 to November 15; carlots of live stock, November 11 to November 14; poultry and pigeons, November 18 to November 28; dogs, cats and pet stock, November 29 to December 1; children's pets, December 1 to December 3.

Entries for these classes are as follows:

Group A, horses, mules and asses, September 1; group B, beef cattle, September 15; group C, dairy cattle, September 15; group D, sheep and goats, October 1; group E, swine, October 1; group F, poultry and pigeons, October 15; group G, dogs, October 25; group H, cats, October 25; group I, pet stock, October 25; group J, children's pets, November 15; carlots of cattle, sheep and swine, October 10.

In Barn No. 2 are housed the exhibits of swine made by the American Berkshire Association, as the only exhibit of pure bred swine at present on the exposition grounds. Other exhibits of swine will be installed shortly. In the corrals is shown a very important exhibit of utility beef animals in which high grade Herefords, Shorthorns and Aberdeen-Angus steers are contrasted with California "Natives" and Mexicans in order to show profitable and unprofitable type of beef producing animals. Besides these and also in the corrals are exhibits of sheep which are shown for the same purpose.

In the poultry building are shown utility exhibits almost exclusively, as the fancy will have its opportunity in the Poultry Show which will occur from November 18 to November 28.

Krogh Manufacturing Co.
MACHINERY HALL

The Egg Laying Contest is being conducted with 600 birds. There have been installed a considerable number of bantams of many varieties. There are now being installed a considerable number of pheasants of different varieties, while the Japanese long-tailed chickens and the Japanese bantams or Silkies continue to be the center of interest.

There is now installed an egg candling apparatus, and daily demonstrations will be given at 4:30 p. m. for the benefit of the visitors. Also there is now in operation an electric brooder which will be the subject of daily demonstrations.

In this same building are shown about 1,000 pigeons of different varieties; these will include the Parlor Tumblers and the high-flying Tumblers and Rollers, which will be on exhibition at stated hours; also a loft of young racing Homers now in training for long-distance races to be held this fall.

Time your visit to the exposition so as to be sure to get in one clear night. Occasionally the fog rolls over the San Francisco hills until less than half of the Tower of Jewels is visible. On such nights there are no fireworks—and those fireworks are worth seeing.

Parents too often fail to provide fun in the home where it is so much needed. Half an hour of merriment will blot out the remembrance of many a care and annoyance during the day.

General Agriculture

FETERITA

Written for California Cultivator
By John W. Gilmore

FETERITA is one of the newer crops introduced into this country from Sudan, Egypt, in 1906. It belongs to the Durra type of grain or non-saccharine sorghums and is consequently sometimes called Sudan Durra.

It has many qualities which render it suitable for conditions in California, prominent among which may be mentioned its earliness, its drouth resistance, its non-shattering qualities, and the fact that so far as our information goes it is not so liable to be destroyed by the birds as some of the other varieties of this crop. Its quality of earliness is especially advantageous because of our hot, dry summers in the interior valleys. If planted at the proper season it will come to maturity under proper culture methods before the moisture supply of the soil is exhausted by evaporation, whereas of some of the longer maturing varieties, like kafir, this is

not true. Its drouth resistant qualities render it well adapted to many of our foothill lands, especially where the topography is such that irrigation cannot be practiced. While it will mature on a minimum amount of moisture for such crops, yet it responds readily to irrigation, and its yield of both forage and grain is materially increased when one or two irrigations can be given.

Feterita does not shatter like some of the grain sorghums, especially during the earlier stages of its ripening. Its head is close and compact, and possibly for that reason it does not lose its seed, as is sometimes the case with other varieties of grain sorghums. While the grain is very useful for feed, being relished by most livestock, yet the birds do not seem to care for it, especially in its earlier stages of ripening as they do for other members of this type of plants.

Planting

All of the grain sorghums, and this one in particular, must not be planted until after all dangers from frost have

passed and until the ground has become sufficiently warm to give it the feeling of warmth, rather than coolness, when handled early in the morning. The seeds of this plant respond to about the same conditions as do beans. If they are planted during the earlier season when the ground is well supplied with moisture and is cold, the major portion of them is likely to rot, thus causing a poor stand or no stand at all.

On the other hand they should be planted as early as the conditions of temperature and moisture mentioned above will permit. If planting be delayed beyond the opportune time the ground will lose so much of its moisture before maturity that the harvest will be materially lessened. There is probably no crop upon which more thought should be exercised in planting than this one.

Feterita may be planted for two distinct purposes, namely, for grain or for forage. Under some circumstances, especially where the soil is strong and there is sufficient water supply, it may be planted for both forage and grain. If planted for grain, the land should be thoroughly and deeply prepared early in the spring and should be harrowed at frequent intervals to destroy all early germinating seeds and to render the surface of the soil in a good friable condition. The seed should be planted at the rate of from six to eight pounds per acre

in rows from 30 to 42 inches apart, the width depending somewhat upon the strength of the land, the moisture supply, and the kind of implement at hand for cultivating. The seed may be planted with several implements, including the corn or bean planter, or the regular grain drill. When planted with a regular grain drill usually a sufficient number of tubes are stopped in order to give the rows the proper distance apart. The plants should stand from six to eight inches apart in the row, or where the soil is deficient in moisture from 10 to 12 inches apart is not too far. The plant tillers freely and produces an abundance of leaves, and because of these conditions is a little likely to lodge if growth conditions should be good, especially in the latter part of its growth. The seed should be planted sufficiently deep to get them within contact of the moist soil in order that germination may be prompt and vigorous.

When planted for forage only, the seed is usually sown broadcast or drilled, as with grain, using under such circumstances from 28 to 35 pounds per acre. When planted in this manner the plant does not grow as large and stalky as when planted in drills, and as a general rule feeding usually begins as soon as the plants are two or three feet high. Under conditions of early feeding the plant will take on a second growth, and where the land is strong and moisture abundant, two or three cuttings of forage may be secured during the year. Some precaution, however, must be exercised toward the end of the growing season regarding the feeding of plants that have been stunted in their growth, owing to poor soil conditions or an unfavorable moisture supply. A few instances are on record where animals have been poisoned from cyanide formed in the plants under conditions unfavorable to growth. It is generally observed, however, that quite as much nutritive material may be produced per acre where the crop is drilled and cultivated as under circumstances of broadcasting, even though two crops per year are secured.

Cultivation

With this crop, as with many others, thorough preparation of the land before planting constitutes at least half of the cultivation necessary to bring the crop to maturity. During the growing period of the crop cultivation should be sufficiently frequent to insure weed destruction and the conservation of moisture in the soil. Cultivations for such purposes will be sufficiently frequent to keep the surface of the soil in good physical condition. Usually the earlier cultivations may be deeper than those in the latter part of the growing season. Deep cultivation in the latter part of a season is detrimental because it is likely to destroy many of the shallow roots occurring near the surface. Usually four or five cultivations are sufficient to keep the crop in good growing condition. As stated above, this crop is more often planted upon land which cannot be irrigated, but when water is at hand one or two irrigations may be given during the growing season. If only one irrigation can be given this should take place at the time the heads are appearing from the sheath.

Harvesting

When the crop is grown for forage as well as for grain, it is most advantageous to cut with a corn harvester and shock it in the field. Feterita has the characteristic of ripening its seed a little before the leaves and stems are mature, and consequently if the heads

Means More Explosions, More
Revolutions, More Power, Less Fuel

THE big, dominating feature of this Oakland "38" is its high-speed motor. "High-Speed Motor" applies entirely to the motor and not to the speed of the car. Light, quick power pulses that melt into a continuous flow—eliminate vibration and give you a store of power on tap for any speed of the car—creep at three miles an hour or go the limit. Quick "getaways"—hills, mud or sand—steady road running.

Instead of the explosion of terrific, racking force, as in ordinary four-cylinder motors, there are many more power impulses of less violence with no pause between—hence, no vibration. Greater velocity of fly-wheel balances power and reduces car strain. Minimum fuel consumption.

Four cylinders of a minimum number of parts—light weight—low upkeep. This type of motor is standard

equipment with the best European builders. It costs more to build. Each part is lighter and stronger.

The high-speed four-cylinder motor won all the money on the Indianapolis and Chicago Speedways.

Oakland standards of uncompromising quality. Delco electric starting, lighting and ignition; Oakland-Stewart vacuum gasoline feed.

Lots of room for five passengers.

The Oakland line is complete. Your dealer is now demonstrating this Model "38" and the new light six. Very shortly we will announce another master of its class, to be a large seven-passenger touring car.

High-Speed Motor

are sufficiently ripe for seed the stalks are still in good forage condition. If it is desired to thresh out the grain this may be done by presenting the tops of the bundles to the cylinder of a grain thresher, taking care that the motion of the cylinder does not jerk the bundle in. On the other hand the heads may be cut by hand from the bundles and threshed or fed separately. When cut for forage the proper time is indicated by the hard dough stage of the grain. When cut for grain the seeds should be thoroughly ripe. In many instances the heads are cut by hand while the crop is standing in the field and fed separately to livestock either threshed or unthreshed. The stalks are left in the field as pasture for both hogs and cattle, the hogs picking up the small heads that have been left, and the cattle making good use of the standing stalks. This is a very common practice also with other grain sorghums and is employed extensively in Imperial Valley.

This crop makes excellent silage when cut at the proper time as indicated above for forage. If allowed to get too ripe it may still be siloed to advantage by adding water to the material as it goes into the silo, or immediately afterwards.

Uses

Feterita compares favorably in composition with the other varieties of grain sorghums and is almost equal in that respect to corn. It is usually estimated that 100 pounds of feterita grain is equivalent to 90 pounds of corn. Feterita produced at Davis in 1914 analyzed as follows: Water, 11.35 per cent; protein, 9.49 per cent; fat, 2.12 per cent; carbohydrates, 74.21 per cent; crude fibre, 1.33 per cent; ash, 1.50 per cent.

This grain has been found adapted to feeding practically all classes of livestock, including poultry. When fed to hogs and horses it should be cracked in order to secure best results. In some instances the grain has been ground into meal and this made into bread and cakes as a human food, and has been pronounced satisfactory.

WASHING NAVEL ORANGES

(Continued from Page 149)

house-handling methods becomes imperative in order to reduce the chances of mechanical injuries in the fruit to a minimum. The packing of moist or wet fruit provides conditions that are very favorable for the development of decay in injured fruit.

During the orange-shipping season of 1914-15, an investigation was conducted by the bureau to determine the relation of handling to the occurrence of decay resulting from the methods used in the washing and subsequent drying of the fruit. The work was undertaken at the request of the Citrus Protective League and packing house experiments were made in ten different houses during the season.

Washing and Drying Experiments

The handling experiments were planned to make a direct comparison of fruit very carefully picked by the bureau men with the same kind of fruit handled under ordinary commercial conditions. The fruit was packed and held in the packing houses, and the percentages of decay in the various lots were determined by inspection at the end of two weeks. The different lots included carefully handled and commercially handled fruit washed in the ordinary machinery,

part of which was packed while still moist or wet and an equal amount of fruit which was thoroughly dried before packing. Part of the same fruit was packed without washing or brushing. Those experiments were designed to show the effect of the washing process on the keeping quality of the fruit and to furnish data indicating the percentages of the decay due to the wet or moist condition of the fruit at the time of packing.

The data show that the percentage of decay in carefully handled fruit was increased from 1.8 per cent in the unwashed fruit to 3.4 per cent in the washed and thoroughly dried fruit, and was increased to 3.9 per cent in washed fruit packed wet. In the ordinary commercially handled lots the average percentage of decay in the unwashed fruit was 8.3 per cent. Washing followed by thorough drying increased the decay to 11.4 per cent, and in the same fruit packed wet the average decay was 13.9 per cent. The difference in the percentages of decay developing in the wet and dry-packed fruit was considerably greater during the period of cloudy or wet weather early in the season. The figures given are the averages for the whole season.

Relation of Handling to Decay in Washed Fruit

The results indicate that the losses from decay resulting from packing im-

properly dried oranges are directly in proportion to the care exercised in the methods of handling. Fruit showing a high percentage of mechanical injuries develops the maximum amount of decay following washing without thorough drying. In the fruit that was picked with sufficient care to avoid serious injuries there was a comparatively small increase in the decay in the lots that were washed and not thoroughly dried before packing. It is probable that a greater difference in favor of very thorough drying would have been shown if more efficient methods of handling the specially dried lots had been available during the early part of the season.

Methods of Drying

By heating the air blast used in orange dryers the relative humidity of the air is lowered, which increases its capacity for absorbing the moisture on the surface of the fruit. Experiments were made to determine the time required to dry the fruit under different conditions of temperature and humidity. The humidity of the air was varied by the use of a heating apparatus and by passing the air through a compartment containing calcium chloride.

The most rapid evaporation of the moisture on the fruit took place with dry air at a temperature of 130 degrees Fahrenheit. The time varied from approximately 11 minutes with an air blast having a temperature of 55 degrees and a relative humidity of 70 per cent to about one minute with air at a temperature of 130 degrees and 14 per cent humidity. The use of calcium chloride in conditioning

the air has not yet been demonstrated to be as effective or practicable for this purpose as heat. The temperature of the fruit was not increased materially after two minutes in an air blast at a temperature of 130 degrees.

Experiments were conducted with two different types of dryers. In one of these the roller conveyor was used and the air blast was forced through narrow openings above the fruit which extended across the conveyor parallel to the rollers. The openings were formed by air nozzles about three inches wide, the air apertures being about one-quarter of an inch in width. In the other device a rope conveyor was used and the fruit passed through narrow trough-shaped runs, the air blast being forced on the fruit from the sides and bottom of the runs.

In the experiments conducted with the dryers it was found that infection with blue mold may be increased if the dusty air of the packing house is blown on the fruit in the air blast. In an efficient system of drying the cost of heating the air to a temperature of 130 degrees should not exceed one dollar per car of packed fruit.

This circular is issued in order to present the results of the investigations promptly at the close of the season's work. The cooperation of the citrus associations and particularly the Pomona Fruit Growers' Exchange was given to the bureau investigators throughout the work. In addition the California Fruit Growers' Exchange and the Citrus Protective League shared the expense of conducting the investigation with the bureau of plant industry.

"Every Day is Bargain Day" to the Man who Buys BUILDING MATERIAL from WHITING MEAD'S Big CATALOG! 1915 Edition is FREE to you - Saves 20% to 40%

\$15 to \$18 Front Doors \$10 Veneered Oak with Plate Glass

—A typical value from our Sash and Door Dept., finest quality veneered oak doors with plate glass panels at top. Secured by special purchases recently and not mentioned in our catalog. All standard sizes and styles. Write for further details.

Screen Doors 25% Off

—New screen doors, the overstock of a famous door factory, made of best selected sugar pine in standard stock sizes. These doors can be duplicated in any first class yard at 25% to 40% more.

Style No. 8, \$1.25

—This door usually sells for \$1.65. Made of clear sugar pine and fitted with black screen wire, like picture, at our price..... \$1.25

Style No. 9, \$1.40

—Made of sugar pine, with three lower panels and fitted with galvanized screen wire. A door that will stand lots of use; our price..... \$1.40

Odd Doors \$1 and \$1.25

—Inside doors of best sugar pine, 5 panel Colonial and 5 panel O. G., styles a big lot of them, in all sizes.

Oregon Pine \$10 to \$15

—Good new rough Oregon Pine lumber, all sizes, at \$10 to \$15 per thousand.

—Oregon Pine latb, 4 ft., new, \$2.50 per thousand.

—Best grade Slashed Grain Oregon Pine, sanded finish, \$37.50 per thousand. This makes a beautiful interior finish.

—These prices will give you an idea of how our lumber department can save you money. Send in your lists and let us give you our price delivered.

Paints \$1.50 Gal.

—You can buy paints cheaper from us than any other dealer in the West. We buy in large quantities at the lowest prices.

—Standard House and Floor Paints, \$1.50 per gal.

—Standard makes of varnishes at 25% off regular prices.

Everything in Paints, Wall Tints, Brushes, etc., at big savings to you.

Dutch Kalsomine 4 1/2c per lb.

Black Graphite Roof..... 50c

—per gal..... 85c

Standard Roof Paints—red, green, gray—per gal..... 50c

Shingle Stain, made from pure ground colors..... 50c

—per gal..... 50c

"Standard" Roofing Paper

—A splendid quality of roofing paper that most firms would sell 20 to 40 per cent higher. Each roll complete with necessary cement, nails, etc., ready to lay.

1-ply, double-sanded, per roll of 108 square feet..... \$1.15

2-ply, double-sanded, per roll of 108 square feet..... \$1.40

3-ply, double-sanded, per roll of 108 square feet..... \$1.65

1-ply, "King" smooth, per roll of 108 square feet..... \$1.25

2-ply, "King" smooth, per roll of 108 square feet..... \$1.50

3-ply, "King" smooth, per roll of 108 square feet..... \$1.75

—Send for free sample. Remember we ship direct to you.

SHOVELS!—At Wholesale Cost—SHOVELS!

—You may go a life time before you get such an opportunity again. These shovels are in A-1 order but have been slightly smoked by means of a fire while in transit.

—Every one in perfect working condition, all styles and sizes; note the prices:

Long Handle, Round Point Shovels, per doz. \$4.85 or 50c each

Long Handle, Square Point Shovels, per doz. \$4.85 or 50c each

D Handle, Round Point Shovels, per doz. \$4.15 or 50c each

D Handle, Square Point Shovels, per doz. \$4.15 or 50c each

Long Handle Spades, per dozen..... \$3.75 or 40c each

D Handle Spades, per dozen..... \$3.75 or 40c each

Long Handle Scoops, per dozen..... \$3.75 or 40c each

D Handle Scoops, per dozen..... \$3.50 or 40c each

Dana Freezers at Half

—A big lot of Dana freezers. Send in your order today. We've sold hundreds of them at these prices and have yet to hear a single complaint.

3-quart size, regular \$2.25, now..... \$1.00

4-quart size, regular \$2.50, now..... \$1.25

\$30 Wallboard for \$19

—The highest grade wallboard on the market; made of 3 layers of moisture-proof fibre, with asphaltum between each layer; or cream white fiber board.

—Cheaper and neater than plaster or lumber, and anyone can install it in one-quarter of the time. Per 1000 square feet..... \$19.00

This Special Steel Enamelled Bath Tub \$8

—One of the greatest bargains we ever offered! Made of best galvanized 24 gauge steel.

Outside is finished in a rich sky blue enamel with bronze trimmings and hardwood edge. Priced only \$8.

—Other larger sizes at \$8.50, \$9 and \$10.

Low Down Enamel Steel \$11.50

Toilet Combination..... \$11.50

Complete to floor—wonderful value.

Low Down Vitreous China \$15.50

Closet Combination..... \$15.50

Special value—worth \$22.50.

Big value in High Tank \$10.00

Toilet Combinations..... \$10.00

Complete to floor—a bargain.

Special Bankrupt Stock of Kitchen Sinks.

All sizes—up from..... \$1.00

Best Quality Porcelain Lavatories; every one guaranteed—\$10 down to..... \$3.75

—\$10 down to..... \$3.75

Entered at the Post Office at Los An-
geles, California, as Second-Class Matter.**Thursday, August 12, 1915****OUR ADVERTISERS RELIABLE**We guarantee our subscribers against
loss through dishonesty of any adver-
tiser in the Cultivator. We do not at-
tempt, however, to adjust trifling differ-
ences between subscribers and honest,
responsible advertisers, nor will we pay
the debts of honest bankrupts. Notice
of complaint must be sent us within 30
days from date of the transaction, and
the subscriber must have mentioned the
Cultivator when writing the advertiser.**SELLING RAISINS**President Madison of the Asso-
ciated Raisin Company announces the
largest sale of export raisins ever
made. A 3,000-ton order has been re-
ceived from England and is being fill-
ed. It is to be hoped that this general
order is merely a forerunner of large
shipments which will be made during
the next few months. This shipment
is made up almost entirely of loose
Muscatels. The order called for a
liberal portion of seedless raisins, but
as none are now available seeded
raisins were sent to give the English
people a taste of California seeded
stock.**FUMIGATORS AT SCHOOL**This is a week in which fumiga-
tors of the state are attending the
first school of fumigation. Pomona
has been honored by this session, and
the recitation rooms and laboratories
in her high school building are used
for the purposes of this school. In
addition practical field experiments
are being made at night with two
forms of fumigation machines and
with the original form of pot genera-
tor. Prof. Woodworth of the state
university is leading in the lectures
and laboratory work, but addresses
are also being made by practical field
workers in fumigation.Fumigation has been a factor in or-
chard work since 1887, or even earlier,
though it was '88 or '89 before it be-
came general in orchard work, but
in spite of this quarter century of field
work there are many questions yet to
be solved. The purpose of this
school is to take a material step in
the solution of the fumigation prob-
lem. Another week we will endeavor
to condense some of the lessons of
this five days school in a few columns
for the Cultivator.**MORE ORANGES**Discouraged sugar producers of
Louisiana are turning to some fruit in
lieu of sugar cane and thousands of
acres of oranges are being planted.
One orchard of 7500 acres is being set
out, and it is estimated that within the
next two years the output of oranges
from the extreme southern part of
Louisiana will be in excess of a mil-
lion boxes. With a 47-cent freight rate
from Louisiana and a 71-cent rate
from Florida, California with its \$1.15
rate must produce a better quality of
the best orange on earth.**BEET SUGAR**California this year planted
128,900 acres to sugar beets. This is
nearly 20,000 acres more than her
planting of last year. Her last year's
production of sugar was 169,000 tons.
Colorado still produces the greatest
tonnage of sugar beets, having planted
this year 171,000 acres. Her last year's
tonnage was 220,799. Michigan stands
third in beet sugar production, her
planting this year being 146,000 acres.
This is greater than California's acre-
age, but Michigan's production is much
lower per acre. Last year she secured
from 111,000 acres only 110,000 tons.
Utah comes fourth, with Idaho produc-
ing nearly the same amount.**CALIFORNIA OIL**California's lead as an oil pro-
ducer was increased during the year
1914. In that year she produced 2,000,-
000 barrels more oil than in the pre-
ceding year. The total for 1914 was
99,775,327 barrels. The next largest
producer was Oklahoma, some of
whose wells made record productions
during the past two years. In 1914
her wells yielded 73,621,724 barrels.
Pennsylvania, which was formerly the
great oil producer, is now giving only
about 8,000,000 barrels annually. In
fact, she is now led by Ohio, which
is producing eight and a half million
barrels annually. Texas leads both
of these states with 9,000,000 barrels.
California's oil has been a great fac-
tor in her wonderful growth during
the past few years.**CERTIFIED SPUDS**One step has been taken by the
potato growers of California which we
believe will mean much to the future
of the industry. It was discussed at
some length at the recent potato grow-
ers' convention held in conjunction
with the State Growers Convention at
Stanford University. The certification
is to be secured from the state horti-
cultural commissioner after the grower
has filed with him the proper creden-
tials. The seed must be selected care-
fully and when it is being grown cer-
tain notations must be made and rec-
ords kept. This will result ultimately
in a hardy strain of seed which should
improve the quality of California prod-
uctions, and quantity as well. The po-
tato growers have been slower than
producers of most other crops in tak-
ing this advance step in seed selec-
tion.**SPRAY EARLIER**There have been many requests
for information as to how to handle
peach blight and various insect and
fungous troubles of deciduous fruits.
It seems that these have come more
generally this year than in former
years. For this we can only pass along
the word to spray and spray more in-
telligently than in the past. The fact
that fruit of peaches is infested withlittle brown spots extending a short
way under the skin indicates no spray-
ing or improper spraying some months
before the fruit was set. For many
of these troubles spraying should be
done early in December or as soon as
the leaves drop and another spraying
with Bordeaux shortly before the
blossoming time in the spring. It is
not intended on this page to give spe-
cific directions, but we will say that
another issue of the Cultivator within
the next few weeks will give particular
attention to many of the pests which
confront the fruit grower and to the
best methods of handling.**SULPHUR a FERTILIZER**Professor Reimer of Oregon
College has been for some years mak-
ing a study of the use of sulphur as
a fertilizer and he claims that care-
ful observation has shown that the
benefit from the application of super-
phosphates has come more from the
sulphur content in the sulphuric acid
used in making available the plant
food of the phosphate rock than from
the phosphoric acid. This was proven
out by the use of a form of phosphate
which was entirely available, at the
same time using a sulphate which
yielded its sulphur to the plant,
and in every case it was found that
the sulphate gave better returns.
Later experiments were made by ap-
plication of crude ground sulphur, and
the check plots showed remarkably
satisfactory results. It has been
known for some years that sulphur
was a necessary ingredient of nearly
all plant life, but it has been taken
for granted that it was supplied in
sufficient quantity in all soils. If re-
sults obtained by Prof. Reimer are
confirmed by other experiments it
may be that we will all soon be making
applications of crude sulphur or using
a complete fertilizer in which sulphur
is an ingredient.**COMPETING WITH OURSELVES**"The growers themselves are
one of the worst elements that have
worked to demoralize the peach mar-
ket. They have brought about the
present condition by establishing co-
operative sales agencies that do not
control the product nor have any re-
striction as to the price at which the
goods are to be sold."In the first place, these cooperative
agencies have no fixed cost price. In
the second place, they have no money
invested, and their only object is to
sell and sell."The above is from the remarks made
by President Madison of the Asso-
ciated Raisin Company. It is unfor-
tunate, but true nevertheless, that
fruit growers are engaged in com-
petition with each other, and this in
a larger way is true of individual co-
operative associations. Cooperative
effort is made to secure fair treat-
ment for the producer. Neighboring
cooperators enter the field with no
idea of cooperating with each other
and consequently there is almost cer-
tain conflict and loss. A suggestion
was presented some months ago in
these columns by Mr. Campbell of a
large Tulare County cooperative asso-
ciation that cooperators work to-
gether in the disposal of their crops.
In other words, we need a large clear-
ing house which shall aid the vari-
ous cooperating associations to work
in harmony instead of tearing each
other down. Whether the new federa-
tion of state associations will aid in
this we do not know, but we believe
that organization will be a step in
that direction. If it is not—or in any
case—cooperators should think seri-
ously along the line of making their
cooperation more effective.**Agricultural Notes**The dairy production of the prov-
ince of Alberta, Canada, is valued
at \$10,500,000.There are still a few wild buffalo
left on the continent; a herd of 400 to
500 is reported in the northern part of
Alberta, Canada.The 18,000 regularly established
libraries in the United States contain
more than 75,000,000 volumes, or an
increase of 20,000,000 since 1908.The United States bureau of fish-
eries last month forwarded to Kobe,
Japan, a shipment of 100,000 eggs of
the rainbow trout from its hatchery
in California.A large list of foreign countries have
signified their intention of making
exhibits at the International Dry Farm-
ing Congress and Soil Products Exposi-
tion to be held in Denver, September
26 to October 10.Inspectors of the Growers' League
of the Pacific Northwest estimate the
apple crop at 78 to 80 per cent of last
year's abnormally large yield. Wine-
saps are reported as bearing more ev-
enly than any other variety.England has authorized the sale to
United States buyers of uncombed
wool brought from Australia. This
wool is to be processed in the United
States because of lack of labor in
England and is to be returned to Eng-
land in the form of tops and yarns.The Liberty bell, which was sent
from Philadelphia to the San Fran-
cisco exhibition, made the journey in
a car specially designed and equip-
ped. It was a steel gondola car equip-
ped with specially designed springs
and festooned with electric lights
which brilliantly illuminated the bell
at night.The recent Fruit Growers' Conven-
tion of the provinces of British Col-
umbia and Alberta in Canada, after
a full investigation of methods of dis-
tributing British Columbia fruit unan-
imously indorsed a resolution rec-
ommending the dominion parliament
to appoint a royal commission to in-
quire into the fruit distribution and
marketing methods of Canada. The
movement is regarded as most
radical.A society called "Junta Agricola
Industrial" has been organized in
Port Limon, Costa Rica, to encourage
agricultural industries. Its first ef-
forts will be to furnish free of cost to
all planters and farmers all kinds of
seeds of vegetables and grains that
will grow in that climate. The ef-
fort is to build up new industries to
take the place of the banana indus-
try, which is being killed by the bana-
na disease.Potato growers of Russia are inter-
esting themselves in potato drying
mills. Since the action of their gov-
ernment in curtailing the manufacture
of alcoholic drinks the growers are
forced to find a new outlet for their
potatoes. Germany makes extensive
use of dried potato products, in flour
and for stock feed. About 500 potato
drying mills have been established in
Germany during the last ten years,
their number since 1904 having grown
80 per cent.Banana production is the best estab-
lished industry on the Atlantic Coast
of Nicaragua. In 1914, 1,911,000 bunches
were shipped. This year banana
disease and commercial depression
have created a very serious sit-
uation for the small growers who
have given their entire attention to
this one crop and they are forced
to pay high prices for American can-
ned goods and the necessities of life.

Agricultural News Notes

of the Pacific Coast

Northern California

Esparto's Almond Festival is to be held September 4.

The almond crop over the state is reported as being very light.

About 80 per cent of the rice milled at Gridley has been shipped to Porto Rico.

A number of Oroville peach growers are making refrigerator shipments of peaches to Chicago.

The Official Dairy Instructors' Association convention met in San Francisco, Saturday, August 7.

Several successful experiments have been made in tea growing near Hayward, in Alameda County.

Sutter County peach growers are receiving a few offers of \$8 to \$12 per ton for their canning peaches.

Two thousand nine hundred and twenty-six autos were registered in the state during the month of July.

There is talk of turning the old Sperry flour mill at Marysville into a rice mill, to be managed by growers.

Santa Rosa grange is making big plans for the entertainment of the national grange at the time of the national convention.

Prune growers of Sutter County report an unusually heavy demand for the dried fruit. First shipments will be made within the week.

Farmers of Humboldt County, through their farm bureau, recently purchased 300 tons of alfalfa from one ranch at Dixon, Solano County.

Answering the question as to why they took short courses at the university last fall, 24 per cent stated that it was because of newspaper articles.

The board of supervisors of Nevada County has decided to make an exhibition of fresh fruit in competition for prizes offered at the Panama Pacific exposition.

Santa Clara County prune growers are reported to be holding on to their 1915 crop until they are sure of good prices. They anticipate a good fall export trade to Europe.

Rice farmers at Richvale, Butte County, are planning to form a marketing pool. It is hoped also that Gridley and Biggs rice growers will join in this marketing effort.

Twenty carloads of Gravenstein apples were shipped from Sonoma County last week to South America. The apples go first by rail to New York, then by steamer to Buenos Ayres.

Salmon packers report that last year's output is all sold, much of it going to England and Australia. There has also been a 40 per cent gain in salmon sales to the west coast of South America.

Members of the rivers and and harbors committee of congress recently visited the Yuba and Sutter County district to acquaint themselves with conditions along the Sacramento and Feather Rivers.

The California Nurserymen's Association and the Pacific Coast Association of Nurserymen will convene at the Civic Auditorium, San Francisco, Thursday morning, August 12. Sessions will last until the 16th.

Central California

The Merced district fair will be held September 23-25.

Porterville has the largest Valencia crop in its history.

The cannery at Selma is running with a crew of 500.

San Joaquin Valley Day at the Panama Pacific is Saturday, August 14.

Oakdale, Stanislaus County, will hold a harvest festival, September 14-18.

Carload shipments of Thompson Seedless are being made from Sanger, Fresno County.

Merced County has just purchased \$100,000 worth of state road bonds to complete the lateral into Mariposa County.

Several carloads of watermelons will be sent to San Francisco for free distribution on San Joaquin Valley Day, August 14.

The yield of Turlock cantaloupes this year is estimated at 1000 cars. About 650 cars of watermelons will also be shipped.

A machine that looks something like a header is being operated on the Miller & Lux ranch near Los Banos to catch grasshoppers.

The California Associated Raisin Company is selling its "Sun Maid" raisins in cartons showing a girl's head set in the light of the rising sun.

A Porterville company has contracted with a New York firm to furnish \$50,000 worth of alfalfa hay. It will be shipped through the Panama canal.

Announcement has been made by the Fresno district fair association that \$380 will be awarded in prizes to women's clubs exhibiting at the 1915 fair.

A new citrus packing house is in course of construction at Sultana, Tulare County. It is being erected by the newly organized Northern Tulare County Citrus Association.

The Watsonville Apple Distributors have provided for a three-eighths inch variation in circumference of apples to be packed at Watsonville under the terms of the standard pack law.

The effort made in Kern County to form a cow-testing association has been dropped for the time being, as not enough members signed up by August 1, which was the final date set for securing membership.

The report of the county assessor of Stanislaus County shows that the acreage planted to wheat this year is four times last year's acreage. The report also shows an increase of over 13,000 cattle in the county in the same period.

An examination was recently held at Watsonville to secure inspectors to enforce the fruit standardization law which goes into effect on August 7. It is expected that about ten inspectors will be needed in Santa Cruz County to enforce the law.

Fruit growers of the Aromas district in San Benito County have formed an apple distributing association and expect to have a state inspector appointed soon to examine and stamp all boxes sent out of the state.

Southern California

Exhibits intended for the Ventura County fair must be entered by August 14.

A train of 25 carloads of cattle was shipped last week from Holtville to Kansas City.

Walnut growers of the Puente Valley of Los Angeles County expect a large crop of nuts.

One drying yard at Pomona, Los Angeles County, is drying apricots at the rate of 40 tons a day.

The eighth annual flower show of the Pasadena Horticultural Society has been set for October 28-30.

The chamber of commerce of Northern San Diego County will hold its next meeting at Julian August 11.

The farm bureau local at Saticoy in Ventura County is preparing a petition to secure a flood control district.

A school of fumigation was conducted at Pomona this week by Prof. Woodworth of the state university.

San Luis Obispo County has a horticultural commissioner. He is Carl Nichols, the first man to hold the position.

Peach growers in the district about Chino, San Bernardino County, have decided to organize a cooperative company and build a cannery at Chino.

Valencia growers of Covina are feeling very happy over the prices now being received. Much of the fruit is, however, being held for the September market.

The blackeye bean crop of the Yucaipa Valley of San Bernardino County is the largest yet grown in that county. The apple association will handle the bean crop of its members.

Twenty lima bean growers of the San Joaquin ranch in Orange County have appointed a committee to meet growers in Ventura County to discuss plans for securing better marketing conditions.

Approximately 20,000 acres is planted to cotton on the American side of the Imperial Valley. The first cotton is about ready for baling from the volunteer crop. There has been no trouble from aphids in the fields this season.

The Farm Bureau Swine Breeders' Association of Ventura County will exhibit a convenient hog panel fence, a dipping vat and an automatic feeder, and will hold a vaccination demonstration at the fair grounds at Ventura on Thursday, August 26.

The 62½-cent freight rate per 100 pounds on all canned goods to Chicago and intermediate points, which became effective July 21, is now extended to the Atlantic seaboard. This extension of the rate will probably take effect within six weeks.

The recently organized Simi Walnut Growers' Association of Ventura County will sell its nuts through the Moorpark packing house. Officers of the new association are: M. L. Montgomery, president; J. Roup, vice-president, and R. E. Harrington, secretary-treasurer. R. D. Lloyd and T. G. Bard were elected directors in the board of directors for the California Walnut Growers' Association.

The Coast

The sugar beet crop of Utah this year is unusually heavy.

Candied apples are becoming very popular in Puget Sound cities.

Oregon's apple crop is now estimated at about 75 per cent of average.

A serious plague of grasshoppers has been devastating the Uinta Valley of Utah.

The cutting of green wheat for silage is being practiced at Sprague, Washington.

Grasshoppers are doing much damage in the orchards of the Okanogan district of Washington.

Arizona now has 20 local farm improvement associations. The newest to be formed is at Gadsden.

A number of Indian allotments in the Colville Indian Reservation will be sold at Nespelem, Washington, on September 15.

All cooperative creameries and cheese factories in Southwestern Idaho have joined in the South Idaho Dairy Products Association.

A dairyman of Hillsdale, Oregon, was fined \$100 recently for trying to sell to butchers meat from a cow that had died of milk fever.

Pear growers of Kennewick, Washington, are handling the biggest crop of Bartlett's ever grown there. The crop is estimated at 25 carloads.

Poultrymen of Washington will hold a meeting during the Spokane Interstate Fair. The date has been set as September 15. Many practical lectures have been scheduled.

According to S. P. Huss, manager of the Alfalfa Seed Growers' Association of Yuma, Arizona, there are about 5000 acres of alfalfa in the Yuma Valley now being harvested for seed.

In cooperation with the state college at Pullman, Washington, the federal government will this year make extensive investigation into the cause of smut explosions which proved so serious in grain threshing machines last season.

E. F. Sanguinetti, a dairyman of the Yuma Valley of Arizona, has just completed a new dairy barn which is completely screened and so arranged that as the cows come into the barn they are sprayed with water or other solution to take off the flies.

Prof. Stanley F. Morse of the Arizona agricultural college is recommending that farmers put in more tepary beans as he has confidence that the war demand and increasing knowledge of the worth of the tepary bean will create a good market.

Cochise County, Arizona, has 10 local farm improvement associations. The supervisors of that county have just voted to appropriate \$1000 for the support of the adviser for the next year. Cochise and Santa Cruz Counties join in support of one adviser.

The agricultural extension service of the University of Arizona has just completed a very successful dairy campaign in the Yuma Valley. Feeding and housing problems were the principal subjects of discussion between the university men and the dairymen.

Live Stock and Dairy

DETERMINING FEEDING VALUES

THE McAlister ranch at Chino recently requested information regarding feeding values for dairy stock. Mr. McAlister wrote:

"Regarding percentage of digestible nutrients in different feeds, what is the correct standard to go by, Henry's 'Feeds and Feeding' or the United

States Bulletin No. 22? For instance, Henry gives beet pulp only 69 per cent of digestible nutrients and the United States bulletin gives 72.2 per cent.

"What is the best guide in determining the food value of a concentrate, the percentage of digestible nutrients or the experiments carried out at the different stations? For instance, beet

pulp which contains a much greater percentage of digestible nutrients than bran was found to be only two-thirds as valuable for dairy cows at the Wisconsin station. Cornmeal, which contains a much greater percentage of digestible nutrients than beet pulp, was not found to be any better for lambs at the Michigan station. According to these arguments, therefore, bran is 50 per cent more valuable than corn. Is this correct or are the experiments misleading?

"Is steam-dried beet pulp more valuable than fire-dried beet pulp?"

Mr. A. M. Goodman of the United States department of agriculture answers these questions as follows:

"We have your letter of July 17 and the series of questions from one of your subscribers. We have asked the division of publications to send you Farmers' Bulletin No. 346, which deals with the subject of the computation of rations based on energy values.

"Farmers' Bulletin No. 22 was published in 1901. The table in this publication, showing the amount of digestible nutrients in American feeding stuffs, was compiled from analysis made previous to that date. The last edition of Henry's 'Feeds and Feeding' was published in 1912, and the tables of feeding values represent the average of all analysis up to that later date.

"The analysis of feeding stuff is a lengthy and laborious task, and it would be indeed unusual for two independent investigators to obtain identical results. They agree so closely, however, that to adhere strictly to one standard or to another would produce no appreciable difference in results. The feeds vary greatly in chemical composition and digestibility; this fact makes it unnecessary to compound a certain ration conforming strictly to the mathematically balanced ration because we have no assurance that the analysis of the feeds used would correspond with the analysis indicated in our standard tables of composition of American feeding stuffs.

"The feeding value of any roughage or concentrate depends upon the nutrients they contain; the condition of these nutrients as regards digestibility; the character of the ration in which it is fed and the physiological influence which they exert upon the development and production of an animal. The percentages of digestible nutrients shown in Henry's 'Feeds and Feeding' are based on chemical analysis, a method which takes into consideration the first two factors named. The ultimate results of practical feeding experiments are influenced by complex actions within the animal which can not be provided in a laboratory. The data gathered by chemical analysis are the best we have, and they are important, especially as a starting point for further investigations, but they are nevertheless inadequate results from which to draw final conclusions in regard to values.

"Very extensive feeding experiments have been conducted in Scandinavian countries, covering a series of years. In these experiments attempts were made to compare the feeding value of different grains. A large number of cows, kept under farm conditions, were included in these experiments. These experiments, directly or indirectly, made a comparison of these feeds for feeding to dairy cattle, and it was found that it required about one and one-fourth pounds of bran to give the same results as one pound of dent corn. Similarly it was found that

it required about 1.2 pounds of dried beet pulp to equal the feeding value of one pound of corn. This is probably as close a relative value as can be supplied.

"No investigation has ever been conducted by this department to determine the comparative values of steam-dried and fire-dried beet pulp. In this country, however, beet pulp is dried exclusively with steam. Fire-dried beet pulp would, I imagine, be apt to contain a certain amount of soot, burned material and ash."

[In addition to the above we will give next week a letter just received from F. B. Morrison, co-author with W. A. Henry of Feeds and Feeding.—Ed.]

DAIRY SURVEY

A rough survey of the dairy section of the South San Joaquin irrigation district is to be made by the farm adviser of San Joaquin County in order to get a birdseye view of the dairy situation of that part of the county so that the assistance of the dairymen in this section can be carried out more effectively. A cow testing and dairymen's association will probably be organized. Almost all of the dairies are small, averaging around 15 cows, and it is not known yet whether these dairymen can be included in the present San Joaquin County Dairymen's Association or whether a separate auxiliary association will be formed. The work is to be carried out by Assistant Farm Adviser Carl J. Williams and will probably require a month's time.

The San Joaquin County Dairymen's Association now has over 1000 cows on test. The county hospital herd was recently added to the list by the board of supervisors.

CENSUS OF HOGS IN GLENN COUNTY

The farm bureau of Glenn County is making a census of the hog industry and of the dairy industry throughout the various farm centers. From the information collected live stock associations will be formed for the development and protection of these industries. Among other things these associations will undertake to aid the purchaser of pure bred stock, will combat and try to keep out various contagious diseases, will interest itself in the interchange of live stock, the formation of cow testing associations, and in the marketing of live stock products. The movement in the county is receiving the support of the farmers.

VERMONT GUERNSEY MAKES RECORD

The American Guernsey Cattle Club sends out the record of the Guernsey cow, Novice Masher, bred and owned by E. R. Andrews of Putney, Vermont, which has recently completed a very noteworthy record. As a two and a half year old she was put on test in 1912, and made in the following year 7813.60 pounds of milk and 392.39 pounds of butter fat. She was tested again when she freshened in May, 1914, and during the following year she produced 13,649 pounds of milk and 706.97 pounds of butter fat, as a three and a half year old, carrying a calf seven months. Her highest production was made in the month of December, when she produced 67.19 pounds butter fat, and her lowest month's production was 54.15 pounds of butter fat, thus showing the persistency with which she completed her record.

Novice Masher 33365, A. R. 2609, was sired by Triple Champion 13067,

A. R., who has seven A. R. daughters and several more are now under test. Her dam, Novice 3d, 23057, was purchased from the James M. Codman herd of Brookline, Massachusetts, and traces back to one of the earliest imported animals. Novice 3d's sire was Glen Masher 8812, A. R. He was also bred by James M. Codman and has two daughters in the Advanced Register whose records are 503.86 and 476.95 pounds of butter fat, respectively.

Novice Masher 33356, A. R. 2609, is the second daughter of Triple Champion 13067, A. R., to produce over 700 pounds of butter fat.

A WISE BANKER

In Ward County, North Dakota, is a banker who has shown true philanthropy and wisdom. He bought a carload of pure bred gilts and distributed them among the boys in the county who promised to care for them according to the advice of County Agent W. A. Peck. In the fall the boys could buy the sows at their actual cost, or they were to give the sows back to the banker, but they could keep the increase. Some of the boys bought their sows and those who did not had the pigs as their own. The banker bred such sows as were returned to him and again put them out with boys in the county.

In this way the boys learned how to handle pure bred stock, and were shown the superiority of blood and proper care. They came in personal touch with the county agent who was able to teach them much more than pig feeding. They got a substantial reward for their work, and a start that will mean much in the future.

The banker did a most excellent thing for the boys and for the county. The boys are the future farmers—and will have money to deposit in his bank, we hope. Is there not a suggestion in this for many a banker or successful business man who takes pride in his county? And may not a wise father get a hint that will keep his boys on the farm?—Successful Farming.

THE WAR HORSES

Nothing more strikingly proves that this is the age of gasoline and the motor car than the present European war. While millions of horses are being sent to the various armies in the field to become cannon fodder within ten days or a fortnight at the most, the fact remains that never was there a war where the horse was less prominent. I remember having seen the tribute of Gen. Robert E. Lee to the noble animals which played such an important part in our civil war. It ran like this: "There is many a war horse that is more entitled to immortality than the man that rides him." There spoke the true lover of horseflesh, a gallant gentleman whose grey charger was a conspicuous mark on many a battle field and bore his rider through many a fearful day and fray. Will the present war produce any horses as immortal as the mounts of Lee and Sherman, of Wellington and Napoleon? I doubt it very much.

You must not think for a minute that the horse is not figuring in the present war. He is on a very large scale. I have seen it stated that in the first seven months of the present war 3,000,000 head were used. For the complete mobilization of its army the German government required 800,000 horses. The French cavalry alone required a quarter of a million horses. For the British army in France and Belgium over 200,000 horses were transported across the channel. For the cavalry, artillery, and for transport service because of the lack of railways, Russia is using no less than a million horses. Austria put 250,000 into the field, while Turkey, Belgium and Serbia have contributed large numbers. Hence we cannot for a minute say that the

horse is not playing an important part in the present war. Yet it is a fact that the great bulk of the soldiers are being rushed into action or transported from one part of the battleground to another by railroad trains and motor cars, trucks, cabs, cars and even taxis being used to an extent undreamed of before the war broke out.

It is almost a foregone conclusion therefore that when commanding officers tear into action in taxicabs or lorries, no horse will win the immortality which General Lee conferred upon those of 50 years ago. History gives us many war horses which have won immortality. Let me outline you a brief list:

Wellington rode "Copenhagen" at Waterloo for 18 hours. This brave horse was buried with military honors. A simple marble tombstone says:

Here lies Copenhagen, the charger ridden by the duke of Wellington the entire day of the battle of Waterloo. Born 1808; died 1836.

God's humbler instrument of meaner clay.

Should share the glory of that glorious day.

Napoleon's "Marengo" lived for 36 years and was wounded seven times in the battle of Mont St. Jean.

Grant rode six horses, the most valuable being "Cincinnatus," for which he was offered \$10,000. This was the horse that Lincoln rode when he visited Grant at City Point just before the close of the war. "Cincinnatus" lived for nine years following the close of the war.

Gen. Robert E. Lee's "Traveler" was born in 1857 and came into Lee's possession seven years later. "Traveler" lived years after Lee, the horse dying in 1872.

"Sam" came into possession of Sherman at Shiloh and marched with Sherman on his way back from Vicksburg to Washington, via Atlanta, Savannah, Columbia and Richmond. Sheridan's "Rienzi" was presented him in 1862 and carried the brilliant general "From Winchester—twenty miles away." "Rienzi" lived until 13 years after the close of the war.

Practically every great general of our former wars had mounts shot from under them, but today the commanding officers are put afoot more often by punctured tires than by wounded war horses. The horses which the farmers of the grain belt are selling to the fighting nations in such large numbers are going across seas to be mere drudges and to fall before shot and shell within a fortnight on the average. They haul heavy cannon into action, bring up the commissary department and perform the menial work of war. Few of them will participate in charges like that of the gallant 600 at Balakava or when Sheridan rode from Winchester. They are playing a part in the war but the glamour of their role has been taken away. After all, what glamour or romance is there left in war in any of the various forms? Soldiers fighting hip-deep in water trenches, shot at by cannon ten or 20 miles away, dying without ever seeing the enemy, what glamour is there in this? Perhaps the awfulness of war, as it is being waged now, will mean the dawn, that much sooner, of the day of which the poet sang:

Till the war-drum throbbed no longer and the battle flags were furled,

In the Parliament of Man, the Federation of the World.—James M. Pierce in Farmer & Stockman.

A prospective buyer is more apt to come to a place where the entire community—or a goodly portion of it—specializes in the breed in which he is interested, than to one where there is only one breeder of that particular breed. His chances of getting what he wants are greater where there are a number of herds in the community than where there is only one.

—Increases the Milk Flow Strengthens & Improves the Physical Condition of the Cow—

That's what A. W. Morris & Sons (breeders of the new world's champion milk producer, Tilly Alcatra) say about Dried Beet Pulp.

Read this letter:—

Woodland, Cal., May 13, 1915.

"The Larowe Milling Co.,

Gentlemen:—

Having fed Dried Beet Pulp for the past four years in the official testing of our herd of registered Holstein-Friesian cattle we feel that we are in position to judge of its value as a dairy feed. We can now say without hesitancy that it is one of the best and most economical dairy feeds in the market, and for the dairyman in the alfalfa districts it is invaluable as a supplement to alfalfa.

Dried Beet Pulp fed with alfalfa will not only increase milk production, but it will materially strengthen and improve the physical condition of the cow, which enables her to maintain this milk flow, produce better offspring, and prolongs her period of usefulness. In feeding for maximum production we find Beet Pulp quite a necessity, as it has the effect to lighten the ration and tends to offset any injury which might arise from heavy feeding. We also find it valuable for growing calves.

(Signed) A. W. MORRIS & SONS CORPORATION
By F. L. Morris."

IF YOU are in doubt about the value of Larowe's Dried Beet Pulp for feeding to your cattle, we suggest that you get a single 100-lb. sack from your dealer and test it on one cow whose milk record you know. It may be had either plain or with molasses. Ask your dealer for LAROWE'S.

Books

This list is prepared with the purpose of enabling our Cultivator readers to supply themselves with standard books at lowest possible prices. We call especial attention to a few of the new publications. "Citrus Fruits" by Professor Coit, of the University of California, covers all phases of the Citrus Industry under California conditions—the kind of a book we have had many calls for but never before been able to supply. "Productive Feeding of Farm Animals" by Woll, will command special attention. "Poultry for Profit" (The Cultivator Poultry Book) by Koethen, another California book, is new and excellent, telling what to do and what not to do with poultry in California; a sure guide to poultry success. The new Standard Cyclopaedia of Horticulture, by Bailey, is not equalled by anything of the kind which has ever been published at any time in any language. Special terms of payment and discounts are offered by the publishers through us on this Cyclopaedia. Write us about it.

SWINE BREEDERS' EXHIBIT

The Ventura County Farm Bureau Swine Breeders' Association will exhibit a convenient hog panel fence, a dipping vat, an automatic feeder, and will hold a vaccination demonstration at the fair grounds, on Thursday, August 26, at 10 a. m. Dr. Cady of the United States department of agriculture and University of California, Dr. J. J. Streets, Dr. De Serpa and W. B. Parker, under the auspices of the Farm Bureau Swine Breeders' Association will demonstrate the use of the serum and virus as a preventive of hog cholera. The demonstration will be held at the Swine Breeders' Association exhibit. This demonstration will be of special interest to swine breeders.

PRONUNCIATION OF HOLSTEIN

"What breed of cattle did you say you were keeping?"

This question was put to me by the head of the dairy department of an agricultural college. "Holsteens," I said, sort of hesitating. I remembered that in German where the vowels ei came together the "e" was dropped and the "i" pronounced. I had heard it pronounced "Holsteens" so much that I believed usage established pronunciation. The professor kindly corrected my pronunciation, calling attention to the above rule. In the word Friesland, the "e" follows the "i" and is pronounced as is the German practice. I have even heard the word pronounced Holly-steen. Although a great many breeders seek to Americanize the pronunciation, by inquiry among leading men of the breed, I find that the pronunciation of "ei" as "i" in mine is the approved and correct one.—W. J. in Rural New Yorker.

CARE OF THE BULL

It is never safe policy to allow the bull to run at liberty in the pasture, either with the cows or by himself. It is necessary that he be given ample room for exercise, but this can always be supplied in the form of an especially constructed paddock designed for the purpose. Aside from the fact that a loose bull is always a potent source of danger, the promiscuous breeding which occurs when the bull runs with the other stock is to be condemned. The bull should always be handled with kindness and firmness and never given an opportunity to become acquainted with his enormous strength and destroying ability.

Every cow stable should have a system of ventilation to keep the air fresh and pure and the cows comfortable without exposing them to injurious drafts. If the smell in the barn is disagreeable at any time it indicates that the ventilation is deficient. At least 500 cubic feet of air space should be provided for each cow. The feed room, silo chute and hay chute should be conveniently located, but at the same time they should be in a separate room to keep the odor and dust out of the stable as much as possible.

The water tank or trough should be so convenient to the stable that it is unnecessary to expose the cows to extreme cold or severe storms. It should be kept clean and filled with an abundance of fresh, pure water to remove any doubt as to the ability of each animal to satisfy its thirst.

Higher quality animals are larger and more economic producers in their various lines; at the same time they sell for more than do animals of lesser quality.

Veterinary Queries

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Shetland Pony

Will you kindly advise through the Cultivator what to do for Shetland pony that scratches and rubs himself a great deal, mostly in summer months? Sometimes gnaws himself until he almost takes the hide off. Eyes also bother some. Have tried external treatments but to no effect.—Subscriber, El Dorado Springs.

Shetland ponies are not so susceptible to skin diseases or any disease as other animals. They come from a cold climate and where the humidity is very great so their hair grows very thick. In this dry climate they do not shed their hair freely and it is very irritating on a warm dry. We would advise clipping and scrubbing him all over with warm water and soap, then rinsing with clear water. It will also do him good to give a teaspoon of epsom salts in the feed once or twice a day.

More Skin Troubles

What can I do for a mare that seems to have some kind of itch? She has small lumps under the skin and the hair is coming off over them. When we take off the harness after working her she bites herself. She is fed alfalfa and oat hay and plenty of good pasture. Also feed rolled oats and condition powders but so far nothing helps her.—Subscriber, Es-

parto. Skin troubles are always more noticeable and annoying in summer than in cold weather. Most skin troubles are caused by mites or lice and can be relieved by external treatment, but when pimples or ulcers appear one must acknowledge that the trouble is from within.

First by thoroughly emptying the bowels and then giving something to thin the blood relief is usually given. Give a physic of aloin two drams, turpentine two ounces and raw linseed oil one pint. Mix and give at one dose. After this give a handful of epsom salts in the feed once a day. If this does not relieve in two weeks try giving one ounce of Fowler's solution of arsenic once a day for three or four weeks. By keeping the skin clean the other treatment will succeed much better, so scrub the animal with warm water and soap and rinse with clean water as often as once a week.

Where the livestock men of a community produce their animals to sell for breeding purposes, as well as to increase their production, cooperation is the greatest help possible to them. The community as a whole can be advertised, instead of the individual breeder. Thus the individual cost of advertising is cut down without cutting down the results which each one gets from the advertising. In fact, in the end, the individual gets better results from the advertising.

People are realizing more and more each year that farming is a business—that it is the greatest business in the world. And realizing that fact, they are coming to treat it as a business, instead of as a task or an occupation and nothing more. This means doing the business in a businesslike manner.

Poultry for Profit

THE GOSLINGS

IT is surprising that more farmers do not find geese a profitable side line. Breeders of long experience say that there is more money in geese than in any other class of poultry. The risk of loss is smaller than with ducks, turkeys or chickens. Geese are the healthiest of all fowls, seldom dying from disease.

Geese generally commence laying the latter part of March or the fore part of April. Our breeding geese have considerable exercise and they are kept moderately thin. We feed lightly during the laying season as overfat birds are almost worthless as breeders. Feeding has so much influence on the egg production that the latter can be controlled in winter and early spring when the fowls have to depend upon what food is given them. The opening of the laying season at our place is hastened materially by heavy feeding during the winter.

We provide large boxes or barrels for nests in the fowls' shed and then keep them penned in their yard until about nine o'clock. They generally lay during the early morning. If nests are not furnished or if the layers are given their liberty early in the morning, they may lay in secluded places where it is difficult to find the eggs. Some of the geese sometimes deposit their eggs in the floor litter and a search must be made for these.

The eggs are removed from the nests as soon as possible in cool weather so as not to become chilled. We keep them in a dry place and turn half over twice a week until needed for hatching. Goose eggs will keep for hatching 21 or 22 days when given proper care.

Until eight or ten days old the goslings are rather delicate and tender and they demand good care. The mother and little ones are placed in a dry, rat proof coop with a pen attached that contains tender grass. They eat grass almost as soon as hatched. The coop has a board floor,

for goslings cannot stand any more cold or dampness than a young chicken, and they must be kept dry and warm until four weeks old. They need to be looked after when a rain comes up, and ours are not turned out of mornings until the dew has gone off the grass. They are not allowed water to swim in at this period. As soon as the quill feathers have developed they are safely out of danger from water, though not from damp quarters. The drinking water is given in vessels they cannot paddle in.

After the first or second week the goslings have free range, though they are cooped at night for a while. A mother goose will go under shelter

POULTRY SHOWS

Riverside, Fourth Annual Poultry Show, Riverside District Fair Association, Oct. 5-9, 1915, E. I. Hammond, secretary, Riverside.

San Jose, Santa Clara Valley Association, annual show, Oct. 6-9, 1915, Chas. R. Harker, San Jose, secretary.

San Francisco, Panama-Pacific Exposition, international poultry show, Nov. 18-28, 1915, D. O. Livey, Panama-Pacific Exposition grounds, secretary.

Redwood City, San Mateo County Poultry Association, Nov. 11-14, 1915, Fred West, Burlingame, secretary.

Phoenix, Arizona State Fair, Nov. 15-20, 1915.

Pasadena, Pasadena Bantam Show, Dec. 1-4, 1915, H. J. Lowdermilk, 138 West Dakota Street, Pasadena, secretary.

Long Beach, Long Beach Poultry Association, Dec. 2-6, 1915, R. C. Kellogg, Long Beach, secretary.

Pasadena, Pasadena Poultry Association, Dec. 1, 1915, M. D. Cartwright, 1719 Morton Avenue, Pasadena, secretary.

Modesto, Stanislaus County Poultry Association, Dec. 1-3, 1915, J. D. Yates, Modesto, secretary.

Porterville, Porterville Poultry Association, Dec. 9-12, 1915, B. R. Nofziger, Porterville, secretary.

Spokane, Wash., Inland Empire Poultry Association, Dec. 14-18, 1915, Mrs. H. A. Klusman, secretary.

Tacoma, Wash., Tacoma Poultry Association, Dec. 28, 1915, Jan. 1, 1916, W. Shepherd, Sumner, Wash., secretary.

Santa Ana, Orange County Bantam and Aviary Club, third annual show, Dec. 28-31, 1915.

Los Angeles, Los Angeles Poultry Association, Jan. 5-11, 1916, Walter M. Ross, 224 Colorado Boulevard, Glendale, secretary.

Sacramento, California State Poultry Association, Jan. 14-18, 1916, C. A. Wilkins, P. O. Box 1117, Sacramento, secretary.

until the goslings are well feathered out, after which she will remain outside with her brood night and day. Little goslings do not care much for a hen mother, who soon becomes disgusted and leaves her family. Shade is provided for the goslings in hot weather, for they might be sunstruck.

Goslings are unusually hardy and seldom get sick, so losses are few if they are protected from dampness. They are rapid growers and when chicks are of the size of quails, goslings of the same age weigh five or

six pounds, and the profit from them will be large if sold early, due to the fact that the greater part of their living is derived from vegetation which they pick up on the range.—Farmers' Review.

CALIFORNIA STATE POULTRY SHOW

California's big round-up show for the coming season will be held at Sacramento, January 14 to 18, 1916, under the auspices of the California State Poultry Association in conjunction with the Sacramento Poultry Association. This is the first annual show of the state association and

promises to be one of the biggest shows of the state.

The dates selected will bring this show at the end of the list of California shows, therefore the quality will be one of the highest, for all the champions of the other shows will meet there to try for a place in the ribbons. A ribbon won at this show will be of great value to the winner as it will prove his birds to be real top-notchers.

W. S. Russell and Chas. G. Hinds have already been selected to judge. Other judges will be announced later. For membership in the association, premium list of the show, etc. write to C. A. Wilkins, Secretary, Box 1117, Sacramento.

If a Giant Cut the Wires

Suppose all telephones were silent, and that for forty-eight hours you could not even call a telephone exchange anywhere in the Bell System to ask what the trouble was!

Imagine the confusion which would prevail—with personal visits and messengers substituted for direct, instant communication; with sidewalks, street cars and elevators jammed; with every old-fashioned means of communication pressed into service and all of them combined unable to carry the load.

The instant contact of merchant with customer, of physician with patient, of friend with friend, would be severed; the business man and the housewife would lose the minutes and hours the telephone saves them. The economic loss would be incalculable.

There would not be time enough to do the things we are accustomed to do, and social as well as business life would be paralyzed.

Such a condition is almost inconceivable. The Bell System has developed telephone service to the highest degree of usefulness and made it so reliable that its availability is never questioned. It has connected cities, towns and the remotest places from coast to coast, and has taught the people the advantages of nation-wide telephone facilities.

Plans are made, buildings built and businesses run with Bell Service taken for granted, and yet we have to imagine what it would mean to be entirely without telephones before the great value of this ever-present service can really be appreciated.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department. Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115 1/2 N. Broadway, Los Angeles.

Water Right

A owns a piece of deeded land irrigated from springs located on government land and conveyed through a ditch which has been used constantly for this purpose for a period of 30 years. The water has never been filed on. B, a homesteader, has filed upon the land which supports these springs. He is now living on the land and intends to prove up on it. What are the respective rights of these two parties? What would you advise A to do in order to protect his right, if he has any?—Subscriber, Milo.

Under Section 9 of the act of congress of July 26, 1866, where an appropriation of waters arising upon government lands is made and ditches are constructed over those government lands before sale thereof into private ownership, the appropriator acquires a vested possessory title and no other or further record title is required to support his rights therein. The homesteader has no right to the spring arising upon his land, and it is unnecessary for A to do anything further to protect that right. This statute has been construed a number of times by the supreme court of this state, all the decisions being to the effect above given.

Right to Water

As has a ditch which conveys water from a stream. This ditch has been in use for over 30 years. However, the water, to the amount of 80 miners inches, was filed on by A in 1912. The stream from which above water is taken is a tributary of a river whose waters were filed on prior to filing first mentioned, but not before ditch was in use at least five years. What right has A to the water and in what way does the filing in 1912 affect the right?—Subscriber, Milo.

Actual appropriation of water to a beneficial use is sufficient, and it is a well settled law in this state that such actual appropriation without compliance with the code provisions of notice and recordation is enough to give such appropriator a right as against anyone who did not have at the time when he in fact made his diversion a superior right. Compliance with the sections of the code relative to appropriation is important only in so far as the claimant seeks to have his right relate back to the date of posting. Such compliance will cut off rights accruing between the date of posting and the actual diversion for beneficial purposes. Therefore in the above case A has a right superior to that of the second appropriator, the priority of his right running from the date of his actual appropriation of the 80 inches of water to a beneficial use which was, as stated, five years.

SOUTH SAN JOAQUIN FAIR

The San Joaquin irrigation district is planning to hold a fair at Manteca on October 8-9, which is to be known as the South San Joaquin Community Fair. It is to be given by the South San Joaquin Parent-Teachers' Association of Manteca, Ripon and Escalon in conjunction with the farm centers of these places. The fair arrangements are in charge of an executive committee headed by Mrs. Castle of Manteca. It is planned to have one day set aside for a farm stock show and agricultural display of the community's produce, the other day to be given over to domestic science work and work of the school children. The winner of the Ripon corn club will be selected at this time when all of the club members will make a display of their crops. One of the special features of the fair will be a colt and a calf show. The colts are to be shown by the farmers for prizes offered by the various stallion owners. The calf show is to be held by the boys of the community. The calf is to be of the dairy type and is to be raised under the most economical and practical dairy farm conditions.

The atmosphere governing the fair is to be community cooperation and interest, and it is hoped to bring the people of this section of the county to a realization of what their community can produce and what the schools are doing for their boys and girls.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Drilling a Well

I have a combination rotary and drop drilling machine, with just the common rotary and drop points. I wish to make a test for water and have gone down 27 feet but am unable to go farther on account of the hardness of the rock. Can you give me any suggestions of what to use and how, also cost?—Subscriber, Ramona.

The inquirer evidently has a small hydraulic well digging outfit but it will be necessary for us to have more particulars in order to answer the questions. If he has struck a boulder and not a stratum of rock he might be able to go down by moving a few feet to one side. I would advise testing this by at least making a few shallow holes, if a deep one cannot be made. If he has to go through solid rock he will need a standard rig and tools which will be very expensive.—J. B. N.

Pruning Blackberries

Please give full directions and proper time to prune Himalaya and Mammoth blackberries, also loganberries, the second summer after planting.—Subscriber, Escondido.

From a former issue of the Cultivator we quote reply to a similar query, by Mr. John Vallance of the Morse Seed Company: "Mammoth blackberries must be trellised, and when pruning the fruit-bearing wood of last year should be cut away entirely, thus depending upon the new growth for next season's crop. If these shoots are too close together they should be pruned out so as not to leave too much vine on the plant. The same rule applies to the pruning of dewberries, loganberries and the Himalaya blackberry." All canes which have borne fruit should be removed about the end of July or first of August. Fruit comes only from canes which are one year old. In "California Fruits," by Wickson, Mr. Claud D. Tribble gives the following regarding pruning of vines the second season after planting: "Give the plants some support the first season by a stake, and the second season the permanent stakes are put in, one on each side of the plant. In driving them allow the tops to be wider than the bottom so the berries can be picked easily. Large wires or wooden cleats are used to support the vines or canes. The posts are about six feet long and driven in the ground until solid, making the top about five feet high. During the first season's growth there is very little pruning except thinning to the desired number of canes. The second year the canes are allowed to grow above the stakes and then are tipped to cause laterals to form, which are cut back to less than 12 inches to produce berries the following season. The old wood is cut out each season and the new shoots trained as before. If the old canes are cut out as soon as the crop is gathered it is done more economically and the plants grow better."

Neighbor's Chickens

What is the state law in case neighbor allows chickens to run in walnut grove, and what can orchard owner do when owner of chickens refuses to keep them up when asked?—Subscriber, Santa Ana.

This is a question often asked and answered in the regular columns of this paper. In effect the state law provides that damages may be collected from the owner of the trespassing stock in case the property owner has surrounded his orchard or garden with a substantial fence. Then he may collect such damages as he can show. There is another law, however, known as the estray law, by which all live

stock not under the control of its owner may be impounded and kept until called for by the owner when he must pay certain costs for keeping the stock. In case of an orchard the damage which could be proved would be very slight.

Rhubarb Culture

I planted seed of Wagner's Giant rhubarb this spring. The stalks are quite large but I do not know whether they should be cut the first season. Kindly inform me regarding this, also what causes the stalks to die at the root when they have plenty of moisture?—Subscriber, Modesto.

Mr. J. B. Wagner replies: It would be all right for your inquirer to subdivide his rhubarb plants from seed planted last spring, but do not do so in the hot weather. The leaves or stalks of any and all plants die after maturity whether the plant has plenty of moisture or not.

Seed may be planted from November to May. If it is not a frostless section, the earlier planted the better. Plants may be set out from March to August. Last year we planted some in August and by the following May we had harvested over 25 tons per acre from them. Young plants set out now, will, with the proper care, yield a heavy crop next spring. Unlike the old style rhubarb, which takes one to two years to make a crop, the Wagner Giant strains give better results in six months than the common varieties do in 12 to 18 months. It should be planted on well drained soil and in as near a frostless section as possible. Plant one and one-half by four and one-half feet, making a dense row which shades the ground. In this way less water is needed. If frost occurs where they are planted thickly there will be little or no damage as the leaves will protect the stems.

Drying Figs

Please print directions for drying a small amount of figs, say 25 pounds—Subscriber.

In the issue of the Cultivator of July 16, 1914, Mr. George C. Roeding gives the following directions for drying figs in large or small quantities.

Unlike many other fruits, the fig in order to produce a high grade article must be allowed to remain on the tree until it loses its original form, shrivels up and drops off. Sometimes it is necessary to jar the trees slightly if the shriveled figs do not drop, or knock them off with light bamboo poles. From the orchard they are hauled to the drying ground which should either be a hard piece of ground or an alfalfa field.

The figs are dumped on trays which are stacked at once, for, as a general rule all figs—with the exception of the very large ones—are dried sufficiently so that when they come on to the drying ground no further exposure

to the sun is necessary. One of the universal complaints of California figs has been their tough skin. This is not due to any unfavorable climatic or soil condition, but is the result of over-drying. The sorting of the figs may be commenced two days after they have been placed on the trays. All the figs which have a slightly leathery feeling to the touch are thrown into a pile by themselves in the drying shed, and the bird-picked and split figs into the cull pile. These are not lost by any means, but sell readily at two and half to three cents per pound. The soft figs are packed on trays as before, the trays are stacked, and the figs remains on them until they reach the proper degree of dryness when they are thrown in with the others. It is advisable to leave the figs in the pile, which may be from three to six feet deep without the fruit being damaged in the least, for a period of two weeks, turning the figs over with a scoop shovel at least once during this period or oftener if time will permit.

Just prior to delivering to the packing house give the figs a thorough washing in a brine having not less than four ounces of salt dissolved in a gallon of water. A pruner dipper may be used to good advantage for this work. The figs should remain in this brine for a period of 10 to 15 minutes, depending on their condition. They are once more placed on trays, two or three inches deep, exposed to the sun for half a day to allow the water to drain off, and the trays are again stacked. Within two days they can be dumped into sweat boxes and are ready for delivery. This processing not only cleanses the figs, but it softens the skins, causing them to feel like a kid glove when squeezed between the fingers, and in addition to this the figs present a bright and most inviting aspect. They are a delight to the eye and appeal to the palate as no other fruit does.

Corn Ear Worm

What is the best method of preventing worms from destroying ears of corn?—Subscriber, San Dimas.

There seems to be no way of controlling this pest other than to plant a catch crop, which in the case of corn usually means somewhat larger planting than it is expected to harvest. No spray is effective for the reason that the egg is deposited beneath the husks of the corn.

Weevil

We are troubled with worms in our lima beans. What may be done for them?—Subscriber, San Dimas.

We presume by worms our subscriber refers to the common bean weevil. There is no satisfactory control of this pest in the growing crop. As soon as the beans are gathered they may be treated as recommended by Mr. Essig in "Injurious and Beneficial Insects of California": "While many remedies have been recommended for the control of bean and pea weevils, there is nothing that will compare with fumigation in an air-tight receptacle. Carbon bisulfid, at the rate of three pounds to each 1000 cubic feet of air space for a period of 48 hours, is recommended for small lots and hydrocyanic acid gas at the rate

of two ounces of cyanide to 100 cubic feet of air space, one hour for large quantities.

Relevelling Alfalfa

We have alfalfa planted a year ago this spring which was not properly levelled and did not grow well in spots. Expect before next spring's planting time to replant. Will there be any injury from the roots of the old crop?—Subscriber, Galt.

Do not think there will be any injury whatever other than that the roots will make the levelling somewhat more difficult, but any which are left in the ground will only add to the stand when the reseedling is done. In fact the only way of renewing is to thoroughly disk the ground and split up the old roots.

Tree Injured by Rabbits

What can I put on trees which have been injured by rabbits; that is, can I paint them so that the wound will heal over more quickly, or is white-wash better?—Subscriber, Galt.

Grafting wax is good. Also we have seen trees which were gophered for more than a foot above ground treated in the following way: When found before they had dried off at all a pile of mud was placed against the trunk and heavy irrigation given to keep this coating wet, with the result that the whole surface granulated and new bark formed. It must be borne in mind, however, that to do this a tree must be taken almost immediately after the injury. If the tree has been completely girdled and the wound allowed to dry, then the only way of saving the tree is to use the bridge graft, which consists of putting scions taken from good, healthy trees underneath the bark, both above and below the wound. These will maintain the flow of sap until the new bark can be formed over the new wound. This requires most careful handling. The method of doing the work was illustrated in the Cultivator of July 23, 1914.

THE INTERPRETER

James Ross and his daughter Janet, from Canada, visited relatives in Chicago recently, remarks Everybody's Magazine in beginning this story. Day after day Janet and her father went sightseeing, always together.

Janet's aunt, noticing this, one day suggested that she let her father go downtown alone occasionally, and added, jokingly, "Men do not like to have women always tagging along."

"Ay, ahntie, but he wahnts me," explained Janet, earnestly. "He canna thole to stir oot o' the hoose his lane. Ye wadna believe hoo fasht he is onywhere wi'out me. Ye see, faither taa'ks sic braid Scoatch that stranger folk dinna ken what it's a' about, an' I hae tae gang wi' him tae dae the converssin."

Jelly Making

Timely Information for
the Preserving Season

Many women have all kinds of trouble when it comes to making a good jelly. If the following simple instructions are carefully followed, the results will prove most satisfactory:

Strain juice through a full flannel bag. Do not squeeze the bag at first. When the juice has dripped over night, the bag may be squeezed, but this juice should be kept separate. The jelly made from it will not be clear, but can be used for jellycake, etc. Weigh juice and add three-quarters as much sugar and corn syrup as fruit juice. The sugar should be heated and added slowly to the boiling juice; then add the corn syrup. Jelly may be tested by dropping a little on a cold plate. It is sufficiently cooked if it thickens slightly.

The ideal corn syrup for use in jelly making is the brand known as Karo (Crystal White). When properly blended with the sugar it will assure the heavy syrup so much desired, while avoiding the cloying sweetness which results when sugar alone is used.

Try Karo (Crystal White) syrup this preserving season, and ask your grocer for the little Karo Preserving Booklet, which gives detailed instructions regarding jelly making and preserving.

"ARE YOU ONE OF MY GANG?"

Are you one of my gang?
Yes you're one of my gang.
The same job is yours and mine,
To fix up the earth,
And so forth and so forth,
And make its dull emptiness shine.
The world is unfinished; let's mold it a bit
With pickaxe and shovel and spade;
We are gentlemen delvers, the gentry of brawn,
And to make the world over our trade.
And I love the sweet sound of our pick-axes' clang,
I'm glad to be with you. You're one of my gang.

Are you one of my crew?
Yes, you're one of my crew,
And we steer by the same pilot star,
On a trip that is long
And through storms that are strong;
But we sail for a port that is far.
O, the oceans are wide—and we're glad they are wide,
And we know not the thitherward shore,—
But we never have sailed from the Less to the Less
But forever from More to the More.
And we deem that our dreams of far islands are true.
Let us spread every sail. You are one of my crew.

You belong to my club?
Yes, you're one of my club,
And this is our program and plan:
To each do his part
To look into the heart
And get at the good that's in man.
Detectives of virtue and spies of the good
And sleuth-hounds of righteousness we.
Look out there, my brother! we're hot on your trail,
We'll find out how good you can be.
We would drive from our hearts the snake, tiger, and cub;
We're the Lodge of the Lovers. You're one of my club.

Do you go to my school?
Yes, you go to my school,
And we've learned the big lesson,—
Be strong!
And to front the loud noise
With a spirit of poise
And drown down the noise with a song.
We have spelled the first line in the primer of Fate;
We have spelled it, and dare not to shirk—
For its first and its greatest commandment to men
Is, "Work, and rejoice in your work."
Who is learned in this primer will not be a fool—
You are one of my classmates. You go to my school.

You belong to my church?
Yes, you go to my church,—
Our names on the same old church roll—
The tide-waves of God
We believe are abroad
And flow into the creeks of each soul.

And the vessel we sail in is strong as the sea
That buffets and blows it about;
For the sea is God's sea as the ship is God's ship,
So we know not the meaning of doubt,
And we know, however the vessel may lurch,
We've a Pilot to trust in. You go to my church.
—Sam Walter Foss, Author of "Songs of the Average Man," in "Unity."

HOW A FARM WOMAN FOUND HERSELF

By Mrs. Emily Hoppin, Before the
State Fruit Growers' Convention
at Stanford University,
Palo Alto

NE of the most pleasing speakers at the recent state fruit growers' convention at Stanford University, Palo Alto, was Mrs. Emily Hoppin. She made addresses before the women's sessions of the convention; also in the general convention meetings at which all gathered. The following address was made on Friday evening before the entire convention. The next day Mrs. Hoppin was taken ill, and though she succeeded in reaching her home, from it she was taken to the hospital at Woodland and on August 4, died.

Mrs. Hoppin was president of the California Federation of Women's Clubs and one of the most prominent women of the state. She has lived many years in Yolo County and has been an inspiration to women who have found themselves confronted with the problem of homemaker and breadwinner combined. Her own place has been most successfully managed. Her loss will be greatly felt in her home community and in the state.—Ed.

The next fall found John and Mary on a ranch in California, a long low building in the middle of 1500 acres; a beautiful ranch with stately oaks and waving grain.

There was a big kitchen. Mary had read of the beautiful farm kitchens with their spotless floors, the sunlight lying in bars across them, the tins shining on their shelves, all very peaceful and attractive; but the writers forgot to mention the steps. Ten steps from table to pantry in Mary's big kitchen, 15 from stove to sink, just as many and one step down from sink to dining room; a screen door to open, two steps down and 20 from sink to pump, for no one had running water then. Fortunately, Mary did not have to take them all. One stout Chinaman always, and two in the summer, but they as a rule were more of a trial than the work, for the Chinese who found their way to the ranches were coarse cooks and not too neat.

There were the men, from 12 to 20, filing by the windows three times a day; there was the stranger within the gates, and the lame, halt and blind who came to stay not only days, but weeks and even months.

The years passed. Mary canned fruit, cared for chickens, skimmed cream and churned butter, bathed and dressed and cared for physically, mentally and spiritually, four little chil-

Good Pie Crust

A Simple Art Which Few
Women Master Thoroughly

In this country of pie eaters every woman should number among her other qualifications the art of making a good pie. It is surprising how few otherwise good cooks can make a perfect pie crust. The following recipe for a plain pie crust is especially valuable, because it was selected by the publishers of a famous cook book, out of hundreds of recipes that were submitted by eminent cooks in all parts of the country.

1½ cups flour, ¼ cup cornstarch, ½ teaspoon baking powder, ½ teaspoon salt, ½ cup lard, ¼ cup ice water. Sift the ingredients together. Cut in the lard till of the consistency of meal. Cut in the water quickly. Handle as little as possible—else it will be tough.

Even though you are rated a good pie maker, we would urge your trying this recipe. But just one word of caution—use good cornstarch. The one who originated this recipe—like thousands of other cooks all over the world—always depended upon the famous Kingsford's brand.

Insist upon Kingsford's—which costs no more than inferior kinds—and ask your grocer for the little Corn Products Cook Book, which contains the above recipe—also a recipe for a richer crust if desired.

Goodbye Ants

No Longer Can You Drive the
Good Housewife to Distraction

The pesky little ant—the bane of many a housekeeper's existence—has met his Waterloo at last. No longer can he overrun the pantry and infest the sugar, jam and other foods—to the disgust and mortification of the woman of the house.

The ant is hard to kill, and countless remedies were tried upon him without result. It was a sorry day for the ant family, however, when they started to overrun the candy shop and bakery of an ingenious resident of Los Angeles.

Driven to desperation by the annoyance, this man, after much experimenting, devised a paste whose effect upon ants borders upon the supernatural. Suffice to say, it hid his entire shop of the pest in one day.

This wonderful remedy is now put up for general use under the name of Kellogg's Ant Paste and can be obtained at all modern druggists or grocers. Insist upon Kellogg's, and your ant troubles will be a thing of the past.

**Make Weak Eyes Strong;
Keep Strong Eyes Well**

Those who use Dr. Thompson's Eye Water in the care of their eyes never stop singing its praise. It cleanses them of every foreign particle; it strengthens the tissues; removes the cause of inflammation. Keep your eyes healthy and they will help keep you. Should be used as regularly as a tooth brush. One 25c bottle will convince you. At your druggist, or John L. Thompson, Sons & Co., 159 River-st., Troy, N. Y. Booklet free.

READY BUILT HOUSE COMPANY
974 Broadway Portland, Ore.

dren who by this time had come to her and John, superintended in the fall the preparing of the by-products of the 30 or more porkers that had been sacrificed for the ranch use, but every spare moment she spent with her books. Those spare moments were the bright ones of the day and the quiet twilight ones when the children were in bed and she could watch the wonderful skies and the blue hills.

It had never occurred to Mary that she did not have to do so much. John had put a check book in her hand, had her leave her signature at the bank, and told her to help herself, but that fact did not make much impression. They lived the pastoral life of the patriarchs of old, and aside from the occasional trip or the buying for the home Mary, in her isolated life, had about as much use for a check book as Sarah or Rebecca would have had if Abraham and Isaac had handed them one.

Sometimes Mary visited her neighbors and came home more contented for some of them had the crowd of men and no Chinaman; they had all these other things to do just as Mary had; they had no fruit to use, much less to give away, and no check book they knew they could use, only their persuasive powers to coax a few dollars out of their Johns.

Mary began to feel that John was growing away from her, for aside from the home topics he had little to say. He would come into the house, read the daily papers and the magazines, bury himself in a book, and in the winter the "Congressional Record" had to be read word for word during the sessions of congress, and John loved dearly to talk it over, but never with Mary.

Finally Mary gave herself some sober thoughts, and shaking herself figuratively, said to herself: "Here you are, living in a circle. By the time you are forty you'll not know enough to talk even to the chickens. Wake up! get out of your rut and know what is going on. You can have intellectual reading and communion with saints, but everyone ought to be alive to the things around him."

She began by acquainting herself with the proceedings of congress, as John was so interested in them. Those were the days of Blaine and Conkling and men of equal ability. Their speeches were well worth reading, and when John found she was reading them he seemed to enjoy talking them over with her; then she found that he loved poetry as well as she did. Congressional proceedings and poetry seemed a queer combination, but Mary remembered the advice Charles Eliot Norton of Harvard once gave:

"Whatever your occupation may be, or however crowded your hours with affairs, do not fail to secure a few minutes each day for refreshment of your inner life with poetry. It performs a three-fold duty of revelation, history and memory."

Then Mary discovered a new side to herself and John, and it was that he liked best her having her own opinions. She had supposed that most men who had such an air of finality in their own views wanted women to be a species of parrot to echo their words.

"There is no reason," John said, "why women should not have a voice about everything."

"Voting, too," said Mary.

"Certainly, why not," replied John. "I would if I were you, Mary, stand for everything that meant growth for women."

Another thing Mary discovered was that John liked it better when she announced a decision instead of asking him for one.

John gave the land, and the county graded and gravelled a good road which gave more opportunity for visiting; the windmill, and later the gas engine, made it possible to pipe the water to the kitchen and bath; the milk separator was the first one in the county, for John loved new inventions, and how it simplified the butter problem! Mary saw that conveniences were in the kitchen, and John was so interested in buying new things every agent found in him his heart's desire.

Then the joy of being a neighbor to the whole world; of occasionally forgetting the chickens and butter and fruit and living with people who thought great thoughts and did great things.

It was Ibsen who opened the door to Mary and showed her how women have accepted through all the centuries things as they were, and not as they might be, for all women have to do is to go through the door and take possession.

I think of those early Californians, their high ideals of women and their chivalry to them; their upright dealing; the generosity of many of them which with some was not almost but quite a fault; and I rejoice that their mantle had fallen on our California men of today who have given us a full measure of justice and kindness. The Eastern man has it yet to learn to give, but the time is coming when men and women will rule together. There is coming, also, a civilization that will sound the death knell of war about which nothing good can be said and everything evil.

When Mary found herself she found all women, for all women have a common weal and a common woe, and she found the manhood of the men of the farm, for it is they who have given us our privileges and the state its best laws.

Do you remember the year when you voted as to whether we should have the right of suffrage? On the morning after election we looked at each other and said, "We have lost." Then came the message from Siskiyou and Modoc, from Inyo and Humboldt, from San Diego and Placer, and the message was "Yes." Never think we shall forget, nor forget how you have helped us Marys of the farm to find ourselves. Stand by us still as we try to bring still better conditions to the farm women and to all women. Use your influence to have school libraries in every county in the state. Help us to find the best way to deal with the wayward boy and girl; help us to make the immigrant a blessing, not a curse; help us to have the true civic spirit encouraged of tidy, convenient homes, of well kept cities, of the banishment of vice in all its forms.

We of the farm hold the balance of power in this state, and if we will we can say to the people of the cities, "You shall." We of the country have high ideals, for we "are out in the fields with God."

"With windows to open and let in the sun;
And radiate light when the day is done,
And the breeze of the world blowing through."

Dissolve a tablespoon of painter's size in a pint of warm water, and with this wash white paint, using a chamois leather. It takes off the dirt easily, and leaves the paint highly polished.

Kitchen Economy

With wood or coal—waste heat. Too much or too little for best cooking. In hot weather too much heat coming out into the room.

With a good oil-stove—no waste heat or fuel. One burner or four—low flame or high—a slow fire or a hot one. All the convenience of gas for every home, all the year round.

New Perfection Oil Cook-Stove

For Best Results Use Pearl Oil

Better cooking,—flame adjustable to just the degree needed for roasts, for bread, for pastry. No odor. Does not taint the food. A cool cook and a clean kitchen. Ask your dealer. See demonstration, Palace of Manufactures, Panama-Pacific Exposition.

HAY

Under date of August 7, 1915, Scott, Magner & Miller say:
Receipts of hay for the past week were 4740 tons, about the same as last week. Although these receipts are

somewhat heavy they have moved off well. Market conditions seem to show a little improvement. Export trade the past few months has taken vast quantities of hay and this, with the acknowledged shortage of the crop in most sections, gives the market a buoyancy which it has not experienced for some time past. Several round lots have been purchased throughout the interior districts during the week at advanced prices. Arrivals of alfalfa are very small. As a rule the Sacramento River piles alfalfa in during this season but to date the receipts have been moderate and this commodity is selling well at advanced prices. Practically no hay from the interior alfalfa districts is arriving at the present time. Large offerings of straw are being made but trade is very limited, most people preferring the cheaper grades of hay for this purpose.

We quote the average wholesale price of hay in carload lots on today's market as follows:

Citrus Fruit Market

Los Angeles, August 11, 1915.

The better prices prevailing for Valencias last week are still maintained, in some cases they are even slightly higher. Shipments are very light; a few packing houses have suspended operations for a short time and will hold fruit for expected better prices in September and October.

The lemon market is practically unchanged. Some sales are reported 25 cents higher than the last few weeks.

Shipments

Shipments of oranges from Southern California to date since November 1, 1914, 30,628 cars; lemons, 5,640; total, 36,268. To same date last season, oranges, 35,570; lemons, 2,534; total, 38,104. From Tulare County this season, oranges, 5649; lemons, 202; total, 5851. Last season to same date, oranges, 5875; lemons, 30; total, 5905. From northern counties, oranges, 630; lemons, 2. To same date last season, oranges, 404; lemons, 5.

NEW YORK, Aug. 9.—Ten cars Valencias, one mixed car and four cars lemons sold. Oranges strong, generally slightly higher. Lemons also slightly higher. Fair.

VALUE OF TREES

(Continued from Page 152)

as able as any trees to carry through our long dry summers without water, none should hesitate to plant them freely in any and all situations where trees are desired.

The Land of Pergolas

In a land free from forbidding snow and ice, where one may with comfort stay in the garden nearly every day in the year, there should be an abundance of garden accessories, especially of such as will provide rest or carry an interesting vegetation. To the latter class belongs the pergola and nowhere should it be more common than in our land of almost perpetual sunshine. Still, their use or position should not be forced. Pergolas should be founded in utility. Do not place one so that it begins nowhere and ends similarly. Let it connect some house entrance with a garden entrance or division of a garden or lead to a summer house, pool, tennis court or even a dignified seat.

MOTORISTS SHOULD BE BETTER INFORMED ON LUBRICATION

"A consideration of the properties of cylinder oils and an analysis of the conditions under which they lubricate leads us to the belief that a large majority of the complaints about cylinder oils can be accounted for as due to ignorance regarding the principles governing their use." So says Lieutenant G. S. Bryan of the naval engineering experiment station, Annapolis, Maryland. Continuing his article in the Journal of the American Society of Naval Engineers for February, he states:

"The three essential requirements of a good motor cylinder oil are: It must lubricate the piston efficiently at the temperatures encountered in the cylinder; it must give a good seal to the piston and rings, keeping them tight and preventing leakage of the oil and condensed gasoline past them; it must burn without forming carbon deposits in the cylinder when an excess of the oil gets into the combustion space.

"We have seen that with the water boiling in the jackets the temperature of the inner surface of the cylinder walls will be about 267 degrees Fahrenheit. The temperature of the layer of oil that is in immediate contact with the cylinder walls, which is the part that regulates the friction, cannot be much higher than this. I do not know of any motor oils that have a flash point lower than 325 degrees Fahrenheit. If the temperature of the cylinder walls gets up as high as this in a water-cooled motor there is something radically wrong, and the remedy is not to get another oil of higher flash point but to locate the trouble and remove it.

"It is an old theory that was never founded on solid facts that a high flash point is a necessity in a motor oil or the oil will burn up without giving any lubrication. The point was overlooked that when we have a maximum temperature of the gases in the cylinder of 2,700 degrees Fahrenheit and an average temperature of 950 degrees Fahrenheit, an oil with a flash point of 450 degrees Fahrenheit will offer but little more resistance to burning than would one of 350 degrees Fahrenheit.

"Either oil will burn if kept for any length of time in contact with the hot gas. Lubricating oil does not burn very easily or very fast, however, and the time given for it to burn in a motor cylinder is very short."

PHONES AND POWER FOR GLENN COUNTY FARMERS

The farm bureau of Glenn County the past two months has been collecting data in each farm center relating to the extension of needed electric transmission lines for power and the lighting of farm homes. Maps and other information have been prepared by the farmers showing individual needs throughout the county. Operating companies in the county have already expressed their desire to give the wants of the farmer most careful consideration. The bureau is also making special effort for more efficient telephone service throughout the rural districts. The farmer's business demands adequate telephone service and if such service cannot be obtained from existing companies a

number of farmers' cooperative lines will be established throughout the county.

So far as we can learn the first attempt at publishing an agricultural or farm paper was made in England in 1681. John Houghton started the "Collection of Letters For The Improvement of Husbandry and Trade." As the name implies Houghton had the right idea of a farm paper. He filled it with the practical experiences of his readers. That plan has always beaten the long essay type of paper. In that age, 200 years ago, America was supposed to be a wilderness, yet it is probable that Boston and New York knew more of each other than one rural county of England knew of the next one. Those were the days when, in order to stimulate the clothing trade, the English Parliament passed laws ordering the burial of the dead in woolen cloth.—Rural New Yorker

"SOME" TIRES

One of the most thorough tests ever put on automobile tires was the one that Goodyear Cord Tires have just come through triumphantly—as equipment of the fleet of armored Cadillacs which have reached the coast in charge of Col. R. P. Davidson, president of the Northwestern Military and Naval Academy, Lake Geneva, Wisconsin. The colonel has been training his boys in military motoring for several years. Two armored cars were in the 1910 Glidden Tour.

This year he undertook a military cruise from Chicago to the coast, the first that automobiles have ever made under military regulation. Road conditions could hardly have been worse. It was a continual battle with the elements. Literally plowing through the western roads with the cars covered with gumbo mud, the members of the expedition are thoroughly satisfied that one Wm. T. Sherman knew whereof he spoke when issuing his famous definition of war.

Upon their arrival at San Francisco almost all the front tires remained untouched, and the entire equipment on three cars still contained Chicago air. As exponents of the strenuous life Goodyear Cords have demonstrated they can withstand any test that actual warfare could exact, as the tour just completed was as arduous as any in which Uncle Sam's regulars have participated. It is expected this long tour will influence materially the war department's attitude concerning the military automobile other than truck type.

ANNOUNCEMENT OF ROAD BUILDING BULLETIN

Since farmers have become the chief purchasers of automobiles interest in better roads has increased wonderfully. But as every motorist knows, methods of road maintenance are sadly in need of organization.

The Du Pont Powder Company, realizing the growing need for an exhaustive bulletin written in a plain, popular style covering the location, building and maintenance of roads, announces the publication of a comprehensive treatise on this subject for free distribution.

The book is fully illustrated with photographic views and special plan and sectional drawings of roads. It may be obtained free on request by anyone interested in the subject.

**Mogul 8-16 Oil Tractor
\$675.00 Cash f. o. b. Chicago**

THE small-farm tractor is here to stay. Farms even smaller than 100 acres are rapidly being equipped with Mogul 8-16 oil tractors. Since their introduction, the great plant at Chicago has been turning out these machines by the thousands and is still behind orders.

There is only one reason for this unprecedented demand. Tractor farming pays. Horse boarders are cut down to the small number required for cultivating and the few other jobs for which tractors cannot be used. The plowing, disking, seeding and harvesting are finished without relation to the effect of weather on horses. Costs are reduced all 'round. Net farm profits are higher. Tractor farming pays well on small farms when the work is done with a Mogul 8-16. The longer you put off buying one, the more money you lose.

The Mogul and Titan lines include larger tractors to 30-60 H. P., all operating on low grade oil fuel, and a full line of general purpose oil engines, from 1 to 50-H. P. in size. See the local dealer who handles these machines or write us for full information.

**Get Your Crop in
on Time with a
"Creeping Grip" Tractor**

WHY let low, wet spots in your field set you back? Your time is limited—your crop must be started without delay if you want maximum yield when harvest time comes.

Here's the tractor that asks no favors of soft, wet ground. It can pull your plows through any ground that's worth working. The creepers do not sink or pack the soil—they cannot slip and lose power. They creep along over the ground, getting a firm grip and giving you maximum traction with the least weight on the soil, least consumption of fuel, and least wear and tear on the power plant.

The machine rides on steel rails on the endless track. The creepers oscillate over rough spots. Thus the power

plant is carried smoothly, free from jolts and vibration. The frame sets up on 3 points of suspension, which eliminates binding on the bearings.

No other power is as well suited for pulling your plows, harrows, seeders and combined harvesters. Let us tell you how you can cut your present cost of doing this work.

Write for Catalog

No other tractor is as carefully built as the "Creeping Grip." We put in it the best materials than can be produced. A demonstration will convince you. In writing please tell us how many acres you operate, so that we can suggest the best size suited for your work.

Books

This list is prepared with the purpose of enabling our Cultivator readers to supply themselves with standard books at lowest possible prices. We call especial attention to a few of the new publications. "Citrus Fruits" by Professor Coit, of the University of California, covers all phases of the Citrus Industry under California conditions—the kind of a book we have had many calls for but never before been able to supply. "Productive Feeding of Farm Animals" by Woll, will command special attention. "Poultry for Profit" (The Cultivator Poultry Book) by Koethen, another California book, is new and excellent, telling what to do and what not to do with poultry in California; a sure guide to poultry success. The new Standard Encyclopedia of Horticulture, by Bailey, is not equalled by anything of the kind which has ever been published at any time in any language. Special terms of payment and discounts are offered by the publishers through us on this Encyclopedia. Write us about it.

Fits Any
Pump. A
Child Can
Operate It

A Vital Necessity On Every Farm

This Farm Pump Engine should be on every farm, not because of the time, work and money it saves but because of its great adaptability for all kinds of farm labor. This engine will supply from 270 to 2450 gallons of water per hour on the hottest, coldest and calmest days. It will enable you to have all the water you want for your stock, household use and for washing your wagons, farm implements, etc. And in addition, the

Fuller & Johnson Farm Pump Engine

will run your cream separator, washing machine, churn, grinder or any other mechanism that is run by hand power. This Farm Pump Engine runs steadily, easily, without watching and without vibration. It comes to you ready for instant use, there are no extra parts to buy and it can be attached to any pump without extra fittings, special platform or foundation.

Write Now for Interesting Literature

The literature on the Farm Pump Engine describes in detail just what it will do. It shows clearly and briefly how it can save its owner work and money, and the many testimonials we have prove conclusively that the claims of the makers as to what it can do are not only truthful but very conservative.

The Fuller & Johnson Farm Pump Engine is the lowest priced machine of its kind on the market. It is also the only one of its kind made which will give such a variety of long, dependable service.

Vol. XLV No. 8

LOS ANGELES: THURSDAY, AUGUST 19, 1915

One Dollar Yearly

Coast and State Nurserymen Associations

Two Associations Meet in San Francisco. The Coast Association Adjourns to Meet Another Year at Medford, Oregon.

NOTWITHSTANDING the quiet season there was a good attendance at the combined meetings of nurserymen held in San Francisco last week.

President Vallance of San Francisco presided over the sessions of the Coast Association and Mr. C. A. Tonneson, for many years secretary of the association, attended to the details of convention work. Probably the two principal lines of discussion were much the same as for the last few years, that is, a demand for more uniform horticultural legislation and an effort to secure more just transportation rates. With each city and each county having separate horticultural laws the life of the nurseryman is a burden and the trade is justified in demanding more uniform treatment and better opportunity to do business. He is willing to submit to supervision of a constituted authority, but does not wish that supervision to be assumed by as many as it now is.

The next place of meeting of the Coast association is Medford, Oregon, and officers elected for the ensuing

year are: President, S. A. Miller of Milton, Oregon; Vice-Presidents, C. F. Lansing, Salem, Oregon; A. J. Elmer, East San Jose, California; P. A. Dix, Roy, Utah; E. F. Stephens, Nampa, Idaho; D. G. Tighe, Billings, Montana; F. A. Wiggins, Toppenish, Washington; Joseph Brown, Vancouver, British Columbia. Secretary C. A. Tonneson of Tacoma, Washington, was re-elected. Standing committees will be appointed later.

From President Vallance's opening address we quote:

"The dream of my boyhood days across the water was that I might become a nurseryman, and in this great state of California that dream came true.

"For 30 years as a nurseryman I have lived with the flowers and plants that grow no where so profusely as on our beloved coast. As a young man I did not dream, Friends, that some day I would be chosen the president of one of the great nursery associations of the United States. That was an honor I could not anticipate, an honor that I have to thank you for, one that I

can assure you I deeply appreciate, and one that shall never be forgotten by me."

Mr. Vallance referred to the mortality of plant life which is out of proportion to what might be reasonably expected. Instead of 99 per cent of the trees and plants which are sold by nurserymen living, as they should, he stated that "neglect and careless handling, both before and after planting, reduce the vitality to such an extent that 70 per cent of the fruit trees sold succumb before reaching fruition age."

He stated that there are 40,000,000 fruit trees of fruiting age in California, more than one and a half million tons of fruit are marketed annually, requiring 75,000 cars of 12 tons each to handle. These cars will make a train 1,000 miles long. The president made an appeal for more uniform horticultural laws, for the raising of more seedlings on the Pacific Coast instead of importing so many, for the standardization of prices, for restriction on production of stock, for harmonious action between nurserymen and horti-

cultural commissioners. In closing the president referred to the Panama Pacific Exposition as follows:

"Today we who represent the life of the vegetable kingdom are meeting in the heart of a great city surrounded by huge buildings of steel and concrete, brick and mortar. Here the mineral kingdom has come into its own in this new San Francisco, the most modern city of the world. It is well for us to be here at the very gates of the greatest exposition ever conceived by the mind of man. We will find within its walls the beautiful, the wonderful and the marvelous from every country, every clime. Here, too, you will find the work of the nurseryman, the landscape gardener, the florist and the seedsman, kindred vocations, represented by the beautiful flowers, plants and trees without which this monument to man's genius would be incomplete."

The program as given in a former Cultivator was followed, and it is impossible to even refer to all the addresses and discussions. As the most

(Continued on Page 174)

Prune Culture in Santa Clara Valley

Leonard Coates Writes for Cultivator Readers of Cultural Conditions in the Greatest French Prune Growing Section in the World.

THE French prune crop reached its maximum in 1912 with 205,000,000 pounds. Previous to that the only crop nearly approaching this amount was in 1902 when 197,000,000 pounds was the total output. These figures appear, and are, rather gigantic, most of this crop being consumed in the United States, and much more might be were there a general and continual system of advertising. If this is brought about the scare produced by the alleged tremendous export shortage, owing to blockade of German ports, will be more of a blessing than otherwise.

There are two phases of the prune industry which are interesting at this time though very different in character. One is the summer treatment of young trees.

Summer Treatment

The second year after planting the French prune tree makes a very strong upright growth though with the wavy outlines peculiar to the type. There will generally be six or eight, or even more of these shoots, crowded together, the common practice being to thin out all but four or five the following winter. Some growers then shorten them to about one half, and some are content with the thinning out, doing no shortening-in.

A better way is to thin out to three

or four, never more, and let these be selected so that they start from the main stem as far removed from each other as possible. Then cut them back to about two feet of growth.

This thinning out should be done early in the summer, as it will throw more strength into what is to permanently remain, and allow air and sunlight to get to the center of the young tree. This is very important, for it enables the buds on the laterals, or future fruit spurs, to ripen and develop. These small laterals should be cared for from the start and cut back to three or four buds any time after they have finished their season's growth. The prune tree, like the apricot, should have its main branches clothed with fruit spurs which ought to be shortened back to three or four buds of every season's growth. Almost invariably these laterals are allowed to elongate indefinitely, receiving no attention until, in after years, the tree is considered too "brushy," and the pruner, with his two-handed shears, lops off all the "brush" he can reach. It is the main wood growth that should be sufficiently thinned out while the trees are young, and the laterals given plenty of sun and air and kept shortened-in to make them sturdy and fruitful.

Does it ever occur to prune growers that the whole plum family (domestica species) bears its fruit mainly on two-

year-old spurs? These spurs take several years to develop, however, depending upon climatic and other local conditions. How can one get a continuous supply of two-year-old spurs as the tree grows older without annual shortening of these spurs? The growth of the pendent laterals (which should be stocky, branched "spurs") becomes less and less as the tree matures, so that in after years while the whole tree, beautiful to look upon, a "blossom festival" in itself, covered with bloom, has indeed very little of the actual two year old spur bearing wood. This is heretical, I know, according to the ideas of many prune growers, and a non-observance or carrying out of this old theory of horticulture may be the reason why we do not at this time have a great holdover of prunes, a 200,000,000 instead of a 100,000,000 pound crop.

Curing

Curing will occupy the attention of prune growers for the next three or four weeks. The preparatory work consists in smoothing and pulverizing the surface of the ground by using the roller or clod masher after the spring rains are over. The quality of a prune pack is impaired if there are bruised fruits or those with broken skin.

It must be assumed that trays, if not new, have been thoroughly cleaned, an operation too often neg-

lected but which should be done in the fall before they are put away for the winter.

What is known as "June drop" of prunes is absolutely worthless as a food product, and the first apparently mature prunes that fall the early part of August should not be used. It is safer to have them raked up or gathered so that they will not be liable to be added to the crop by the pickers. They will be found to be dry and almost tasteless, though in appearance normal. Let the fruit drop naturally; do not shake the trees until the last picking when some prunes will hang on too persistently. Never use poles to knock the fruit off as this is very injurious to the tree.

French prunes, Sugar prunes and Standard prunes have a skin of similar texture, so that the same strength of the lye dip may be used for all of them. Robe de Sergeant can stand about the same strength, but it is better to have the lye a little weaker. The Imperial requires a very weak solution; boiling water will do, if it is really boiling. Use a standard brand of lye, one pound to 20 gallons of water, with the exceptions as just noted. It is better, much better, to rinse the prunes by a fresh water dip after two seconds' immersion in the lye solution, and also to change the lye solution frequently, as it soon becomes

SCHOOL OF FUMIGATION

OR 28 years California has been using hydrocyanic gas to control insect pests on orange trees. Investigation of this method of control began about 1886. It was, however, some years before it was reduced to a practical working basis, but the menace of the white scale which almost destroyed the citrus orchards of California before the introduction of the vedalia forced the growers to investigate every possible method of control. The fumigation process cannot be said to be the work of any one investigator for many have had a hand in the efforts to bring it to a successful process, and strange as it may seem after more than a quarter of a century of use some methods now being perfected which are found to be the most satisfactory were among the first to be tried and discarded. To more fully investigate these methods and to secure information as to best practice Prof. C. W. Woodworth of the state university called for a meeting to be held at Pomona August 9. The wisdom of the choice of Pomona was demonstrated by the liberal attendance from the start. The first day's sessions proved the assembly room in the basement of the high school to be entirely too small and the larger room afterwards chosen was filled to overflowing.

In the evening when the fumigators went to the orchard of J. W. Mashmeyer to see practical work of fumigation under the old method of generating gas in vessels under the trees, also tests made with different fumigating machines, the procession of automobiles was nearly a mile in length.

Of course the attendants were not all from the district around Pomona, various sections from Santa Barbara to San Diego being represented.

At the first session Prof. Woodworth gave two lectures, one being historical and illustrated with lantern slides, the other giving account of cyanide injury, followed by laboratory experiments showing effect of cyanide and of acid on the fruit.

In opening his talk on the history of fumigation Prof. Woodworth stated that this was the first school of its kind ever held. He further stated that the sessions during each forenoon would be given over to discussion of some phase of insect life, and during the afternoon to the chemistry of fumigation, with addresses each evening in the assembly room, followed by field experiments and field discussions as to methods.

Historical Sketch

Credit for first discovery of the efficacy of hydrocyanic acid gas fumigation is due to Prof. D. W. Coquillett, at that time field agent of the department of agriculture, though the records of the patent office show that on the 14th of May, 1867, a Massachusetts man secured a patent on a process of "covering the entire head of the tree with a thin cloth of close texture, drawing the edges around the trunk so as to envelop the branches in a sort of sack. Near the tree I have a furnace over which is placed a pan

containing tobacco, pepper and other substances, the smoke from which will stupefy and kill the worms."

In California J. W. Wolfskill of Los Angeles was probably the first to take up the matter of the need of better methods for insect control. At that time, 1886-1887, the superintendent of Mr. Wolfskill's orchard in Los Angeles was Alexander Craw. In the report of the department of agriculture for 1887 Mr. Craw writes fully as to the efforts which began in 1884 to control the white or cottony cushion scale. The first attempt in that orchard to control the scale through the use of a tent over the tree was by the means of heat. A sheet iron stove was constructed conveying heat into the tent. The temperature was raised to 128 degrees Fahrenheit and held there for an hour. It killed the black scales but the white only thrived. The tree was also injured and the heat proposition was given up. Steam likewise failed. Six hours' submission to tobacco smoke failed; sulphur fumes did no harm to the scale and injured the trees or killed trees if used sufficiently strong to kill the scale. Concussion from gunpowder, muriatic acid, carbonic acid gas, liquid chloroform and gas from chloroform manufactured under the tent, arsenic, bisulphide of carbon and other fumes and gases were tried.

Prof. Coquillett's first experiment with hydrocyanic acid gas was in September, 1886. It proved successful in killing the scale but unfortunately seriously injured the foliage of the trees. The steps in perfecting this method of Prof. Coquillett's were many. Mr. A. B. Chapman and Mr. Titus of San Gabriel became impatient and requested Prof. Hilgard of the state university to send a chemist. In April, 1887, Mr. F. W. Morse was delegated for this purpose and he too discovered the efficacy of hydrocyanic acid gas. Later the state university issued Bulletin 71 written by Prof. Morse, from which Prof. Woodworth quoted liberally in his historical sketch. About that time the department recalled Prof. Coquillett from his investigations. He remained in California, however, and in connection with Alexander Craw continued the experiments in fumigation. His idea and that of Mr. Craw was doubtless to perfect a method which could be patented and prove a source of revenue. The introduction of the vedalia proved the solution of the white scale problem. In the section which is now Orange County another insect pest had been proving fully as disastrous as had the white scale about the city of Los Angeles. Dr. Wall and A. D. Bishop were using fumigation in the effort to subdue the red scale which was not only sapping the life of the trees but ruining the fruit. In the fumigation investigation it was found that on very bright sunny days the injury always present was more severe. This caused them to believe that the sun's rays were the cause of injury rather than the gas. Opaque tents which kept out the light were tried and a measure of success was secured. Then came the woman to the scene and Mrs. Bishop asked why, instead of going to the expense of making opaque tents, they did not do their work at night and that was

the beginning of successful fumigation.

For more than a quarter of a century the method of creating gas by putting together in one vessel under the tent sulphuric acid, water and dry cyanide has been followed, in spite of the fact that one of the first appliances tested out by Professors Coquiliet and Morse was the use of a pump to carry gas from the generator outside of the tent through the tent, pumping the mixture of air and the gas from the tent over this generator during the period of gas generation. This was soon set aside for the method of placing the vessel under the tent.

Now comes the fumigation machine, tested for the last two years, and for more than one year used in practical work. The machine used last year was known as the "Owl." This year another has been introduced, working on a somewhat different principle. This is called the cyanofumer. Two other forms of machines are being recommended and it is possible models will be made and their efficiency tested. None of these machines contemplate the pumping of gas into the tent but the generation is outside and the gas is propelled into the tent by its own explosive force.

Prof. Woodworth's sketch was made most interesting by slides showing the fumigation process as carried on in 1898. The photos were taken by J. W. Mills, at that time superintendent of the Pomona experiment station. Both the method of throwing sheet tents and the hoop tent methods were shown. Unfortunately, there seem to be no photos of the old-time derrick method of throwing the tent, as followed by Messrs. Bishop and Wall.

Chemical Injury

In Prof. Woodworth's next lesson the matter of cyanide injury was taken up. There are three types of injury, tip burning, dropping of mature leaves, and pitting of fruit.

Tip burning is caused by the cyanide or perhaps too strong dosage. In discussing this matter Prof. Woodworth referred to the activity of the gas with vertebrates, that is the higher forms of animal life are almost instantly destroyed by it. Scale insects are longer in being affected though flies and the more active insects show the effect much more quickly, being almost instantly killed. With many insects it is thought that the gas has more of a stupefying effect. Some forms of vegetable life are found to be more sensitive, for instance that in greenhouses, than insect life. The orange tree is fairly resistant but the tender tips suffer as a result of strong dosage.

The cause of leaf dropping is not definitely known but is more frequently observed in trees which are in poor condition.

Fruit pitting is sporadic, has caused great loss and is sure to cause contention when under discussion for there are differences of belief as to the reason for it. Prof. Woodworth's belief is that it is caused by free acid which certain atmospheric conditions permit to be carried with the gas at the time of fumigation. This acid he maintains is carried much the same as the mineral salt is carried in the sea fog, often for a distance of miles inland. In the laboratory experiments following his lecture Prof. Woodworth subjected several ripe Valencia oranges to treatment with acid. The "pits" produced seemed to be identical with those which are often showed in orchard practice. Four other theories as to the cause of pitting are that it is due to water which may be formed on

the fruit during fumigation, to mechanical injury such as scraping of fruit with tent carrying sand in its meshes, to lack of cyanide in the mixture generating the gas, or to residue left in the pots. Prof. Woodworth said that this residue would readily cause the pits but he maintained that it was because of free acid which it contained. The only suggestion made for prevention of this injury was for fumigators to be provided with litmus paper and carefully observe conditions during the whole process. As soon as tents are pulled from the trees if any drops are forming on leaf or on fruit blue litmus will determine as to whether it is acid. If it is acid fumigation should be stopped at once.

We may add here that Prof. Woglum, carrying on investigations under the direction of the department of agriculture, maintains that it is not the acid but the cyanide which causes these spots.

Mr. Robinson and Mr. Smith of Pomona both referred to an orchard which had been sprayed with a commercial lime-sulphur solution and had fruit pitted until it was of no commercial value. Others referred to the fact that some cyanides cause greater injury than others, still others to the fact that on foggy nights when tents have picked up moisture until they are almost airtight and hold a stronger solution of the gas the pitting is still more observable. Acids of different kinds have been observed to show more or less of this injury. It has been thought that machine fumigation would result in a lesser degree of injury but it is still observed.

In another lecture Prof. Woodworth demonstrated the various methods of estimating or of measuring the contents or surface of the tree. Mr. F. W. Braun gave methods of manufacture of the chemicals used in fumigation, the chemical action, and many other technical features of this important work were tested during the entire week. It is impossible to touch upon them all but we believe it is a most important week in the history of fumigation.

EXPERIMENT STATION WORK

A farm paper or an educational system which aims to reach farmers in all sections of California has before it a serious problem. There are all conditions from the perpetual snows of the mountains to sections of most intense heat far below the level of the sea. The experiment station of this state has endeavored to meet these conditions by establishing branches where the need is greatest. One of the most serious problems has been that which has confronted the desert farmer. He has gone into a section where agriculture has not been tested until a very few years ago. In the southeastern part of the state is a great section of some of the richest soil in the world, with an abundance of water but with intense heat through the summer months. This section has proved wonderfully productive but at the same time efforts to produce certain crops have brought disaster in their wake. In this far-away corner the state experiment station has established an experimental farm under the direction of Experimental Agronomist Walter E. Packard and it has proved most helpful to Imperial Valley farmers. On this experimental farm have been planted many crops which have succeeded, perhaps more which have failed, and in these successes and failures there

have been lessons for the farmers.

Of course there are being tested tree crops which will require years to demonstrate adaptability or non-adaptability to the section. Perhaps

At the top, reading left to right: John Waterman, Imperial Valley farmer; Walter E. Packard, Agronomist; Frank Viehmeyer, Irrigation Engineer.

The center picture shows shelter for thermometer, in front of it a rain gauge, and in the foreground an evaporation gauge. Reports from these instruments which are furnished by the weather bureau are made to the central office in Los Angeles regularly.

The bottom picture shows the growth in the Imperial Valley of the Imperial Japanese morning glory. Regarding this Mr. Packard writes that it does exceptionally well in this section, growing very rapidly and making an attractive appearance.

the most extensive experiments are those being made with different varieties of dates.

We give on this page illustrations taken on this experiment farm.

BELGIAN GARDENING

Written for California Cultivator
By Special Contributor

The war in Europe has undoubtedly destroyed the wonderful market gardens around Brussels, Liege, Ghent and Antwerp. These gardens were two to three acres in extent and three or more men per acre were employed in the cultivation of the land. Much of the land was under glass. The land in these garden tracts rented at from \$25 to \$40 per acre. The cost of fit-

ting them up was from \$60 to \$125 per acre more, and the yearly cost of manure from \$25 to \$75.

What wonderful things these thrifty and wise gardeners could do on our rich river bottom lands with our mild year-round climate as compared with that of northern Europe.

Before the beginning of the war there was a movement well under way to bring much Belgian money and a great many good Belgian farmers to California. When this plan was being discussed the people from Belgium were quite positive in their statements that the people to be brought here should be carefully selected in Belgium—that there are "undesirables" there just the same as here. Only good farmers, with big families and all willing to work, were to be brought.

All of which brings to mind the thought that the "Bring the Belgian Here" program now being discussed requires careful thought and judgment.

READ-MILLER

European Wheat

FREE 80 acres or as much more land
as you use now for Wheat, Rye, Barley, and Oats, and it is just as good land as you are farming to-day and you do not even have to pay taxes on it.

It will be easily found between your present Wheat or Oat rows, 7 inches or 8 inches apart, by our Modern 3 1/2 inch Drill.

European Farmers raise 60 to 80 bushels of Wheat per acre. American Farmers raise an average of less than half this much per acre.

This great difference is caused by the difference in seeding.

European Drill rows are only 3 1/2 inches apart.
American Drill rows are 6 to 8 inches apart. See the waste of American land.

Double your Wheat and Oats yield with Fetzer's Modern 3-inch Drill

making a furrow three times wider than other Drills broadcasting the seed under the surface, producing deeper roots, sturdy growth; utilizes the space between the rows and saves the waste land.

Fetzer multiplies your Crop yields and makes a good stand of clover with wheat in the driest years.

Write for our 25 per cent guarantee. You cannot afford to waste half your land. Write for literature and Guarantee to-day.

KEEP A LOOKOUT FOR PEAR BLIGHT

Written for California Cultivator
By Sacramento Valley Contributor

A GOOD many pear trees have been set out in California during the past few years; lots of them are now one and two years old.

Ordinarily pear blight does not show up much before trees are three or four years old, or until they produce considerable bloom, and most pear planters figure that they have the first few years free from trouble.

It is well, however, to keep a continuous lookout for blight from the time growth begins the first year.

In one two-year-old Sacramento Valley orchard which is planted on new ground, as far as orchard trees are concerned, and where the nearest pear trees from which blight could have come are at least five miles away, a tree was discovered that was blighted almost to the ground. And this in an orchard that receives the best of care and attention, where it would be expected that the first sign of blight would be noticed.

It just goes to show that a pear orchard must have constant attention and inspection. At least once a week some one should go through a young pear planting and take a look at every tree. This might be done constantly every week during the growing season for one, two or three years, without finding a blighted twig, but at any time during this period he might find a piece of blight and save at least one, perhaps many, trees.

Blight should be cut out as soon as discovered, taking care to cut well below the diseased part and disinfect the knife or shears after each cut. The blighted limbs should be carefully burned.

NURSERYMEN'S ASSOCIATIONS (Continued from Page 171)

general discussion was given to the matter of transportation we quote from the report of Mr. Roeding, who is a member of the regular transportation committee:

"Following the instructions of the convention, the Fancher Creek Nurseries adopted a follow-up plan with all the freight shipments made in the winter and spring of 1915. Arrangements were made with the interstate commerce bureau, Los Angeles, to co-operate in this matter. The total number of shipments made by rail during the season was 6,129. With each shipment made the following notice was pasted on the invoice:

NOTICE

It very often happens that incorrect rates are applied on shipments of nursery stock. To protect our customers' interest we have arranged with the Interstate Commerce Bureau, No. 438 Bradbury Building, Los Angeles, California, to check up all freight. We will appreciate it if after paying your freight bill you will mail it at once to the address given. In case of an error a claim will be entered on your behalf.

Only 57 customers out of this number mailed their expense bills to the bureau, and of these there were 12 in which errors of billing had been made. The largest claim was one of \$6.29 in

a shipment made to Texas. The total amount of all the claims was \$15.37. The response on the part of customers was disappointing, but if they were not sufficiently interested they were the ones to suffer for the nursery had used its best endeavors in their behalf. If nothing else was accomplished it at least demonstrated a plan by which the nurserymen could protect their customers from being overcharged, and for nurserymen, particularly those who are located outside of California and who make it a business to sell exclusively through agents and make delivered prices, an institution conducting business along the lines of the interstate commerce bureau would be the means of saving them a great many dollars undoubtedly on their shipments.

"All claims are paid by the consignor by check from the railroad companies and one-half of the amount received is paid to the bureau for its service.

"Your committee would recommend that other nurseries follow out this plan of procedure."

Regarding classification of nursery stock Mr. Roeding referred to the efforts of Mr. Merriweather and the fact that he had secured a number of new classifications which were saving much to nurserymen. Especially has there been a saving in the matter of balled citrus and ornamental stuff. The former rate on this class of goods was absolutely prohibitive to some points.

Regarding uniform legislation State Horticultural Commissioner A. J. Cook presented his views:

"I still hold that legislative action should center in the state officer, that laws should first protect the actual grower, the producer, after which every possible energy should be used to foster other industries and aid citizens of all states of our country. We should all work to procure wide and thorough inspection that insect and fungoid pests may be suppressed. At present we must submit to double inspection as we cannot trust to inspection at the initial point, but the logical course would be one inspection at the point of shipment, and we hope that at no very distant day, at least in the state, one such inspection will be performed so thoroughly and conscientiously that all will respect it and ask or wish for no more. Within the state, if the entire service is centered in one competent, wide-awake, untiring and conscientious official, might we not hope that very soon we could realize this very desirable improvement in our service.

"Once more, the action of our West Coast Nurserymen in their arduous labor to secure a general law that would be so elastic as to be adaptable to every state, when amended to meet local needs in each case, their evident fairness and desire that all should have a square deal in their endeavor to frame an act that would be fair to all and safeguard all parties, growers as well as their own confreres, prove that they only wish what is just and equitable to all alike."—M. C. H.

From the many excellent addresses of a general nature made before the convention we quote one entire, that of Mr. Almon Wheeler, of the Santa Clara Valley, this state. We choose

this one because no other horticultural topic is of more widespread interest at this time from Vancouver to San Diego than is the walnut.

* * *

THE WALNUT

By Almon Wheeler

All things considered, there is nothing along the line of endeavor in horticulture with a more promising future than the walnut.

To the intending planter, whom the bugbear of over production may incline from the standard fruits which have been and are being planted so extensively each year, we suggest that he meditate seriously upon the walnut and be convinced that he may expect as good results from his labors and as reasonably large financial returns as from any other.

Along the Pacific Coast there is such diversity of soil and climate that it is possible to grow all the fruits and nuts of the temperate, many of the semi-tropical countries, and perhaps some few of the tropical. This being true why should we incline too much to the same thing?

That the walnut has succeeded is proven by the great orchards of the South which have been producing profitable crops for many years past and according to reports will surpass all records for the state this present season. To show how the state authorities at Berkeley regard the walnut we quote from their bulletin No. 231, a book of 400 pages: "The present bulletin represents the results of the most extensive, and perhaps the most important investigation undertaken by the department of plant pathology since its formation." Then again from the same bulletin: "Under favorable and normal conditions walnut growing is one of the most attractive horticultural pursuits which can be imagined."

The trees require comparatively little care compared with citrus fruits and they are subject to comparatively few pests or diseases. The price of the crop has been almost invariably good and first class walnuts have always sold readily and at excellent prices. The product is not subject to decay, freezing, or other dangers which are common to most fruit crops. No unusual skill is required to conduct a well established walnut grove, and all in all this crop is, as said above, perhaps the most attractive and the best adapted to the average settler coming to California where favorable conditions for its production obtain.

This paper is not written by one possessed with expert and technical knowledge nor one who by close study and investigation is ready to announce anything new or startling, but rather by one who has planted the young tree, cared for it from infancy to the bearing age, and who looking back can profit by mistakes and proffer when wanted a little advice to the beginner. Nor will we attempt any lengthy discussion of varieties, rootstocks, pruning or the lack of pruning, etc., for you will find as many different opinions as there are owners of walnut orchards, but will merely touch upon the subject in a general way.

Though walnuts like many other fruits may live and grow on indifferently to a somewhat uncertain maturity in various locations, it is equally true that they succeed in some localities and soils better than in others, and as we all plant orchards with the expectation of profitable returns, it may be taken for granted the intending planter has satisfied himself that he has made a wise selection of both and has the necessary moisture conditions, either naturally in the soil or to be

obtained artificially by irrigation. These are the first and vital requisites, and after them comes the selection of variety or varieties.

By far the larger number or we might say practically all the orchards of the south are of the improved seedling varieties of the English nut. These have been and are subject to great loss from the blight, for which there is no adequate remedy known up to the present time. It is thought by many that the late blooming French varieties, grafted on the native Black root are immune to this, and our experience in Santa Clara County tends strongly to confirm this belief.

This past winter of heavy and continued rains and the cold damp spring have been very favorable to the infection, and in the seedling English trees, though heavily loaded with nuts, the crop will be practically worthless as the proportion of light nuts will be so large that it will be very difficult to interest buyers in such stock.

These conditions are responsible for the slight indication of its appearance in the French, and it follows that the same conditions are responsible for its unusual severity in the seedlings, but they are affected more or less every season and are very uncertain.

Then the late blooming qualities of the French sorts will appeal to the careful planter, starting as they do from April 15 till along the middle of May, according to the locality, escaping the danger from late spring frosts that are often the undoing of the less favored varieties. Another very important feature of the walnut arises from the fact that those on the Black California root can be successfully grown where other trees have died from the oak fungus, and many orchardists are now thus planting, finding it fruitless to replace with the same tree or others subject to the fungus.

As regards bearing, it may be that the seedling will eventually become the larger tree and a heavier bearer, but with the larger nut, superior flavor, light colored shell and kernel and higher market price, the Franquette and Mayette type greatly excels and is the only safe and profitable one to plant in Central California.

If you have heretofore doubted, from ignorance or habitual scepticism, the bearing qualities of the French, assure yourselves from the San Jose Mayette orchard of Mr. Wiltz, the Franquettes of Judge Leib, the George Payne orchard, the home of the famous Santa Rosa tree with a record of 712 pounds of nuts in one year's crop, and even the modest young orchard of the writer at Morgan Hill, and you will see trees with such loads of the finest, largest nuts, that you will all become enthusiastic boosters for the walnut.

As for soils, a deep, warm, strong, well drained soil is the ideal, but that they will grow and bear profitably elsewhere is proven by the trees we see in black, heavy adobe and in soils that were once thought adapted for grapes only.

Did you ever see a roadside avenue of walnuts and note the tree opposite the house, where it got the surplus water from the lawn, how much larger, stronger and better filled with nuts it was than the rest? Then plenty of moisture but no hardpan to hold water and rot the roots.

As to overproduction, that spectre that seemingly haunts the citrus man, the prune man and others, the walnut man may not fear for a long time to come, as statistics show that with a steadily increasing consumption only about 30 per cent of the product is produced in the United States, which means the Pacific Coast and, perhaps we had better say, California. The plantings of walnut trees in past years, though considerable, are insignificant compared with plantings of other fruits, and with such limited plantings it will be foolish to worry about too much of a good thing. When the Franquette and Mayette and kindred

varieties are grown in sufficient quantities to be offered in all the markets of the country, such a demand will be created that it will be limited only by our ability to supply and the power of the consumer to buy.

Let us quote from a letter written to us by a man of wide experience and connected with one of the leading fruit industries of the state: "The sack of walnuts (Franquette, 100 pounds) arrived in due time and they have been an absolute revelation to us, being far and away the best walnuts we have ever seen. There is certainly a big future in the walnut industry if such walnuts as these can be produced. We have not known that there were such walnuts."

We may add that this same gentleman has already placed an order with us for 150 pounds of the coming crop for his personal use.

Isn't this creating a market?

STATE ASSOCIATION OF NURSERYMEN

Fred H. Howard, president of the State Association of Nurserymen, presided at the state sessions. In his opening address he took exceptions to the conduct of the state horticultural commissioner's office, and said: "As regards the parcel post, the nurseryman has been deprived of it as a means of transacting business. The system of enforcing inspection at the point of arrival, and obliging someone to pay extra postage after the shipment has been examined and re-packed is detrimental to us."

On this latter topic former President Coolidge made an address. He touched upon the impossibility of shipping plants under the present postal regulations of state inspection. The re-packing and re-shipping made necessary by the regulations mean the destruction of many of the more delicate plants. Mr. Coolidge closed by saying:

"The florists and nurserymen do not object to the state inspection of their crops in order that a clean bill of health may be had. They know well enough and appreciate fully the value of cleanliness without which healthy growth and the best results cannot be expected. Moreover, without a strict system of inspection under government control the man who took pains to keep his nursery or plant establishment clean would often find that a careless neighbor would to a large extent upset his labor by not spraying or operating against the diseases or insect pests upon his stock. State inspection is necessary in a country like ours and indeed ought to be enforced in all lands where advanced cultivation exists."

"What the trade does object to, however, is, first, incompetent inspectors and those that are tactless—and both are perhaps common enough; second, the really silly rules, regulations and orders such as are issued from time to time by goodness knows who. The post office order is a trade-strangling, impracticable, perfectly inane piece of official ruling. Can there be no appeal?"

The committee on nomenclature, consisting of Messrs. Branton, Clarke and Armstrong, reported as to the adoption of the code of the American Pomological Society, reporting also as to progress made in the endeavor to work over a list of California trees which should be submitted to the American Pomological Society and approval for such list secured. The committee also recommended that this work be carried on until the desired list is secured.

"We recommend to the incoming committee for 1916 the compilation of a complete list of fruit tree names found in catalogues of firms selling stock within this state, or in lieu of such action it might be still better to have appointed a special committee to appear before the convention of the American Pomological Society, which convenes at Berkeley, September 1-3, to secure their aid and cooperation and at once compile such list, that it may be officially adopted and sent out by the secretary to all members before fall catalogues are printed. The way to adopt is to adopt."

Receptions were tendered, which with special days given over to the nurserymen at the Panama Pacific International Exposition made this fifth convention of the State Association of Nurserymen one of pleasure and of great importance.

20% More Than Was Demanded Of It

W. H. H. Garver of Perris had the power problem to solve. Conditions on his ranch were rather difficult. After investigating in conjunction with his engineer the various makes of engines on the market he settled on two makes—the

—and the Commercial. After two months of effort the Company was unable to lift the amount of water required. Mr. Garver then installed a Commercial Gas Engine which not only met all of his conditions but pumped 20 per cent more water a minute than he had demanded. Write for Mr. Garver's full testimonial, and catalog 18-C.

ON SLUGS

Written for California Cultivator
By T. R. Woodbridge

WONDER if the following data will be of interest to those of your readers who have a garden? I have read everything I can find on how to kill slugs and finally decided to make a few tests myself, after a rather terrific fight during a bad invasion. By "slug" I mean the thing that looks like a shell-less snail. I take the following from my notes:

Experiment No. C-25

Subject, Slug, 6 inches long when crawling.

Placed in a shoe box containing wet sand and covered with wire screen.

First day—No food.

Second day—Lettuce leaf heavily

NAMING GARDEN VEGETABLES

Report of Committee on Nomenclature and Varieties as Adopted by Vegetable Growers' Association of America

(A) Kind: The term "kind" as herein used shall be understood to apply to those general classes of vegetables which are grouped together in common usage without regard to their exact botanical relationship—as tomato, cabbage, kale, pepper, cucumber, etc.

(B) Variety: The word "variety" shall stand for plants of the same kind which show a common tendency towards the same characteristics and variations in habit of growth and of market product, independent of the immediate heredity or the effects of local climatic and cultural conditions.

THE MOST ECONOMICAL WEED KILLER

covered with arsenic (white oxide). All eaten that night.

Third day—No food.

Fourth day—Lettuce leaf heavily covered with corrosive sublimate (bichloride of mercury). All eaten that night.

Fifth day—No food.

Sixth day—Lettuce leaf covered with calomel (monochloride of mercury). All eaten that night.

Seventh day—No food.

Eighth day—Lettuce leaf covered with strychnine. All eaten that night.

Ninth day—No food.

Tenth day—No food

Eleventh day—Lettuce leaf covered with cyanide of potassium (about one-tenth of a teaspoonful). Piece of about one-quarter inch in diameter eaten by morning.

Twelfth day—No more eaten. Slug crawled out of box during night, and for ten feet along bench and then crawled into box again, as shown by slimy trail and loosened cover.

Thirteenth day—All leaf eaten.

Fourteenth day—No food.

Fifteenth day—No food.

Sixteenth day—Unpoisoned lettuce leaf, eaten greedily in short time.

Seventeenth day—Tempted to free the slug, but prudence prevented, as the strain proved too resistant. Sprinkled with salt, but too slow, so smashed him, or her, with a piece of board. Slug dead.

This probably explains why the attempt at poisoning in the garden failed. Have found caustic lime to work as long as fresh. But the best plan I have found to be that of hunting with an electric glow lamp after 10 p. m. and dropping the game into a pail of gasoline. Some toads we have acquired are helping considerably.

(C) Strain: Shall stand for plants which are vegetative parts or the lineal descendants of some plant which showed to a noticeable degree the habits of the variety or of one or more of its distinct characteristics and an ability to transmit such characteristics.

(D) Stock: Shall stand for plants of the same variety, strain and heredity, or when used with a possessive, to those grown by or under the immediate supervision of the same individual or firm.

(E) Sample: Refers to a small portion of a variety, strain or stock which represents the average quality, uniformity, mechanical purity and cleanliness of a given lot of seed or plants.

Registration

(A) The Vegetable Growers' Association of America should maintain a registration bureau which shall act in cooperation with similar committees of the American Seed Trade Association, American Pomological Society, Nurserymen's and Florists' Associations, and other similar societies to secure uniformity in rules and practices of varietal nomenclature and registrations.

(B) The listing of proposed introductions and novelties by the originator or discoverer shall be encouraged in every way.

Naming

(A) The paramount right of the originator, discoverer or introducer of a new variety, strain or stock to name

it, within the limits of this code, is recognized and emphasized.

(B) No two varieties of the same kind of vegetable should bear the same name. The name first published for a variety should be the accepted and recognized name, except in cases where it has been applied in violation of this code.

(C) Where a given variety name through long usage has become thoroughly established in American horticultural literature for two or more varieties, it should not be displaced or radically modified for either sort, except in cases where a well known synonym can be advanced to the position of leading name. The several varieties bearing identical names should be distinguished by (1) adding or prefixing the name of the originator, discoverer or introducer or the author who is first known to have described it, or (2), by using in like manner some distinguishable term that will insure their identity in catalogs and discussions.

(D) Existing American names of varieties which conflict with earlier published foreign names of the same, or other varieties, but which have become thoroughly established through long usage should not be displaced.

(E) That name of a variety of vegetables should consist, if possible, of a single word, and in no case should it consist of more than three words, including that of the originator, discoverer or introducer, in case the latter is to be incorporated in the name.

(F) In selecting names for varieties, the following points shall be emphasized: distinctiveness, simplicity, ease of pronunciation and spelling, indication of origin or parentage, or some readily distinguishable characteristic.

(G) No variety should be named unless distinctly superior to existing varieties in certain important respects, or until it has been determined to retain it.

Tests

(A) Authorized reports of comparative trials of any proposed introductions should be secured, horticulturists of the U. S. department of agriculture and of any state agricultural college or experiment station being ex officio authorized to make such reports.

(B) In the case of samples voluntarily submitted for trial all information concerning the same should be held strictly confidential until it has proved or disproved its claim to registration. All material submitted for test shall be used for that purpose only, except where written consent has been given to the contrary by the party or parties submitting the same for test.

(C) Varieties voluntarily listed for testing shall be exempt from publication if the party or parties listing the same shall so desire, provided no effort is later made to introduce the variety in disregard of this set of rules, in which case the committee shall be authorized to publish the name of the parties from which the sample was obtained with the reason for refusal to register it.

(D) Existing varieties shall also be tested in comparison with each other. Where those of recent introduction are found alike, the originators or discoverers shall be urged to agree upon a common name. Where a recent introduction is similar to a fully established variety it shall not be recognized as a separate variety, but the facts shall be reported as hereinafter provided.

Publication

Publications concerning recent introductions and sorts proposed for registration shall be made in some prominent horticultural periodical.

In cases where registration is allowed such a publication shall consist of an accurate definition of its distinctive characteristics and merits in comparison with related varieties, the name of the originator or discoverer, and time and date of introduction. If no satisfactory complaints are lodged against the same within one month from date of publication, the variety shall be considered as formally registered.

Gravenstein Apple Show At Sebastopol

Great Throng Gathers on Opening Night to Usher
in the Sixth Annual Event. M. C. Holman
Writes of the Show for Cultivator
Readers.

It was a beautiful sight that greeted the eyes of the thousands of visitors on the opening night of the Sixth Annual Gravenstein Apple Show at Sebastopol. The great tent was brilliantly lighted and hung with festoons of varicolored ribbons which formed a charming rainbow canopy under which the art and magic of the Gravenstein found its most pleasing expression.

It was beautiful music that greeted the ears of the visitors, for Patriarch's Military Band of Petaluma rendered a program of classic and popular selections.

It was a happy throng that wended its way through the great aisles lined with wonderful constructions in apples, and that felt the thrill of exquisite beauty everywhere.

Sonoma County was not thought of as a great apple growing section back in 1876, for it was then that the giant redwood claimed the wealth of fertility. There were at that time seven large saw mills which were fast reducing the great trees to commercial lumber. And old settlers looked with sorrowing hearts to see the landmarks passing. There seemed nothing to take the place left vacant by the hewing of the forests. But gradually Gravenstein trees were planted. Soon they began to produce fruit, and this fruit came earlier in the Anale Valley than elsewhere in the state. The opportunity was realized and thousands of trees were planted, land values advanced, and in this section, where once the giants of the forest held undisputed sway, were now thriving the little trees with their luscious fruit.

And the Gravenstein has continued to be the main object of cultivation and development, until at the present time there are thousands of boxes shipped from the Sebastopol section every year.

The first thought of giving a Gravenstein exhibition came to the minds of the prosperous people of Sebastopol in 1911. They saw that they would have a good year and realized that the greatest good they could do for themselves and for Northern California would be to let the people know of the fruitfulness of their wonderful soil.

And so the first show was launched under the watchful eye of Mr. J. P. McDonnell and Mr. Edward H. Brown, who have been two of the foremost boosters for Sonoma County and Anale Valley. It was a marked success, in fact so great was the interest shown that the Gravenstein Apple Show Association was formed and the determination made to have the exhibit an annual event. This plan has been carried out, and the Sixth occasion finds greater development in beauty and utility than ever before.

The Gravenstein Show is always made up of wonderfully conceived and carefully executed designs. Fancy goes the limit, while perseverance and energy seem to have no limit. First and foremost in this present exhibit is the Liberty Bell, that emblem of

American freedom which is loved by every one, whether found at Old Independence Hall, Philadelphia, at the Pennsylvania Building at the Exposition, or at the Gravenstein Show.

The Living Tower of Camp Meeker stands as the skyline construction. It is five apple stories high and reaches to the apex of the mammoth tent.

As a fitting honor to Mr. Burbank his home is excellently reproduced by the Santa Rosa Chamber of Commerce,

Liberty Bell Feature, One of the Most Attractive at the Apple Show

the artistic work being in the hands of that body.

The Fountain, with its sparkling life and vibrant activity, centralized by a revolving double star, is easily one of the leading features.

The Merry-Go-Round, which earned its name, is the cynosure of all young eyes, and we doubt not many of its youthful admirers would gladly have chanced a ride in the commodious chairs.

The coolest and most restful spot is that offered by Mr. F. H. Grohe of Santa Rosa. His moss covered pergola, with its ferns and beautiful flowers, at once suggested the idea of perfect rest and contentment.

The Japanese Tea Garden, fashioned by Mr. B. A. Crabtree, is a really appetizing work and only lacks the dainty maids of the Orient and the fragrance of the tea to make it in actuality what it is in apples.

There is also the practical side, the car load exhibits, both in boxes and wagons, together with various products of the apple such as jellies, jams and pies.

An added feature of this season's exhibit is the display of poultry given under the auspices of the Sonoma County Poultry Association, and the interest shown for the birds gives assurance that this feature will be made a part of each future show.

It would be unfair to horticultural and agricultural skill if we failed to mention the exceptionally commendable work done by the Hallberg Ranch. This ranch is situated about three miles from Sebastopol and comprises 126 acres. For diversity of products we do not believe it can be excelled. As an example of what may be done on one piece of ground the following

specimens were on exhibition, showing the great variety of production from this one ranch: Thirty-four varieties of apples, 7 varieties of peaches, 8 varieties of berries, 10 varieties of potatoes, 13 varieties of corn, 5 varieties of plums, 3 varieties of pears, 4 varieties of cherries.

Adjoining the main tent is the commendable spray pump exhibit of the Bean Spray Pump Company of San Jose. This enterprising concern, which recently suffered a very serious fire, is always on hand to show its excellent methods for eradicating insect pests of all kinds.

We can hardly think of a more completely satisfactory apple show. Nothing is overdone. There are no fakirs, which sometimes disgrace an exhibit of this kind. Every effort has been put forth that the worth of the Gravenstein apple may be made known and that the land of its nativity may be held in pleasant memory by all visitors.

PRUNE CULTURE

(Continued from Page 171)

very dark and dirty. Those new to the business should visit some of the best prune curing plants before their own crop comes on. Directions may be followed ever so carefully, but only experience, expert knowledge, can determine the exact strength of the lye as well as the proper consistency of a well-cured prune. The skin of a prune must be well wrinkled when it comes out of the lye bath, but it must not be broken or show the least sign of peeling. If it does the solution is too strong or the fruit has been held in it too long. Robe de Sergeant and Imperial prunes are both more liable to bruise than the French, therefore more care should be used in their case to see that the ground is smooth and soft. The solution must be kept actually boiling, which makes a tubular boiler a necessity. It pays to use the most up-to-date methods and to use more care in every detail. Prunes, as all other fruits, are better when cured slowly. A few days or a week exposed to the hot sun, and then it is well to stack the trays. Judgment must be used at this point, as previously, for if the weather is cool, or if an early shower should be threatening, it would be safer to keep them on the trays until dry enough to box. Do not let the prunes get too dry so that they "rattle," but they must not be so soft that any of the pulp can be squeezed out; the meat must be tough all through.

Large prunes, especially Imperials, require turning while on the trays; this is easily done by using lightly an ordinary broom. This prune should be picked at least every other day, and in hot weather daily, as it will soon show dark spots in the flesh if exposed to the sun on the ground before dipping. It really requires expert handling to make a first-class article of Imperials, which then is worth 10 cents or 12 cents a pound, so the extra time spent on it is well invested.

The practice of shaking prunes onto a canvas is not to be commended. The temptation to clean up the crop at one job is too obvious, and this haste is of all things to be avoided; let the fruit drop naturally.

Ripe prunes, properly handled, while not black when they are dry, will become so in the bins, where they undergo a process of "sweating" for a week or two. They are then graded by machinery and packed as the market requires. Before packing prunes are often dipped in a weak brine, five pounds of salt to 100 gallons of water, which cleanses them and aids in bringing out a rich, black gloss.

Large prunes pitted, or pitted and stuffed with nut meats, and packed in fancy cartons, will some day become an extensive commercial product in California. A few years ago the writer paid as high as 60 cents for a half-pound tin of Imperials, pitted, in the town of Agen, France, the center of the prune industry. The fruit was deliciously tender, and a most superb confection. To the present time no effort, or very little, has been made at home to prepare fruit for the markets that will take such goods. We import them. This should not, and need not be.

HE ADMIRER HER JUDGMENT

She—Oh, Fred, dear, you are so noble, so generous, so handsome, so chivalrous, so much the superior of every man I meet, I can't help loving you. Now, what can you see in plain little me to admire? He—Oh, I don't know, dear, but you certainly have very good judgment.—London Tit-Bits.

FLORIDA MOTORIST SUGGESTS ROAD RULES FOR LINCOLN HIGHWAY

Evidently the road rules in the Evglade state are not favorable to the motorist. At least the tourist who sent in the following suggestions to the Lincoln Highway Association as rules of the road to be observed by the thousands of transcontinental tourists of this summer must have had some bitter recollections.

Upon close inspection it will be seen that a gentle vein of satire prevades the suggested list. This motorist says that they are the general rules which must be observed about Jacksonville and, if they are successful and popular there, why not along the Lincoln Highway?

Rule 1—Upon discovering an approaching team, the automobilist must draw to one side of the road and cover up his machine with a tarpaulin painted to correspond with the scenery.

Rule 2—The speed limit on country roads this year will be secret, and the penalty for violation will be \$10 for every mile an offender is caught going in excess of it.

Rule 3—On approaching a corner, the automobilist must stop not less than 100 yards from the turn and the mechanic must be sent ahead to blow a horn, ring a bell, fire a revolver and send up three rockets at intervals of five minutes.

Rule 4—Automobiles running at night must send up a red rocket every mile and then wait ten minutes for the road to clear. They may then proceed carefully, blowing their horns and shooting Roman candles.

Rule 5—In case a horse will not pass an automobile in spite of the tarpaulin, the automobilist will take the machine apart as rapidly as possible and conceal the parts in the grass.

John Deere Implements

A New Book
Free

Just Off the Press

Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions. It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements: Steel plows, cultivators and harrows; corn planters, disc harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side delivery rakes; motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasoline engines.

To get this book free, state what special implements you are interested in and ask for the book as Package No. X-111.

John Deere Motor Press

The Press with the powerful eccentric gears. Gears are mounted off center, giving more power on the working stroke, a quicker return of plunger and very desirable action of the self-feed—the three points of prime importance.

Easily bales 2 to 4 tons per hour without any jar or shock.

Powerful self-feed arm and plunger, improved form of drop blocker and automatic tucker insure well shaped, firmly packed, smooth end bales,—the kind that bring the highest price.

Entire outfit is always ready for work. No lining up of engine required.

Wide track front axles with a fifth wheel is why this press stands up so well and is so easily moved.

Made in three sizes for 14x18, 16x18 and 18x22" bales.

Write if interested in Hay Press, Loader, Stacker, Side Delivery Rake or other hay tools—and ask for free book, "Better Hay—How to Make and Market It".

Van Brunt Single Disc Grain Drills

Plant any small grain, from alfalfa to bearded oats, corn and peas, even in trash, gumbo or mud.

Van Brunt Drills never choke. Adjustable gate force feed compels an even, continuous flow through each seed tube. Amount sown regulated simply by moving a lever.

Seed is planted at even depth. Individually adjustable springs enable you to give each furrow opener the required pressure for hard or soft ground to make furrows of even depth, and the seed is placed at the bottom of the furrows. All of the grain is up and ready for harvest at the same time.

Van Brunt Drills are light weight, light draft, well balanced and strong. Frame is rigid; hopper does not sag; the gear drive is positive (each wheel drives half the feeds) and the disc bearings are guaranteed to last lifetime of drill. Spring steel scrapers keep the discs clean.

Write us for free booklet, "John Deere-Van Brunt Single Disc Drills." It tells why the Van Brunt plants seed at bottom of furrows of uniform depth, and what this means to you.

STATE MARKETING COMMISSION AND POTATO CERTIFICATION

Written for California Cultivator
By Harry A. Chamberlain, Assemblyman from the 72nd District

STATE commission market to deal in agricultural, fishery, dairy and farm products of the state on a commission basis is another creation of the 1915 California legislature.

The state commission market is to be under the management and supervision of a market director to be appointed by the governor at a salary of \$5,000 per annum. An appropriation of \$25,000 was made to establish the market.

Under the supervision of the commission director, depots and stations are to be established throughout the state for receiving and disbursing products from the producers to the consumers. Rules and regulations for the operation and conduct of the market are to be supplied free of charge to the general public.

Under the act passed, all producers of agricultural, dairy or farm products or products manufactured or processed therefrom, or fishery products which are grown, raised, produced, processed or manufactured within the state, shall have the right to consign and deliver their products to the state market at any of its established depots or stations. The market shall sell and distribute the products to dealers, consumers and all buyers to the best advantage of the producer for a small commission to be fixed by the market director.

Another feature of the state market is to be the gathering and disseminating of information on all subjects relating to the marketing of California products in order that the producers, and consumers as well, may keep posted as to the supply and demand and current prices of their products.

It is expected that the market will prove self supporting, as the act creating the new department provides that sufficient commissions for the handling of produce shall be charged to gradually build up a revolving fund to be used for the operation and extension of the marketing system. A standard for California certified seed potatoes is fixed in another bill passed which prohibits the sale of any potatoes as certified seed potatoes unless they have been inspected and certified to in accordance with the following requirements:

The growing potato crop shall be inspected by deputies of the state horticultural commissioner once during the blooming period, again as the plants begin to mature, and again after the crop has been harvested and graded.

Potato fields showing a mixture of more than 250 hills per acre with any other variety or varieties or showing more than 500 weak hills or more than 50 hills affected with blackleg shall be disqualified for certification unless the mixed and weak or diseased hills are removed from the fields under the supervision of the inspector.

At the time of the second inspection the inspector shall dig and weigh at least 100 hills per acre, and if five

per cent of the hills so dug each weigh less than 30 per cent of the weight of an average hill, the crop shall also be disqualified for certification. Disqualification for certification, however, shall not prevent the grower from selling the potatoes, but they shall not be sold as certified potatoes.

After the crop has been graded it shall be inspected according to the following requirements:

The selected potatoes after being graded shall be free from any infestation of eelworms, larva or tuber moth, or infection of wart disease or powdery scab, and shall be practically free from necrosis or infection of late blight. They shall in the judgment of the inspector be free from serious infection of scab or rhizoctonia, with not over five per cent light infection of scab or ten per cent light infection of rhizoctonia. They shall not contain more than eight per cent light infection of wilt disease and not over two per cent of deep infection of wilt. They shall also be free from any mixtures of colors or distinct types and shall be reasonably sound and free from cuts or bruises or second growth, and shall conform in shape to the varietal type. Not over five per cent of the tubers shall weigh less than one and three-fourths ounces and not over five per cent shall weigh more than twelve ounces.

Growers of potatoes which meet the requirements of the act shall be given by the inspector at the time of making the last inspection, a certificate stating that the potatoes conform to the provisions of the law. All potatoes sold as California certified seed potatoes shall bear on the package or container the certificate of inspection, net weight of contents at time of packing, date of inspection, and the date of packing.

FARM BUREAU

Solano County, J. W. Mills, Adviser, Fairfield

The Solano County farm advisor will hold meetings as follows during the month of August:

Rio Vista, August 17.

Vallejo, August 19.

Suisun, August 24.

Dixon, August 26.

There may be special meetings called at Dixon and Rio Vista.

Since the Solano County farm adviser commenced work in March, 1915, several projects have been mapped

out and some have been given a substantial start. A farm bureau swine breeders' association has been formed and is in running order, a campaign against squirrels and obnoxious weeds has been started, demonstrations for improvements in the marsh lands and wheat production in the Montezuma hill country are mapped out for the coming season; a farm bureau colt and horse show will be held at Rio Vista on September 9. This promises to be the biggest event that Solano County has ever pulled off. The board of supervisors gave the local unit \$500 for prizes to those showing the best stock in different classes. The colt and horse show will be the chief event, while water sports on the Sacramento River, a water pageant on the river

in the evening, fireworks and grand ball will complete the festivities of the day.

About 500 tons of alfalfa hay have been disposed of in the Dixon district by the farm adviser, and a movement will be started to form an alfalfa growers' association. A campaign is being started by the adviser to plant the county roads with nut trees. This is to be in conjunction with the thistle campaign, killing two birds with one stone.

The demonstrations in the Montezuma Hills and on the marsh lands are of great importance as they should lead to a heavier production of grain on 60,000 or 70,000 acres of some of the best grain producing land in the state.

heated, made tea in my mess tin, and had bread and jam for dessert.

"The rations are very carefully measured out, so if we have a fair feed one meal the next one is a bit minus. Two or three hard biscuits, half pound bread, a small tin of jam, and a small tin of bully beef per man daily form the menu—forgot the ham in the morning—I never eat it anyway. Down at the base we get cheese occasionally, and tea and stew are made for us. I could drink a gallon of tea every day, but the man says 'No.'"

TIME TO CUT ALFALFA HAY

There is much inquiry on the question as to the proper time to cut alfalfa hay. Experiments carried on by the chemical department of the Colorado experiment station a number of years ago showed that the greatest feed value in a particular crop was present when the crop was in full bloom. It has been worked out, however, that this is not always the best time to cut the crop to get the greatest annual yield. There are two reasons for this; first, if the crop is allowed to go until in full bloom a considerable amount of leaves will be lost in the process of harvesting or drop to the ground before the harvest; second, that the succeeding crops of alfalfa are produced from the crown shoots which put out from the crown at approximately the time of the ap-

pearance of first bloom. If the crop is allowed to stand on the land until full bloom these sprouts which are to produce the next crop are dwarfed more or less and take some time for recovery after the crop is harvested. The time taken results in a shortening of the annual yield. Thus it is possible by cutting the crop when the crown shoots first appear to obtain a heavier annual yield of hay and feeding value than to wait until a little later when the specific crop is at its maximum.

The time then to cut alfalfa hay is when the crown shoots for the succeeding crop first make their appearance whether the present crop is in bloom are not. The only modification to make on this rule is to get a crop which is exactly fitted for some type of feeding. If for feeding horses that are to be on the road to some extent the hay should be allowed to get somewhat riper; but for all other feeding, the above time of cutting is preferable.—Alvin Keyser, Colorado Agricultural College.

"There is no living without women, and to be assigned to one of them and have her contrive that there shall be no living with her makes a serious dilemma."

Most family trees bear more or less nuts.

General Agriculture

GALLIPOLI SIMILAR TO CALIFORNIA

Dr. A. Davidson, always interested in California botanically, sends us a clipping from the Scotsman of July 17 which contains a part of a letter from a soldier in the trenches at the Dardanelles. It has reference which may be of interest to Californians for the writer makes comparison of plants there with those in California:

"Mr. A. Stevenson, printer, Maybole, has received the following letter from his son James, who is a member of the Royal Scots Fusiliers at the Dardanelles:—

"We are standing by just now waiting on the word to move to the firing line, perhaps, and I am taking the chance to write when I have it, as it may not come for some time again. My desk is the back of a shovel and my room part of the rearmost trench. The bullets are whizzing overhead from the front, and our own shells going high over us from the rear. We are all right so long as we keep our heads down, and you may be sure we do so when there is no need to look over the parapet.

"We have had a tremendous time since we left the firing line eight days ago—digging trenches, etc. It's no place for a lazy man, I can tell you. There is a heavy bombardment going on just now, and I would rather be here than in the enemy's trenches. No wonder there is such a call for munitions, when the big guns fire the way they are doing.

"The vegetation here is something similar to my old stamping ground in California, and our present ground is something like foothills. There are lots of sage brush, Johnson grass, Bermuda grass, and fox tails, one or two small family orchards of about a quarter of an acre, and I have seen an odd apricot, persimmon, almond, fig, and quince. I have also heard of some orange trees. The trees are not cultivated the way they are in California, but are just let grow. The well tops and water troughs seem to be hewn out of solid blocks of stone, and the houses built of soft stone of the countryside with mud for plaster.

"There is a lot of water near the surface, and some of it is very good and nice and cold. The fruit is not so far forward as in California, the grapes just now being only half the size of peas.

"Just heard some good news from

the firing line—reported the right has taken two trenches 800 yards apart. Hope it is true. Enjoyed a good dinner today, and am feeling fine just now. Here we get a little dry tea and sugar and make it ourselves. So had a tin of meat and vegetable ration

"Every Day is Bargain Day" to the Man who Buys BUILDING MATERIAL from WHITING MEAD'S Big CATALOG! 1915 Edition is FREE to you—Saves 20% to 40%

\$15 to \$18 Front Doors \$10 Veneered Oak with Plate Glass

—A typical value from our Sash and Door Dept., finest quality veneered oak doors with plate glass panels at top. Secured by special purchases recently and not mentioned in our catalog. All standard sizes and styles. Write for further details.

Screen Doors 25% Off

—New screen doors, the overstock of a famous door factory, made of best selected sugar pine in standard stock sizes. These doors can be duplicated in any first class yard at 25% to 40% more.

Style No. 8, \$1.25

—This door usually sells for \$1.65. Made of clear sugar pine and fitted with black screen wire, like picture, at our price..... \$1.25

Style No. 9, \$1.40

—Made of sugar pine, with three lower panels and fitted with galvanized screen wire. A door that will stand \$1.40 lots of use; our price.....

Odd Doors \$1 and \$1.25

—Inside doors of best sugar pine, 5 panel Colonial and 5 panel O. G., styles a big lot of them, in all sizes.

Oregon Pine \$10 to \$15

—Good new rough Oregon Pine lumber, all sizes, at \$10 to \$15 per thousand.

—Oregon Pine lath, 4 ft., new, \$2.50 per thousand.

—Best grade Slashed Grain Oregon Pine, sanded finish, \$37.50 per thousand. This makes a beautiful interior finish.

—These prices will give you an idea of how our lumber department can save you money. Send in your lists and let us give you our price delivered.

Paints \$1.50 Gal.

—You can buy paints cheaper from us than any other dealer in the West. We buy in large quantities an dsell for the lowest prices.

—Standard House and Floor Paints, \$1.50 per gal.

—Standard makes of varnishes at 25% off regular prices.

—Everything in Paints, Wall Tints, Brushes, etc., at big savings to you.

Dutch Kalsomine 4½¢ per lb.

Black Graphite Roof 50¢

—per gal. 85¢

Standard Roof Paints—red, green, gray—per gal. 85¢

Shingle Stain, made from pure ground colors 50¢

—per gal. 50¢

"Standard" Roofing Paper

—A splendid quality of roofing paper that most firms would sell 20 to 40 per cent higher. Each roll complete with necessary cement, nails, etc., ready to lay.

1-ply, double-sanded, per roll of 108 square feet..... \$1.15

2-ply, double-sanded, per roll of 108 square feet..... \$1.40

3-ply, double-sanded, per roll of 108 square feet..... \$1.65

1-ply, "King" smooth, per roll of 108 square feet..... \$1.25

2-ply, "King" smooth, per roll of 108 square feet..... \$1.50

3-ply, "King" smooth, per roll of 108 square feet..... \$1.75

—Send for free sample. Remember we ship direct to you.

SHOVELS!—At Wholesale Cost—SHOVELS!

—You may go a life time before you get such an opportunity again. These shovels are in A-1 order but have been slightly smoked by means of a fire while in transit.

—Every one in perfect working condition, all styles and sizes; note the prices:

Long Handle, Round Point Shovels, per doz. \$4.85 or 50¢ each

Long Handle, Square Point Shovels, per doz. \$4.85 or 50¢ each

D Handle, Round Point Shovels, per doz. \$4.15 or 50¢ each

D Handle, Square Point Shovels, per doz. \$4.15 or 50¢ each

Long Handle Spades, per dozen..... \$3.75 or 40¢ each

D Handle Spades, per dozen..... \$3.75 or 40¢ each

Long Handle Scoops, per dozen..... \$3.75 or 40¢ each

D Handle Scoops, per dozen..... \$3.50 or 40¢ each

Dana Freezers at Half

—A big lot of Dana freezers. Send in your order today. We've sold hundreds of them at these prices and have yet to hear a single complaint.

3-quart size, regular \$2.25, now..... \$1.00

4-quart size, regular \$2.50, now..... \$1.25

\$30 Wallboard for \$19

—The highest grade wallboard on the market; made of 3 layers of moisture-proof fibre, with asphaltum between each layer; or cream white fiber board.

—Cheaper and neater than plaster or lumber, and anyone can install it in one-quarter of the time. Per 1000 square feet..... \$19.00

This Special Steel Enameled Bath Tub \$8

—One of the greatest bargains we ever offered! Made of best galvanized 24 gauge steel.

Outside is finished in a rich sky blue enamel with bronze trimmings and hardwood edge. Priced only \$8.

—Other larger sizes at \$8.50, \$9 and \$10.

Low Down Enamel Steel \$11.50

Toilet Combination..... \$11.50

Complete to floor—wonderful value.

Low Down Vitreous China \$15.50

Closet Combination..... \$15.50

Special value—worth \$22.50.

Big value in High Tank \$10.00

Toilet Combinations..... \$10.00

Complete to floor—a bargain.

Special Bankrupt Stock of Kitchen Sinks.

All sizes—up from..... \$1.00

Best Quality Porcelain Lavatories, every one guaranteed—\$10 down to..... \$3.75

Thursday, August 19, 1915**OUR ADVERTISERS RELIABLE**

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

SILOS

We believe dairymen will find valuable hints in Mr. Guilford's article on dairy and live stock page of this issue. Whether hay is high or hay is low we believe the silo affords one of the cheapest and most satisfactory methods of storing feeds. Next week's article by Mr. Guilford will continue the same discussion.

AT BERKELEY

The agricultural college of our state university has called all of its instructors and members of experiment station staffs and farm advisers to meet in Berkeley this week. This will bring all those interested in agricultural education and investigation together. Such conferences must result in good to the agriculture of the state.

POULTRY FOR PROFIT

It has been some time since we referred to one of the best books yet printed on the Pacific Coast. It is "Poultry for Profit," a practical manual for beginners, farmers and side line poultrymen. It is by Mrs. Koethen who writes nearly every week for Cultivator readers. Mrs. Koethen's book gives hints secured from actual experience and not from theory. The poultry business now calls for a little shrewder management than ever before and this book is one of the most helpful to that end.

AMERICAN POMOLOGICAL

A little more than a week later the American Pomological Society will convene in Berkeley. As we go to press the delegates are entering the state by the way of Southern California. The first of next week will be spent at the Panama-California Expo-

sition at San Diego. Three days will be given to visiting the orchards in the vicinity of Riverside and Los Angeles. After the sessions in Berkeley some days will be devoted to the horticultural exhibits made at the Panama-Pacific Exposition at San Francisco.

RAISINS TO EUROPE

The raisin growers are pleased at the receipts of a 3,000 ton order for raisins to be shipped at once to England. This is by far the largest order ever received by California shippers of raisins for export. The manager of the Associated Company says there is indication that other orders will soon be received. This is secured largely because of the shutting off of Mediterranean ports by war activities, but it is possible this giving of a chance to California raisins to show their quality may lead to more general acquaintance.

VALUABLE REPORT

The proceedings of the 45th State Fruit Growers' Convention, or the convention which was held in Los Angeles in November, 1914, is a most valuable book of nearly 400 pages. It is being mailed by State Commissioner Cook to all who registered at the convention, also to anyone who writes requesting it. Those of the Cultivator friends who live near Los Angeles may secure a copy by applying at this office. It contains all of the addresses made at that convention and a very complete report of proceedings which were taken during the convention by shorthand reporters. In addition to the text there are a large number of halftone illustrations.

STATE COMMISSIONER

In our report of the state convention of county horticultural commissioners held at Palo Alto we referred to the fact that certain San Francisco papers had circulated a report that the county commissioners in executive session passed resolutions favoring a successor to Dr. Cook as state horticultural commissioner, and that the commissioners stated there was absolutely no discussion on that subject. Since then the president of the state association, Wm. Wood, has written those who were in attendance at Palo Alto, asking them for a statement as to such matters being discussed in any sessions held by the horticultural commissioners. Twenty-five have already responded to this request and have stated positively that no such action was taken.

SHORT COURSES

Another week we will have more extended announcement of the short courses which will be held this fall at the university farm at Davis, but we may be permitted here to call attention to the fact that there is scarcely any activity agriculturally but may be helped by these courses. All kinds of horticultural subjects are treated. The poultryman, the live stock man, especially the dairyman, may find most valuable instruction in these few weeks of lectures. There is many a farmer in California who is finding that his calling demands more and more as the years go by, and more scientific methods must be employed to meet competition. To give this information the short courses have been instituted, and every farmer in the state should at least write to Dean Thomas F. Hunt for information regarding them.

BEAUTIFYING THE STATE

It has been predicted that one result of the holding of the two great expositions in this state will be the beautification of our cities and rural communities. It seems that it would be impossible for the people of this state to visit—as they generally will—these expositions and not go home with a desire to add more beauty to their homes. It has been said that the great buildings and the immense expenditures required in their construction are so beyond the reach of most of us that they cannot have any great influence on our homes, yet the desire for more beauty may be gratified with little money. If one geranium is planted or if one tree is allowed to stand to add to the beauty of the landscape because of the influence of these expositions our state will be the richer.

An Eastern expert in referring to the value of the expositions says that they will be far-reaching in demonstration of the "actual commercial value of artistic assets." He declares the Expositions really city-planning expositions of the first order and urges application of the great principles displayed there in the development of every city and town in California. He predicts that they "will start an avalanche of improvements along artistic lines, which will be given increasing momentum by the development of long periods of prosperity."

PLANT BREEDER

The Iowa state college of agriculture has just bestowed special certificates for eminent services to agriculture upon Ex-Governor Hoard for his work in dairying and upon Hon. Chas. G. Patten, an Iowa plant breeder. Mr. Patten's work has perhaps made him as well known in Iowa and the Middle West as is ex-governor Hoard, for he is the producer of several varieties of plants which have done exceptionally well in that section, and it is fitting that honor be given to him because of his work and in such a way that the rest of us may know of it. The work of breeding and improving our plants has been engaged in by plant breeders the country over. At one time it was asserted that one who had power over these plants to produce a better and a bigger and a more profitable fruit was nothing less than a wizard. However, we are arriving at the stage of recognizing that it is merely applying the laws of nature in such a way as to give to the human race the better product. It does require close application and wonderful patience, and men of Mr. Patten's type who have spent a lifetime in producing better types should be honored.

Referring to Mr. Patten's work the Iowa university says: "In advance of the experiment stations of the country, on his farm near Charles City, he developed both by selection and by cross breeding new varieties of apples particularly adapted to the upper Mississippi valley. A practical plant breeder, without outside aid or funds and with only his own labor on 20 acres of land on his farm, Charles G. Patten led in horticultural study and experiment. He has contributed largely to horticultural literature, and his best apple, Patten Greening, is grown widely throughout the north Mississippi states."

A farmers' club in Wisconsin has adopted the motto "Get acquainted with your neighbor. You may like him." Not so worse for California farmers' club members.

Agricultural Notes

The Irish wheat crop covers 87,116 acres this year, against 36,913 acres last season.

A Connecticut corporation is building a large cold storage warehouse to store eggs in Shanghai, China.

Portugal will have to import 200,000 tons of wheat to supply the deficiency in her home harvest. The country usually produces a surplus.

The Austrian-Hungarian minister of agriculture and industry has issued a decree that the import of molasses into Austria will be free of duties.

The Argentine government is conducting an active campaign to extend rice farming. Approximately 12,000 acres in Argentina are now used for that purpose.

American quail, or "bob whites," have appeared in British Columbia this season for the first time. Previous efforts to introduce them into the Canadian country have been unsuccessful.

One thousand cans of tomatoes can be put up at home at a cost of \$26.05, according to a letter sent out by the Arkansas bureau of agriculture, pointing to cotton growers the way out of hard times.

The department of agriculture announces that Stuben County, New York, has been placed under quarantine on account of the discovery of foot and mouth disease in a herd of cattle near Hornell in that county.

The National Dairy Show will not be held this year. The management pledges itself to a greater show October 26 to November 4. The decision to postpone the show is due to caution lest the foot and mouth disease be not entirely stamped out.

No small portion of the hogs in Eastern packing houses are raised by the children of the small orchardists and ranchers in various portions of the country. The pig clubs and other inducements to the children to handle a little business of their own are resulting in much good to small farmers.

"De Java Bode" says that the war has brought an entire change in the sales markets of the Java sugar. Before the war most of the Java sugar was sold in the Orient (Japan, China and Australia). Since the outbreak of the European war, England has become the larger buyer of the Java sugar. Of the 1914 harvest she has taken 37 per cent.

All indications at present are that the 1915 peach crop of the United States will be the largest in the history of the country. Many of the larger producing areas will have substantially increased yields, in some of which there was a dearth last year, while in the entire country there is only one district—that of Colorado—in which the crop is noticeably shorter than in 1914.

Five thousand Ontario, Canada, fruit growers this season are cooperating with retail merchants. These fruit growers got together and subscribed jointly to a campaign of advertising, the object of which was simply to urge consumers to see their fruit dealer and have him make provision for them by securing fruit in advance. This plan has worked so successfully that consumers all over Canada are today able to secure plentiful supplies of all fruits, and the retailer has increased his business, his fruit in many instances being sold in advance of its arrival at his store.

Agricultural News Notes

of the Pacific Coast

Northern California

Hop growers are sending out notice that no more pickers can be used in the yards at Wheatland.

The Mendocino Hop Growers' Association has fixed the price for hop picking at \$1.00 per 100 pounds.

Farmers' short courses at the university farm at Davis will open October 4, continuing till November 12.

The next meeting of the Humboldt County Dairymen's Association will be held at Ferndale on Tuesday, September 7.

A petition will be presented to the Lake County board of supervisors for the formation of a drainage district in Scott's Valley.

A dairy barn 208 feet long, 60 feet wide and 26 feet at the peak has just been completed for H. R. Timm of Dixon, Solano County.

County Horticultural Commissioner Harney of Yuba County estimates that the rice crop of that county this year will have a gross value of \$240,000.

Anderson, Shasta County, has disposed of the last of its berry crop, and packing houses are now working to capacity on peaches, pears and prunes.

A variety of Japanese bamboo being tested out at the government plant introduction gardens at Chico has an official record of 18 inches' growth in 24 hours.

County supervisors of Butte County will not force the clean-up of weeds at this time, but the weed survey will be continued so that all will be ready for a campaign in the spring.

The California State Beekeepers, in convention at Civic Auditorium, San Francisco, last week, passed a resolution requesting the state university to establish a chair of apiculture.

The California Growers' Association is planning to establish a cannery to care for the fruit of Sutter and Yuba Counties. This cooperative association now has canning plants at Tulare, Kingsburg and Woodlake.

State Veterinarian Keane has issued a call to Mendocino County sheep growers to meet him at Cloverdale to discuss drastic action to prevent spread of sheep scabies which is becoming serious in that county.

Work of examining lands over the county for yellow star thistle is being actively pushed by Horticultural Commissioner Mills of Butte County. Twenty field men are at work, each in an especially assigned district.

The chamber of commerce of Oroville, Butte County, has received so many letters of commendation and appreciation of the flower distribution on overland trains at Oroville that it has decided to continue this custom.

A storm drainage campaign is being developed by the Glenn County farm bureau. In this undertaking the various needs in each farm center are being shown on base maps, the idea being that the farmers themselves, in cooperation with irrigation companies and the county board of supervisors, shall make a concerted effort to relieve surface water floods which menace portions of the farming area during the early spring months each year.

Central California

There will be a Holstein Friesian breeders' sale at Hanford, October 14.

Farmers' short courses begin at the university farm at Davis October 4, ending November 12.

There has been a decided decline in prices of Turlock cantaloupes the last week owing to the large amount being shipped.

George F. Miles, an expert of the United States department of agriculture, is in Visalia investigating the beet sugar industry.

The heavy crop of sugar beets in the district tributary to the Visalia factory promises to keep it running until well into October.

Charges have been made that some Fresno grape shippers sent out unripe Malagas just before the standardization law went into effect.

The California Associated Raisin Company, during the last week of August, sold nearly 3000 tons of raisins for export to Europe. Most of them went to England.

The International Irrigation Congress will hold sessions in Stockton, September 13-14; Fresno, September 15-16; Sacramento, September 17-18, and San Francisco, September 20.

Accurate information as to water development possibilities of the Stanislaus watershed is to be secured by the irrigation districts working in cooperation with the federal government.

County Horticultural Commissioner Collins of Tulare County has asked the board of supervisors for an assistant inspector as it is impossible for him to do the work properly alone.

Vernon Campbell, manager of the California Growers' Association, on last Saturday addressed deciduous fruit farmers at Hemet, Riverside County, as to the advisability of establishing a cannery.

The management of the Fresno District Fair is making premium lists. The fair is to be held September 28 to October 2. Those interested may write Secretary C. G. Eberhart, Chamber of Commerce Building, Fresno.

Inspectors who are enforcing the new fruit standardization law in Fresno say they are meeting general cooperation among the packers. At present the inspectors are making daily trips to the different packing houses.

The Tulare Fruit Growers' Association has organized with the following directors: H. L. Eggleston, J. W. Railbey, G. C. Dorman, F. P. Storm, Andrew Benson, A. R. Goodman, G. W. Goodman, J. W. Dunlap, J. H. Cochran, F. H. Stiles and Vernon Campbell.

Inspectors appointed by Horticultural Commissioner Collins of Tulare County are: W. A. Bates, M. A. Harper, George W. Harper and George W. Martin of Dinuba; W. J. Cairns at North Dinuba; C. B. Earhart and R. D. Dedhirst at Sultana; W. M. Beinhorn at Cutler; A. Fraser at Smyrna; L. A. Campbell at Seville, and W. A. Magatagan at Giffen.

Southern California

Beaumont, Riverside County, now has a fruit cannery.

Paso Robles, San Luis Obispo County, expects to ship 70 tons of walnuts.

Walnut buyers are reported to be offering 12½ and 14 cents, orchard run, for walnuts.

Ventura County's second annual fair will be held at Seaside Park, Ventura County, August 26-28.

Lemons have advanced about 25 cents a box and growers are feeling correspondingly relieved.

W. E. Packard, in charge of the experiment station at Meloland, is holding demonstrations of a new hopper-dozer.

The Anaheim Citrus Association has closed down for about a month, having shipped to date 360 carloads of oranges.

The horticultural commission of Riverside County is notifying owners of land infested with Russian thistle to remove it.

The California Vegetable Union is about to begin construction of a large packing house at Garden Grove in Orange County.

The La Habra Citrus Association has already shipped 140 cars of Valencias. It is now holding off shipments for the September market.

The first fine imposed this season for leaving a camp fire burning in the woods was imposed against a Pasadena man. The fine was \$50.

David Darling, a rancher of the Palo Verde Valley, has harvested 120 ninety-pound sacks of Tepary beans from a little less than seven acres.

Manager Renfro of the National Orange Show to be held at San Bernardino February 17-24 proposes a southland garden effect as a general decorative scheme, vine clad pergolas to be used extensively.

The packing house of the Santa Ana Valley Walnut Growers' Association at Santa Ana is being thoroughly overhauled in preparation for the new crop. The capacity of the plant is increased from 30 to 40 tons daily.

Riverside will hold its district fair for five days, October 5-9. The Hemet fair will be held October 12-16. Orange County has not yet decided whether her fair will be held September 28 to October 2, or October 19 to 23.

Hemet and San Jacinto Valley fruit growers met at Hemet Saturday, August 14, to listen to an address by Manager Vernon Campbell of the California Growers' Association on cooperating in processing and marketing of fruit. There is a movement of growers of the valley to establish a cooperative cannery.

A company subsidiary to the California Fruit Growers' Exchange has selected Corona, in Riverside County, as the site of a factory for the manufacture of citrate of lime, lemon oil, lemon emulsion and other by-products. The new company is capitalized at \$100,000 and its shareholders are all lemon growers.

The Coast

A sugar factory is now assured for Salt Lake County, Utah.

The Northwest Live Stock Show will be held at Lewiston, Idaho, November 29-December 4.

A severe hail storm in Douglas County, Washington, destroyed wheat in a strip two by 12 miles.

The University of Idaho has compiled a directory of breeders of pure bred live stock within the state.

The sugar factory at Logan, Utah, is harvesting its seed crop, which it is estimated will amount to 21 carloads.

The fifth annual Columbia River Grape Carnival will be held at Kennewick, Washington, September 12, 13, 14.

The Alfalfa Seed Growers' Association of Yuma Valley, Arizona, will sell from three to four carloads of seed this year.

Eastern Oregon streams are reported at their lowest in 20 years, giving rise to many disputes between water users.

Kennewick, Washington, farmers are taking advantage of the new Celilo Canal to ship their hogs down the river to Portland.

The state fair association of Utah is discussing the advisability of abolishing admission fees and having an absolutely free state fair.

A carload of fancy sheep will be sent by the Gallatin Valley Sheep Breeders' Association of Montana to a half dozen of the county fairs.

Agriculturists of the University of Utah are conducting a farm survey in the irrigated sections of Salt Lake, Weber and Box Elder Counties.

The experiment station staff of Utah state college is preparing an exhibit for the Dry Farming Congress, which will be held at Denver, September 27 to October 9.

County poultry associations of Montana have decided to join in sending a carload of prize-winning poultry to enter the show at the Panama-Pacific exposition.

The North Pacific Fruit Distributors reports several inquiries for large carload lots of apples and states that the market prospect generally is vastly ahead of last season's.

Sheep men expect that feeding lambs will bring record prices this fall. Many have already been contracted at prices ranging from \$5.75 to \$6.50 per hundred weight.

The American Shorthorn Breeders' Association is offering a number of prizes for cattle of that breed at the Cascade International Stock Show to be held at Spokane, September 13-18.

Richland Valley, Washington, will hold its festival September 9 and 10. Exhibits from this festival will be displayed also at the Columbia River Valley Grape Carnival at Kennewick, September 13-15.

A big order has been received by Wenatchee shippers for 300,000 boxes of standard apples. Most of this shipment is intended for the Australian and South Africa markets and includes 30 varieties.

Order Now

Your Ideal Green Feed Silo

You will never make the profit you ought to from your cows until you feed them silage.

Corn makes the best silage, but any good forage crop will make good silage providing you have a good air and water-tight silo.

If you have any growing crop suitable for silage, now is the time to order your Ideal Green Feed Silo and get it up in plenty of time to fill.

SILOS IN CALIFORNIA

Written for California Cultivator
By W. S. Guilford

SILOS are not new in California, and in the eastern states and in parts of Europe the use of silage is a practice many years old.

The history of silo building has been that the building of a few isolated silos does not always lead immediately to a general silo building movement, but gradually the great value of silage as feed becomes more and more apparent to the neighbors, and all at once silos spring up by the dozen.

In one district in northern Illinois

had been enough to last until silage time again.

At the J. L. Gibson ranch at Williams silage was made from sorghum last year. It yielded at the rate of about 25 tons per acre. This year Indian corn is being grown to fill the two DeLaval silos.

At the Morris ranch at Woodland they have silos made of two by four studding and half inch resaw redwood lumber. There are also two of these at the Butte City Berkshire ranch at Butte City in Glenn County.

For these resaw silos studding are set upright about 14 inches apart, then redwood boards six or eight inches wide and one half inch in thickness

TWO DE LAVAL SILOS, J. L. GIBSON CO. RANCH, WILLIAMS

there were no silos ten years ago. Now they are on almost every farm, and the building of one on a farm frequently leads to the building of two or more.

There is this same situation in some parts of California now; one or two silos have been built, and many, many more are as sure to come as taxes.

All kinds of silos are satisfactory if they are properly built and cared for, but the stave silo is largely responsible for the great popularity of the silo in America today because it has proven satisfactory under a wide range of conditions at a very modest cost.

There is a great advantage in community building of silos, for this makes community ownership of silo filling machinery and changing work at filling time possible.

The acreage in corn in California is increasing very rapidly, particularly in the Sacramento Valley. All kinds of corn are being grown and all sorts have been found to be satisfactory for making silage.

Last season Alva Slocum at Willows put milo, Egyptian corn, feterita and some other crops in a DeLaval Green Mountain silo, and I have never seen richer or better feed come out of a silo. He planted these varieties of feed on land that had already raised a big crop of alfalfa hay during the early summer, the ground being checked and levelled for irrigation and an abundance of irrigation water available from the Sacramento Valley Irrigation Company canals.

He fed the last of the silage out some time in June, and both Mr. Slocum and the cattle wish that there

are bent around on the inside to make a continuous lining. This is covered with tar or roofing paper to make an air tight layer, and a second layer of half inch redwood is placed inside that. At the Butte City ranch there is an additional layer of half inch pine put on the outside to make a protection for the inner layers of redwood.

As will be noted in the illustrations, one of these is covered with resaw pine eight inches in width and put on horizontally—the other was covered with resaw pine twelve inches wide put on at an angle. There was a small saving in the labor cost in putting on the latter.

Silage is used more for dairy cattle than any other class of stock, although thousands of tons are now being fed to fattening cattle and sheep all over the United States and Canada. It is also fed to hogs for succulence and roughage where no cheaper feeds are available. There are several farms in California where it is being used in this way.

The silo will be found particularly valuable on the medium and small sized intensely cultivated, irrigated farms that are being established all over the state. On these farms it is necessary to make the greatest possible return per acre and feed of all kinds must be made into as many dollars' worth of high class products as possible. Animal manures will be used on the corn land to make the largest possible per acre yield of silage material, and the silo will keep it in the most palatable form for milk and meat production.

Indian corn is cut for silage until after the kernels in the ears have

We send any dealer one dozen, express prepaid, in display box at \$4.00; retail for \$6.00, to be paid for when sold and consumer satisfied. Reference Farmers State Bank, this city.

Williamson Mfg. Co. Box B Sheffield, Ill.

passed through the dough stage. If there is a large field and the corn is drying rapidly, the cutting may be started shortly before the corn reaches this stage, and if it gets too ripe water can be run into the silo and a good product will result. The stream from a three quarter inch hose is frequently run into the cutter during filling time when the fodder is somewhat dry.

Corn is cut either by hand with a corn knife or with a corn binder and hauled in with low wheeled wagons.

It is very important that the corn be thoroughly tramped as it goes into the silo so as to fill up any air spaces—

DETERMINING FEEDING VALUES
Written for California Cultivator
By F. B. Morrison

Continuing the discussion of feed values determination, Mr. F. B. Morrison, co-author with Prof. W. A. Henry of "Feeds and Feeding," comments as follows:

YOUR letter has been referred to me by Professor Henry, but I find that I mislaid it and it thus did not receive immediate attention. For the past two years I have been spending all my spare time working on a complete revision of 'Feeds and Feeding,' as co-author with Professor

stations and by the United States Department of Agriculture. We have undertaken this stupendous task at our own expense because we felt that the data contained in Farmer's Bulletin 22, and upon which the appendix tables in the present 'Feeds and Feeding' are chiefly based, were far too extensive, as this table was originally gotten out

originally published in Farmer's Bulletin 22.
"You may be interested in the figures for dent corn, wheat, bran, and dried beet pulp which will appear in the new edition of 'Feeds and Feeding,' and I am adding the number of analyses upon which these figures are based.

	Dry matter	Crude matter	Carbo-hydrates	Fat	Total digestible nutrients
Dent corn	89.5	7.5	67.8	4.6	85.6
Wheat bran	89.9	12.5	41.6	3.0	60.8
Beet pulp, dried.....	91.8	4.6	65.2	0.8	71.6

in 1895. The United States Department of Agriculture has two or three times begun the task of bringing this compilation down to date but has given it up on account of the time and expense involved. We are now just completing the work, which has involved going through all the bulletins of the state experiment stations and the United States Department of Agriculture and represents the work of one person working full time for practically three years. In these compilations we have not only recorded the composition of the feeds but have also made a complete compilation of the digestion coefficients, such as are given in Table II., and of the fertilizing constituents, such as are given in Table III.

"Your correspondent asks which is the most correct standard, the present edition of 'Feeds and Feeding' or Farmer's Bulletin No. 22. I would state that in most cases the present 'Feeds and Feeding' figures are based chiefly upon Farmer's Bulletin 22, but were corrected more or less in view of more recent data. They are, therefore, more accurate than the figures

"The average for dent corn is now based upon 440 analyses instead of 86; for wheat bran 7742 analyses instead of 88; for dried beet pulp upon 48 analyses instead of 7 as in the present edition of 'Feeds and Feeding.' You will thus see that the new figures are immeasurably more accurate than the old ones. In the column 'Total digestible nutrients' we give the sum of the protein, the carbohydrates and the fat X 2.25. You will note that dent corn is considerably higher in total digestible nutrients than dried beet pulp, and dried beet pulp is considerably higher than wheat bran.

"Your correspondent asks which is the best guide in determining the food value of a concentrate, the percentage of digestible nutrients or the experiments carried out at the different stations. I would state that where the feeding trials have been conducted with a sufficient number of animals and repeated so that the results are reliable, the results of feeding trials are far more important. It is for this reason that we summarize the results secured at the various stations in Part III. of 'Feeds and Feeding.' So

TWO RESAW SILOS AT BUTTE CITY RANCH

for air makes mouldy silage.

Corn is cut into pieces one half inch to one inch long.

A great deal of alfalfa is made into silage in California, particularly when it is very weedy.

The time is not far off when silos will be as familiar sights in our fertile valleys as they are in the Mississippi Valley now.

Henry, and we are just now getting the last of the manuscript in shape for the printer.

"For the new edition of 'Feeds and Feeding' we have made a complete compilation of all the analyses of American feeding stuffs which have been made at the various experiment

TWO GREAT SALES

Combination Sale!

A. W. Morris & Sons
WOODLAND, CALIFORNIA

McAlister & Son
CHINO, CALIFORNIA

High Class, Registered
175 Holstein-Friesian Cattle **175**

TUBERCULIN TESTED

State Fair Grounds, Sacramento, Cal.

OCTOBER 6 - 7, 1915

Far and away the Greatest Sale ever held in the West and in respect to Individuality and Yearly Records the Greatest in the United States!

Great Record Cows

About 50 large record cows in sale with records as high as 31 lbs., including a 28-lb., 3-year-old, a 28-lb. daughter of Johanna McKinley Segis, a 25-lb. daughter of Aaggie Cornucopia Johanna Lad, and many with great yearly records.

Daughters of Great Record Cows

About 100 heifers, nearly all from great record cows with records as high as 33 lbs. butter in 7 days and 1000 lbs. butter in 1 year.

Daughters of Great Bulls

More daughters of great sires than any sale in the West, including 10 of the best daughters of Morris' senior herd sire, King Segis Pontiac Emperor—10 daughters of Lorena Korndyke, the great show bull—20 daughters of King Pontiac Topsy, one of the best sons of King of the Pontiacs—5 daughters of DeKol Hengerveld Burke, sire of two, 30-lb. daughters—daughters of Johanna McKinley Segis, the \$25,000 sire, and other great sires.

Bred to the Greatest Bulls

The females of breeding age are bred to the greatest bulls in the West, including the son of Tillie Alcartra, a son of Riverside Sadie DeKol Burke, a son of Aralla De Kol, a son of King of the Pontiacs. Consider that many cows and heifers are in calf to sons of cows that hold every world's milk record from 7 days to 3 years.

Greatest Bulls Ever Offered

At public sale in the United States will be sold—including King Segis Pontiac Emperor, senior herd sire of A. W. Morris & Sons—Lorena Korndyke, the great show bull—2 sons of cows with records of over 1000 lbs. butter in 1 year, including DeKol of Valley Mead 2d, who holds breed record for production as a 3- and 4-year-old—and a number of other bulls from high yearly record dams, sired by sons of world's champions. Also a number of lesser merit out of large record cows.

King Segis Pontiac Emperor in respect to both breeding and individuality is unquestionably the greatest bull ever offered at public sale anywhere.

Terms
\$500 and under, cash; over \$500, one-third cash; balance in 3, 6 and 9 months with bankable note and 8% interest; 3% discount allowed for cash on time sums. Buyers from a distance must bring satisfactory bank references.

California Holstein

Breeders' Second

Consignment Sale

REGISTERED
100 HOLSTEINS **100**

TUBERCULIN TESTED

Hanford, California

October 14 - 15, 1915

CONSIGNORS

R. F. GUERIN, Visalia
ALEX WHALEY, Tulare
W. J. HIGDON, Tulare
and C. C. TESTER, Gilroy, who is disposing of his entire herd of 65 head.
HEWITT & HEWITT, Hardwick
McALISTER & SON, Chino
E. O. FAWCETT, El Monte

THE ABOVE CONSIGNORS ARE BREEDERS OF STATE WIDE REPUTATION AND YOU ARE ASSURED OF RECEIVING FROM THEM GOOD CATTLE AND GOOD TREATMENT

The splendid list of offerings this year includes about 25 Advanced Registry cows with records as high as 29.90 lbs. butter in 7 days as a 4-year-old (highest record 4-year-old ever sold in public auction in the West), including a 24-lb. 3-year-old.

About 30 daughters of Advanced Registry cows with records as high as 30 lbs. butter, including 2 daughters of the 29-lb., 4-year-old daughter of the 24-lb. 3-year-old; daughters of a 22-lb. cow.

A Noteworthy Feature

Will be 15 daughters of Dutchland Sir Pontiac Rag Apple, son of Colantha Johanna Lad and Aaggie Cornucopia Pauline 3d., out of cows with records as high as 30 lbs. This is the greatest bred son of the famous son of the former world's milk and butter champion.

Also daughters and grand-daughters of such great sires as King of the Pontiacs, 164 A.R.O. daughters, Homestead Girl DeKol Sarcastic Lad, 104 A.R.O. daughters, Juliana King of Riverside, whose daughters average 800 lbs. butter for yearly production—Johanna Rue Sarcastic Lad, half brother to the new world's champion, Lorena Korndyke, Pontiac Hengerveld Parthenia, sire of world's champion sr. 4-year-old, King Segis Pontiac Emperor.

What Will Their Calves Be Worth?

Sired by a son of Till Alcartra, world's champion milk cow—a son of a 36-lb. cow—a son of Juliana DeKol, former world's record 2-year-old—brothers to the world's champion sr. 3 and sr. 4-year-old—son of a cow with a record of 870 lbs. butter in 1 year, and other bulls of equal merit. Answer—They will be worth all their dams bring.

About 20 Splendid Males

Including King Segis Pontiac Emperor 3d—son of K. S. P. Emperor, out of a cow with a record of 870 lbs. butter in one year—Sir Holland Gamp, a great show bull—Sir Riverside Tommy out of a cow with a record of 772 lbs. butter in one year, and a grandson of King of the Pontiacs out of a 28-lb. daughter of Johanna McKinley Segis.

Catalogs ready about September 18—Write for one.

important do we believe these trials to be that in working on the forthcoming 'Feeds and Feeding' we have not only gone over all the published data from the various stations, but have secured the results of unpublished trials from a majority of the stations in the United States.

"You will understand that when but a single trial has been conducted in which two different feeds are compared, even if a fair number of animals were included in each lot, we cannot be too sure that the results would not be materially different if the trial was repeated, on account of the experimental error involved. For this reason, wherever possible we are averaging together the results of all the trials which bear on a given point, for thus only can the most reliable results be secured.

"In regard to the relative value of beet pulp and wheat bran I would state that these feeds should not in a way be compared, for dried beet pulp is a carbohydrate-rich feed, low in protein, while wheat bran is used as a protein concentrate. You will see that they really fulfill different functions in the ration. When fed with other feeds low in protein, wheat bran should have a far greater value than dried beet pulp. On the other hand if fed with alfalfa hay, the value of dried beet pulp would undoubtedly be higher than that of wheat bran. In the new edition we will give the results of a trial by Lindsey at the Massachusetts station (Massachusetts Report 1913, Part I, pp. 129-140), in which he found 4.3 pounds of dried beet pulp equal to the same weight of corn meal when fed to dairy cows with a basal ration of 2.0 pounds wheat bran, 0.7 pounds cottonseed meal and 17 pounds mixed hay. This you will see agrees with the results secured in fattening sheep, as given on page 466 of the present 'Feeds and Feeding', where dried beet pulp was equal to the same amount of corn. From these trials I would conclude that when fed as part of the concentrate mixture dried beet pulp could replace corn pound for pound.

"As you will find on page 120, Armsby rates dried beet pulp at a net energy value of 60.10 therms per 100 pounds, while he gives corn the value of 88.84 therms. These figures are in most cases only computations and not determined by direct experiment. However, from the composition and character of beet pulp I would conclude that if fed as a sole concentrate allowance to dairy cows or fattening animals, it would not quite replace corn pound for pound.

"I have found no data concerning the relative value of steam-dried and fire-dried beet pulp.

"You will probably be interested in learning that the new edition of 'Feeds and Feeding' will be out about the first of October."

MILK FEVER

Came near losing my cow when fresh on account of milk fever. Is it safe to breed her again?—Subscriber, Alhambra.

The more valuable the cow the more liable to milk fever. We would surely breed this cow again and would take care that there is no recurrence of the disease. It is a disease which is far easier to prevent than to cure. The first treatment is to dilute the blood and overcome one cause of the disease, which is constipation. Laxative foods such as oilcake meal and even doses of epsom salts are recommended one to three days preceding the calving period. There should be exercise in the open air and the cow should be protected from extreme heat. The disease never occurs with young stock with first calf. The older and more productive the cow the greater liability to this trouble. In other words, the cow has ceased her growing and all the powers are given to producing a large flow of milk.

"Among the most efficient preventives may be named a spare diet (amounting to actual starvation in very plethoric, heavy-milking cows) for a week before calving and at least four days after. A free access to salt and water is most important as the salt induces drinking and the water serves to dilute the rich and dense blood. Iced water, however, is undesirable, as a chill may bring on fever. A dose of Epsom salts (1 to 2 pounds) should be given 12 to 24 hours before calving is due, so that it may operate at or just before that time. In case calving has occurred unexpectedly in the heavy milker, lose no time in giving the purgative thereafter. A most important precaution in the fleshy, plethoric cow, or in one that has been attacked at a previous calving, is to avoid drawing any milk from the bag for 12 to 24 hours after calving. Breeders on the Island of Jersey have found that this alone has almost abolished the mortality from milk fever. If Epsom salts is not at hand use salt-peter (one ounce) for several days. Daily exercise is also of importance, and, excepting in midsummer when the heat of the sun may be injurious, the value of the open air is unquestionable. Even in summer an open shed or shady grove is incomparably better than a close, stuffy stall. A rich pasture (clover especially) in late May, June or July, when at its best, is to be carefully avoided. Better keep the cow indoors on dry straw with plenty of salt and water than to have access to such pastures."

The above from Diseases of Cattle, United States Department of Agriculture, does not refer to the air pump remedy which is often most successful. This consists of a common bicycle pump or a pump which is provided for the purpose applied to the teats in such a way that the udder is greatly distended.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Paralysis

What is the matter with my hogs? They seem to be perfectly well but in a few hours will lose the use of their hind quarters but retain their appetite. They are fed sweet skim milk and run on alfalfa pasture. They are given fresh water once a day. It seems to affect young hogs five or six months old most. Would like to know remedy.—Subscriber, Tulare.

Cases of paralysis of the hind quarters of hogs are not common among those that have fields to run in. Until we can get more information on the subject be sure that they have plenty of fresh water and add to the feed of

each hog a tablespoon once a day of the following: Salicylate of soda two ounces and tincture of juniper berries one pint. Mix and give as directed above.

Difficult Breathing

When our cow eats from a manger, even a low one, she breathes so loudly one can hear her many yards away. About half an hour after leaving the manger she begins breathing all right. When she eats from the ground she breathes all right but that is a wasteful way to feed hay. She has a good appetite, is in good health and gives a good supply of milk. What shall I do for her? Is the milk unwholesome to use?—Subscriber, Lodi.

It must be that she leans her neck on the manger as that seems to be about the only way that she could strangle herself under those conditions. Cut out the manger in the middle so she can not rest her neck against it. Some animals form peculiar habits and we have to use our wits to overcome the trouble for them.

Expense of Saddle Horse

Will you kindly tell me how much it would cost to keep a saddle horse in the city, how often he should be shod, etc. I would only ride him evenings and Sundays.—Subscriber, San Francisco.

The board and care of a saddle horse would be from \$20 to \$25 per month. He should be shod as often as once a month, but that would depend on the horse's gait and the amount of work he gets. Some saddle horses have a shuffling gait and wear out their shoes very fast and need to be shod much oftener. So the feed, care, shoeing and other incidentals that always occur will amount to about a dollar a day.

Inflamed Quarter (Mammitis)

We have a fine Jersey cow that has an affection of one of her teats. About a week ago we noticed her lying down and apparently in much pain. We called a veterinarian and he confessed he did not know the cause. He used an instrument and blew air into the udder. Now one of the teats is hard and what appears to be a hard cord runs through the center of the teat and up into the udder. The milk in this teat is discolored, thick and extremely hard to draw. What treatment shall we give her?—Subscriber, Bairdstown.

Rub the quarter for 10 or 15 minutes at each milking time and be sure to milk out all you can. Also give her a handful of Epsom salts in the feed once a day for two or three weeks.

Chronic Indigestion

I have a horse 11 years old that has chronic scours and has spells of rolling on the ground. He will hold his upper lip up during these spells. Always keeps his head turned to his side when lying down. Can you suggest a remedy?—Subscriber, Templeton.

Your horse has chronic indigestion which causes the scours and the colicky pains at times. It may be partly due to bad teeth and overfeeding. First have his teeth fixed by one who understands that work. Then feed sparingly and very regularly. Clear out the bowels of what is irritating them now by giving a physic of aloin three drams, turpentine two ounces and raw linseed oil one pint. Mix and give at one dose. Then have the following powders prepared by your druggist and give one powder in the feed every night: Powdered gentian three ounces, powdered nux vomica two ounces, bicarbonate of soda four ounces and farina six ounces. Mix and divide into 15 powders.

Poultry for Profit

A POULTRYMAN'S PARADISE

Written for California Cultivator

By Jean A. Koethen

HERE are two different methods of correction. One is the "Thou shalt not" method, by which the person to be corrected is warned away from his sins. The other might be called the "Thou shalt" method, in which the ideal is held up and the person urged to aim at that. I remember hearing a pastor of mine say he didn't like saying "don't" to his boys all the time. He would rather keep their eyes on the things they ought to do. The poultry keeper makes mistakes enough, goodness knows, the best of us as well as the worst of us, but these are as often due to wrong ideals as to neglect or mismanagement. If his ideal is a nice bare pen so crowded with hens that one of them can hardly find herself in the crowd, he will keep his hens in bare, crowded pens no matter how much room he has. If his ideal of a poultry house is one which keeps out air and sun as well as rain and weasels, such a house he will go on using to the end of his days. It is a pleasure for once, instead of hammering away at the things that ought not to be, sickness and filth and overcrowding and the like, to be able to hold up a picture of what ought to be, and to say, "Look on this picture, and forget the other. This is the ideal. Hitch your wagon to this star."

Down in Imperial County where it is hotter than anything most of the time, and the turkeys grow like pigs, they say, on glorious, broad alfalfa patches, lives a man who is raising his chickens under absolutely ideal conditions. His name is William Brunner and his ranch is near Holtville. Mr. Brunner writes:

"I have 40 acres here, nearly all in alfalfa, fenced with woven wire five feet high. The crop is sometimes cut for hay and sometimes pastured. In winter for about three months the alfalfa makes but little growth, so we raise a crop of barley simply disked on the alfalfa. I have an artesian well continuously flowing through a two-inch pipe, at a temperature of 106 degrees Fahrenheit. The pressure, I am told, is about 14 pounds to the square inch. This well I have in mind to use for incubation and brooding of young chicks, especially since I am convinced that this is an ideal place for that. It seldom rains, very seldom a dew, a few night frosts in winter, sunny all the time. Absolutely no protection is needed except a windbreak and lots of shade after they pass the brooder stage. Corn is now \$13 per ton; barley, 80 cents per hundred pounds; wheat, \$1.50 per hundred pounds. We got 100 R. I. Reds about April 1, after three weeks moved them (97 now) from the brooder to the center of the 40 near a haystack, giving them artesian water, a little corn and wheat once a day. They practically live on green and dry alfalfa, grasshoppers, crickets, etc., and a nicer lot of chickens I never saw. Many have now nice red combs. I would be glad to know what you think of the well as a means of incubation."

I almost hesitated about printing this letter for fear there would be a gen-

eral exodus of poultrymen to Imperial Valley, but I remembered that who ever raises chickens in Imperial Valley must endure the summer heat there, for you can't take your chickens to the beach. It is an alluring picture, though—unlimited green range, bugs and grasshoppers for animal food, and cheap grain, to say nothing of water flowing all the time and no

Sacramento, California State Poultry Association, Jan. 14-18, 1916, C. A. Wilkins, P. O. Box 1117, Sacramento, secretary.

water bills coming in. I paid \$1.15 for the last 50 pounds of wheat I bought for my turkeys—I don't think of feeding it to chickens any more—and in the community where I live it costs \$5 a month in summer just to keep your lawn from dying, so this picture of abundant green feed and water to burn is like a vision of the poultryman's paradise we used to be told California was.

I am not joking at all. Abundant green range is the one thing most needful for successful and profitable poultry raising. The young chicks raise themselves. Hens lay more eggs and cheaper eggs and are less subject to disease. Breeding stock is more vigorous. Feed bills are far less. In short I can imagine nothing better for

chicks and hens alike than to run on green alfalfa in the cool of the day and scratch in the shade of a haystack while the sun is high, always provided, of course, that they have at all times sufficient shade. This is absolutely essential. We cannot all have alfalfa range and haystacks for our chicks, but we can often come nearer to it than we do.

Let me whisper something else. The man who can most nearly reach this ideal is the man who is going to be able to make poultry pay with the changed conditions we have to meet. The poultryman who buys all his feed is finding it harder and harder to compete with the farmer who raises his feed. If he is an expert and an economist and understands the principles of salesmanship, he can do it, for there is always room at the top, but the half-prepared man will never reach the top unless, like Mr. Brunner, he is in a position to raise eggs in California as cheaply as they can be raised in Kansas and transported to California. This matter of competing with the eggs raised on Kansas and Missouri farms is a mighty serious one to my mind, and I see no way of solving it except by cheaper production.

The plan of using the water from the artesian well for incubation and brooding is perfectly feasible. For brooding it would need only to be run through the brooder house in the two-inch pipe. It would not heat the house much, but if the chicks were placed in Philo brooders, 25 in a brooder, and the brooders placed just under the pipe or arranged so that the pipe would pass through them, after the plan of a Jubilee brooder, there would certainly be heat enough. Indeed, I should think artificial heat hardly necessary in that warm climate. The sun, shining through glass, should keep the houses abundantly warm during the day, and the water in the pipe could be dispensed with at night after the first week unless the nights were unusually cold.

For incubation the water might be used in either of two ways. The first is by running it through any hot-water machine. I am not sure, I don't know that any one could be sure except after trying, but I think water at 106 degrees, running through the pipe of a hot water incubator would keep the temperature just about where it ought to be. If it did not, if the temperature in the egg chamber proved to be under 103 degrees, I do not know just how you could raise it, except by using the incubator lamp, and if you used the lamp there would be no economy in using the warm water.

There is an easier way, however, and this is what I should like to see tried. Stories have been told at various times in the newspapers of persons who, having hot wells or springs, simply put their eggs in a bucket or kettle and let it stand or hang in the water till they hatched. I don't know whether these stories are true or not, but if not, why not? The only requirement for successful incubation is that the eggs shall be kept at a uniform temperature approximately 103 degrees till they hatch. There is no reason why they should not hatch in the sun if the temperature could be kept uniform, indeed, we have known only too often of incubation being commenced in hot weather when it

was neither expected or desired. The process of artificial incubation, as commonly employed, has always seemed to me unnecessarily complex. The old Egyptians just heated a thick-walled building, a sort of oven, arranged so that it would hold the heat, put their eggs into it in smaller clay ovens and let them hatch without any particular attention to ventilation or moisture, and the Chinese methods are just as simple.

Now, this is what I should like to see Mr. Brunner try: Let him take an ordinary washtub, make a hole in one side for the water to run in, and another on the opposite side to let it out. In the middle of this tub let him set the vessel containing his eggs, a pail or pan or kettle will do, provided it is water-tight on the sides and bottom and has holes at or near the top for ventilation. The eggs ought not to lie on top of one another, but I think it would be possible, if the thing proved successful with a few

For Sale—Bull tractor for plowing with 2 gang plows, used 3 months; cost \$550, our price \$350. DEMMITT CO., 120 N. Main, Los Angeles.

POULTRY

Just Out—The Cultivator Poultry Book. "Poultry for Profit," by Jean A. Koethen. Published by the Cultivator Publishing Co. Highly endorsed by experts. Over 200 pages, 50 illustrations. Contains simple methods of avoiding and overcoming difficulties. A guide to poultry success under Western conditions—it tells what to do, why to do it, and how to do it. Nicely bound in cloth. Price \$1.00 postpaid, or with Cultivator one year, \$1.75. Send orders to Cultivator Publishing Co., 115-117 North Broadway, Los Angeles, Cal.

Baby Chicks—Rhode Island Reds and White Leghorns. My guarantee safe arrival, full count, strong, vigorous, fine bred chicks, Leghorns, \$9.00 per 100. Will lay in five months. Reds, \$11.00 per 100. Will lay in six months. J. W. Lyon, Gardena, Cal.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. National Poultry Co., 607 E. Third St., Los Angeles, Cal.

We can supply you with March hatched S. C. White Leghorn cockerels from champion layers. Every hen on the ranch trapped. Our aim—full value, quality and satisfaction. \$1 and \$1.25 each. Hudson Bros., Escondido, Cal.

Baby Chicks—Electric Hatched. White Leghorns, R. I. Reds, Barred Rocks and Black Minorcas. We are booking orders for Fall delivery. THE ORLAND HATCHERY, Orland, Glenn Co., Calif.

First-Class Chix—White, Brown Leghorns, R. I. Reds, B. P. Rocks, Buff Orpingtons for September and later. Stock guaranteed. Hawkeye Hatchery, Turlock, Cal.

WANTED

Wanted—Home in country for 10-year-old orphan boy. Is well trained, industrious, bright, strong and quiet. Needs a mother's and father's interest. Will adopt to right people. H. H. Eshelman, Soldiers' Home, Cal.

Wanted to hear from owner of Farm or Fruit Ranch for sale. O. O. Mattson, Minneapolis, Minn.

Wanted—To hear direct from owner of good farm or unimproved land for sale. C. C. Buckingham, Houston, Texas.

BEEES AND HONEY

For Sale—Very fine quality extracted Sage honey, put up in sixty-lb. square cans, two cans to case. Prices, \$5.40 single can, \$10 for case. F. O. B. cars California. Satisfaction guaranteed. Sample on request. Reference, National Bank of Ventura, Ventura, Cal. Address, A. L. Duprav & Sons, Carpinteria, Calif.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckebers Press, 237 Franklin St., Los Angeles

TURKEYS

Eleven White Holland Turkey Hens and one fine tom. All mature birds and strong breeders. Excellent layers. H. McKusick, Box 733, Calexico, Cal.

DOGS

Pedigreed Alredale Pups—\$10 to \$17.50. 635 Acacia avenue. Phone 2734-W. W. R. Whitmore, Fresno, Calif.

LIVE STOCK

I have another crop of seventy-five head of BIG TYPE POLAND CHINA BOARS, born in February, sired by IOWA WONDER, who is a son of A WONDER, the GREATEST POLAND CHINA BOAR, LIVING OR DEAD. IOWA WONDER is in the 1000-LB. CLASS. One of his sons from one of my good registered sows should make YOU MONEY. I will sell the best first. On account of being overstocked will sell them at \$20 each while they last, but they will not last long at this price, so ACT QUICK if you want an EXTRA GOOD BOAR FOR LITTLE MONEY. Geo. A. Smith, Corcoran, Cal.

Billiken Herd—Pure bred, pedigreed O. I. C. swine; the big white kind. Ready for immediate shipment; weaned pigs of both sexes; pairs and trios; mated not akin. All these pigs are from big type stock, of extra heavy bone; weight, with early maturing quality. Immunized against hog cholera; crated and registered free. Write for descriptive circular and price list. C. B. Cunningham, Mills, Sacramento County, California.

Del Dayo Farm (Old Haggin Bottom Ranch) Registered Berkshires, both sexes and from weanlings to one year old. Now ready a few choice Gilts safe in pig and some very choice 10 mos. old Boars and every sale absolutely guaranteed satisfaction. Stephen S. Day, Sacramento, Cal.

The Increase From Our Herd—20 head of high grade Ayrshire milch cows, bred to full blooded bull of best quality. These cows have been bred and selected by owner for years and are absolutely free from disease. Apply Wyndham Dairy, Redding, Calif.

Grape Wild Farm Thoroughbreds—Guernsey Bulls of A. R. B. viding. BERKSHIRE HOGS. Finest Lard in the state. All ages for sale. A. B. Humphrey, proprietor. Mayhews, Sacramento Co., California.

Cholera Immune Berkshire Pigs—All ages. Registered Holstein bull. Prairie Pieter 107062, three years old—gentle and guaranteed. Selling to avoid inbreeding—\$300.00. Ricconi Bros., Mountain View.

For Sale—Registered, Berkshires. 25 choice pigs of best breeding from the best strains in America. For prices and description address H. L. Murphy, Perkins, Sacramento Co., Cal.

For Sale—At all times, Jacks and Stallions, driving and saddle horses. Price and stock guaranteed. Phillips and Kingsbury, 2318 G Street, Sacramento.

Berkshires—Pedigreed Boars ready for service. Bred sows, weanling pigs, both grade and thoroughbred, finest stock. C. H. Thompson, Novato, Cal.

Calves Raised Without Milk—Cost less than half as much as the milk raised calves. Write for free book to Coulson Co., Petaluma, Calif.

Hogs—A few thoroughbred Hampshire Boars for sale. Reasonable prices. L. P. Conway, P. O. address, Sawtelle, Calif. Sunset Phone, Santa Monica 565-M.

Berkshires Registered—Young stock from Masterpiece Strain at \$10 each. Weanling age. G. A. Casey, Box 7, King Rd., San Jose.

Poland Chinas—Young stock; either sex. Write for pedigree. Reasonable prices. Edw. A. Hall, Watsonville, Cal.

Glenview Poland China—Stock for sale. Chas. R. Hanna, R. F. D. No. 3, Riverside, Cal.

For Sale—Thoroughbred Duroc Jersey Boars and Gilts, strong and vigorous stock. Fred Hart, Exeter, Cal.

For Sale—Prize Winning Shetland ponies. Selling out. Priced worth the money. Maurice Rucker, Fair Oaks, Cal.

Berkshires—Boar pigs for sale, Butte City Ranch, Butte City, Glenn Co., California. N. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

SCHOOLS AND COLLEGES

Wanted—About seventy-five young men and women to enter The WESTERN NORMAL on August 30th, to prepare for teaching. Western Normal graduates secure and hold good positions. We assist graduates to secure good positions and promotion. We save you time and money. For information, address, WESTERN NORMAL, J. R. Humphreys, Principal, Stockton, Cal. 634 E. Main St.

Telegraphy—Stenography, bookkeeping, English branches. Positions guaranteed. Mackay Business College, Los Angeles

RABBITS

Leading Rabbitry in America—Flemish Giants a specialty. Prize winning and heavy weight stock. Scored and sold on their merits. Inquiry and inspection solicited. Catalogue on request. Empire Rabbitry, Empire, Cal.

Mt. Diablo Rabbitry—"New Zealand Reds," imported stock; no culls; prices right. State your wants. Box 117, Concord, Cal.

SEEDS AND PLANTS

Burbank Spineless Cactus—Hardest varieties, "Meirose" and "Special." Strong, matured slabs, \$8.50 per 100; \$50 per 1,000. Labranza Ranch, Athlone, Merced Co., Cal.

MUSICAL INSTRUMENTS

We repair, buy, sell and exchange musical instruments; used instruments, good as new, sold cheap. Write for bargain list. Bolander's Fiddle Hospital, 52 Second street, San Francisco.

KODAK FINISHING

Developing, 10c per roll. Printing, 2 1/2 x 3 1/2, 2 1/2 x 4, 3c; 3 1/2 x 4 1/2, 3c; 3 1/2 x 5 1/2, 4c. Denver Store, 706 S. Hill St., Los Angeles.

MISCELLANEOUS

Free for Six Months—My special offer to introduce my magazine "INVESTING FOR PROFIT." It is worth \$10 a copy to anyone who has been getting poorer while the rich, richer. It demonstrates the REAL earning power of money, and shows how anyone, no matter how poor, CAN acquire riches. INVESTING FOR PROFIT is the only progressive financial journal published. It shows how \$100 grows to \$2200. Write NOW and I'll send it six months free. H. L. Barber, 430, 28 W. Jackson Blvd., Chicago.

By having no expensive catalogue we can sell direct to you through our merchandise sales department standard lines of diamonds, watches, jewelry, tools, implements, hardware, sporting goods, etc., at money saving prices. Write us as fully as you can as to just what you want, and we will send full description, and prices that will interest you. Address Newton Poultry Farm, Dept. B., Los Gatos, Calif.

If you're not satisfied with your present job, you can make good wages selling our Teas and Coffee. Some of our Agents are making \$40.00 per week. For our special offer write C. B. Wheeler, 605 Crocker St., Los Angeles.

"Smith's Pay the Freight"—To reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

Cedar Posts—Split from Washington Red Cedar. Get our prices before buying. G. R. Kirk Co., Tacoma, Wash.

FARM LANDS FOR SALE

"GOOD NEWS FOR YOU"

SCHOOL LAND will soon be on the market under more favorable conditions than formerly. In 1853 the United States gave California School Land in ALL COUNTIES. For many years no one could buy it. But school land has been coming back all the time. YOU now have a LARGE AMOUNT to select from. Will you get YOUR share? We have spent over 25 years and many thousand dollars searching State and Government Land records. Do you want the results of our work and experience for small fees? Lists of STATE Land in any 3 Counties, \$5. County Sectional maps showing Vacant GOVERNMENT land plainly marked, \$2.50, any county. State Map showing SCHOOL Land in California, \$2.50. Your rights are worth over \$1000 if used SOON. Order TODAY, Joseph Clark, Searcher of State and Government records, Manager, California State Land Information Bureau, 1511 K St., Sacramento.

The owner of 3000 acres near Madera desires to subdivide for real settlers; the land is typical San Joaquin valley loam, free from alkali, and will grow anything; railroad crosses property and there is abundant water at shallow depth; the land is for sale at the right figure to people with proper qualifications; no cash payment down and terms to suit, provided the purchaser has sufficient money to put the land under water. Remember that there are no real estate commissions to pay to swell the price of the land; all the owner wishes is interest on his money. No real estate agents need apply. GREHNE ESTATE COMPANY, 207-208 Berkeley Bank Building, Berkeley, Cal.

Carlsbad irrigated lands—bordering ocean; on State paved highway and Santa Fe Ry, 80 miles south of Los Angeles. Government records show Carlsbad warmest in winter, coolest in summer of any spot in California. Deep soil, model water system, low rates. Lemons mature in summer when price is highest. Immense profits in fruits and berries adaptable to coast territory. Winter vegetables without competition. Minimum temperature 1914 was 41 degrees. Tomatoes, chili, peas, beans, eggplant, rhubarb, etc., bring \$150 to \$400 per acre. Easy purchase terms. Liberal leases. SOUTH COAST LAND CO., GEORGE BUXTON, SALES AGENT, CARLSBAD, CAL.

For Sale or Exchange—Delightful home place, South Pasadena, good 6 room house, garage, chicken coops, etc. Lot 75x320, bearing walnut and fruit trees of all kinds. Cash value \$6500 clear, or will exchange for ranch at or near same value. P. O. Box 440, South Pasadena, Cal.

For Sale—Tulare 40 acre dairy and hog ranch, 3 miles from Tulare, 1/2 mile to school on oil road and R. F. D.; good pumping plant house, barn, outbuildings. Will give good terms; might consider part trade. For particulars address Box H, care Cultivator.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

Do you want a hog ranch? If so and you have a little money, write for my proposition to start you. E. A. Stephens, 945 Orange St., Los Angeles.

DUCKS

Ducks—High class Mammoth Imperial Pekin Ducks for breeders. Best stock in California. Stone Canyon Poultry Farm, near Sawtelle, Calif. P. O. address Sawtelle. Sunset Phone, Santa Monica 565-M.

"WAN BEEG WET FOOL"

Declaring that "Life's not worth living. I'll end it all," Giovanni Menotti threw himself into the river in the presence of Rose Bessoni who discarded his proffered love.

Both Menotti and Miss Bessoni are members of a gypsy band. The affair might have had a tragic ending, but the water was only knee deep and Rose taunted the would-be suicide with being "wan beeg wet fool."

NO REWARD FOR PASSENGER PIGEONS

Recent widespread newspaper accounts to the effect that the United States department of agriculture is offering \$10,000 reward to the person finding a passenger or "wood" pigeon nest containing two eggs, resulted in hundreds of letters being sent to the department. The report is not based upon facts, as the department has offered no such reward, and there is every reason to believe the passenger pigeon which formerly roamed the country in flocks of millions is extinct. In 1910 about \$1,000 in rewards were offered by the Clark University for the the first undisturbed nests of the passenger pigeon to be found in the United States. This was a great stimulus to action. The hunt for this pigeon was fruitless. The offer of rewards was renewed for several years until it was fully established that the pigeon was extinct.

The passenger pigeon up to 1885 ranged the American continent east of the Rocky Mountains. The mourning dove has often been mistaken for the passenger pigeon, which in a general way it resembles. However, this bird is quite distinct from the passenger pigeon; it is shorter and has different color markings.

The press reports stated that the now extinct passenger pigeon was valued because of its usefulness in destroying the gipsy moth and other moths and pests which are doing millions of dollars of damage. Although the preservation of this pigeon is much to be desired, it would be of absolutely no value in eliminating the gipsy moth, as the pigeons are almost entirely vegetarian in their diet.

PERCHES

Perches should not be placed more than two feet from the floor of the roosting house; indeed, for the heavier breeds of fowls 18 inches will be quite high enough. They should be placed far enough apart to allow the birds to descend from them with ease.

Perches placed too high are likely to cause bumble-foot and they are also likely to account for internal rupture, a very serious ailment in laying hens. The fowl roosting in a high tree has a better chance of descending in safety to the earth than has the bird whose perch is placed high up in a poultry house. The former has space in which to perform a gradual descent, while the latter is forced to descend in a more perpendicular manner.

Let the perches be placed as recommended above, and have them all on one level, for when they are placed at varying heights the birds make for the highest one, with the result that there is quarrelling and overcrowding. To roost high seems to be the natural instinct of all fowls, but for their own safety they should be under the control of their owner.—Farmers' Review.

Gather the eggs twice a day in hot weather if possible. Often the hen house becomes so hot in the afternoon that eggs in it are soon brought up to the degree of heat when the germ begins development. That means short-lived freshness. The better way is to prevent fertile eggs, but where that is not done extra care should be taken to prevent the change that begins at about 90 degrees.

Have two or three late hatchings. Pullets hatched late will begin laying in the winter.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Peafowls Dying

Have lost several peafowls when about four weeks old. Do not know what the trouble is but they open their mouths and seem to gasp for breath. Remedies given fail to bring relief. Have been feeding pheasant food.—Subscriber, Los Angeles.

The gasping for breath, if there are no other symptoms, suggests the presence of gape worms in the trachea, but you can only be certain that this is the trouble when you have found the worms. A gape worm extractor may be purchased at any good poultry supply house, or you can make one out of a hair from a horse's tail, bending it in the middle and making a loop. Open the bird's beak carefully and hold it open with the thumb and fingers of left hand, while with the right you insert the extractor and press it downward into the windpipe. Give it two or three quick turns and withdraw at once or you may suffocate the bird. If there are gape worms, two or three trials will bring some of them up, but you may kill the bird before you learn how to extract the worms. It is said that sometimes salicylic acid in the drinking water (15 grains to a quart of water) or salicylate of soda (three drams to the quart) will effect a cure without the use of the extractor, and I should certainly try one of these remedies first. In any case, remove the birds to absolutely clean ground, where chickens have not been for a year or more, and see that they have plenty of green food and fresh air at night. I do not know the ingredients of pheasant food, but the most successful breeders of peafowls feed the young birds as they would young turkeys, on rolled oats, hardboiled egg, stale bread, cottage cheese, cracked wheat, chopped onion and other greens.—J. A. K.

Fleas

In your issue of August 15 you answer inquiry of M. A. B. regarding method of ridding a place of fleas. We have been through the same experience and got rid of them completely by going over barns and corrals and between houses and barns with an ordinary sprinkling can filled with a cheap grade of distillate. It seemed as if there were millions of fleas, but one application did the work and did it quick.—C. H. Bigger.

Keeping Sweet Potatoes

What is the best method of keeping sweet potatoes over winter for seed? —Subscriber, Laton.

Cold storage without doubt would be best. The next best method would perhaps be to lay on racks in cool, dry place, allowing air to pass freely over them. Some keep them in dry sand but this is declared to be expensive and not a sure way. The following method is recommended in Wickson's "California Vegetables": "Take stout stakes, say five to six feet long and drive them into the ground in a row and five feet apart in some dry place that is not sheltered by trees. Dig the potatoes and throw them up around the stakes to the

height of four feet. For a large field a great many such rows may be necessary; for a small patch perhaps one single stake will suffice. When all dug, put on four inches of straw as covering. After a week or ten days, according to the weather, the potatoes will have undergone a sweating process. They first cover themselves with moisture as if they had been dipped in water. This moisture gradually begins to disappear, and as soon as it does so it is time to throw off the straw. This should be done when the wind is blowing; the potato hills should be left open for three or four hours, or until the potatoes appear entirely dry. If the straw covering is taken off in the morning the potatoes will be dry at noon. Then cover them again with three or four inches of fresh, dry straw and on top of the straw put three or four inches of soil to keep out the cold. On the top of this must be placed a roof which is easily made of shakes nailed to strips of two by three and made in the shape of panels to allow of easy handling and of repeated use year after year. Potatoes kept in this way will preserve perfectly until next spring. Very few, if any, will be found decayed."

Cabbage Worms

Is there any method of control of cabbage and tomato worms besides hand picking?—Subscriber, Lodi.

The so-called cabbage "worm," which isn't a worm but is the caterpillar of a butterfly, is rather difficult to handle. It lives on various plants such as brussels sprouts, cabbage, cauliflower, mignonette, mustard, nasturtium and a large number of others. Essig's "Injurious and Beneficial Insects" gives the following method of control: "The larvae, working as they do into the heads of the cabbages, make control measures practically impossible after they have once begun. Young plants may well be protected by arsenical sprays which are applied with safety until the heads are half-grown. Clean culture should be practiced and no cabbage or host plants allowed to grow during the interval between crops unless they are freely sprayed with strong solutions of arsenicals. Spraying with white hellebore kills the caterpillars without danger to the plants or the consumer. Fortunately most of the cabbage grown in Califor-

nia is raised near the ocean, during the winter and is usually quite free from this pest." Method of control for tomato "worm" is much the same.

Skin Troubles

Referring to an inquiry recently answered by Dr. Petrie regarding skin trouble affecting horses, especially where small lumps had formed on the neck, shoulders and back and the hair came off, an Imperial Valley subscriber writes that he has a horse similarly affected, in fact, he sent an inquiry to the veterinary department regarding his mare, which is smooth and fat and in good condition during cold weather, but as soon as the intense heat of the summer begins her skin breaks out as it would with mosquito bites. He thinks the trouble is quite general in the hot interior valleys, and believes that where a horse is affected in this way it should be disposed of to some coast section or somewhere where cooler summer weather prevails.

Renewing Old Walnut Grove

I have just purchased a 20-year-old walnut grove. The trees are not thrifty, they show much dead wood in the tops. The soil, which is light, even sandy, has been more or less exhausted by intercrops. What fertilizers and what soil treatment will renew this grove without too great expense?—Newcomer.

It is very difficult to make a paying walnut orchard from trees which have been neglected for many years. The orchard just mentioned will require several years of close attention and considerable expense.

The soil being light and having been reduced in fertility by cropping between the trees will need something to restore the humus and most likely this can be done best and quickest by using stable manure at the rate of 10 to 15 tons per acre each year for three or four years. In the meantime green manure crops should be sown each year as soon as the walnuts are gath-

ered and this crop plowed under while green with the addition of 500 pounds of superphosphate per acre broadcasted just before plowing. Very severe pruning must be done, taking out all the branches showing dead wood along the upper side and all the branches through the trees. This may be enough to start a new and vigorous growth with the fertilization but if the trees are planted only 40 feet apart it might be well to take out the alternate diagonal rows of trees which will leave them in squares about 56 feet apart and one-half as many trees on an acre. All the cuts where branches two or more inches in diameter are removed should be painted with a heavy mineral paint or with a paint made by dissolving asphaltum in gasoline. A coat of paint should be applied each year until the cuts have grown over. All the decayed wood should be carefully taken out whether caused by sunscald or by branches cut off and not protected by paint. The holes should then be filled with cement mortar within one-fourth inch of the bark and all painted over. Special care must be given to irrigation and the soil never allowed to become dry. Do not put on more water than will wet the soil four feet deep within 24 hours after the water has been applied but put it on often enough to keep the soil damp, without reference to the time between irrigations—J. B. N.

the Cultivator Poultry Book

Poultry for Profit

by

Jean A. Koethen

PACIFIC POULTRYCRAFT SAYS:

A brand new book on poultry published by that old reliable Cultivator Publishing Co., Los Angeles. The author, Jean A. Koethen, has really written a poultry book worth while. The different subjects are treated with a directness that is refreshing, after reading so many books that say so much and mean so little. The book is intended for the beginner and farmer, but we commend it most heartily to anyone interested in poultry; whether for pleasure or profit; it is full of good things from cover to cover.

THE LOS ANGELES TIMES SAYS:

The author of this manual has covered the subject fully, giving the salient features and practices of an enlightened poultry culture as it applies to California conditions, based largely on personal experiences, and intelligent compilations from recognized authorities.

THE RIVERSIDE PRESS SAYS:

The Press is in receipt of a copy of this work, called "Poultry for Profit," and has no hesitation in commending it to either the "backlotter" who keeps a few chicks for his own pleasure, to the fancier who works to the "standard," and to the commercial poultryman who makes a business of poultry culture. Before its publication, the manuscript of "Poultry for Profit" was submitted to practical poultrymen, to experts and simple poultry enthusiasts, and all agreed that it was more comprehensive, more readable and vastly more helpful than any similar poultry book yet published. It covers the widest range, discussing breeds, feeds, diseases, housing, marketing and answers the thousand and one questions that even the expert poultryman sometimes has to ask and the amateur is ever asking.

THE PORTLAND OREGONIAN SAYS:

The Weekly Oregonian takes pleasure in recommending this book to its readers, for it is "the right stuff," told in the right way by the right woman.

"Poultry for Profit"

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

An outline of its valuable information—

Making a Beginning	Housing and Yarding	Incubation
Brooding	Feeding	Breeding
Marketing	Sanitation and Hygiene	Fixtures, Conveniences
Diseases and Vices	Ducks and Geese	Turkeys

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on eggshell book, binding full cloth vellum de luxe, at the price of one dollar postpaid.

\$1.00 Postpaid to any address.

\$1.75 with the California Cultivator, weekly, one year.

The Cultivator Publishing Co., Inc.

115-117 N. Broadway

Los Angeles, Cal.

The Household Department

A BYWAY

The highway marches sturdily to market town and mill,
But I would find a little road that loiters up a hill—

A little vagrant, woodland road, gray-ribboned through the green,
Where berry brambles bar the way and orchard elders lean.

The highway is the world's way, but I would drop behind
To follow little luring paths that only laggards find;
The challenge of the bandit weeds, the tilt with startled bees—
What can the dusty highways give for tourneyings like these?

The highway is the sun's way, and follows east to west,
But there are yellow, vagrant beams that love my road the best—
That linger down the valley ways where lady's lace is spread,
Or slant through shady orchard paths and tint the tree trunks red.

The highway, the highway!—you follow where it calls;
I watch you through a leafy screen from crumbling orchard walls—
I wait and smile among the green and know that by and by
We'll lure you back through dust and dew—my little road and I!—

Margaret Lee Ashley in Harper's Magazine.

THE HOUSEHOLD CONTESTS

THE present week's recipes we believe are among the best and most practical our housewives have contributed. What kind of recipes would you like next for the October contest? Please write and tell us.

For the September contest we will turn away from recipes and follow the suggestion of Mrs. F. A. Marks of Los Angeles who writes:

"For some time I have had in mind to suggest that Saturday's work be made a subject for once. Saturday is a busy day for housekeepers, with the extra cooking, a final touching up of the home for over Sunday, and other duties that come in on that day. Have some of the efficient women worked out a plan that makes it less arduous and exhaustive and less to be dreaded? If so, do ask them to pass it on."

Cash Prizes

For the best short article along the line suggested in the above paragraph, \$2.00 cash; for the second best, \$1.00. Please write on one side of paper and send in your communication early to Household Department, California Cultivator, Los Angeles. All should be in this office by Thursday morning, September 9. Articles will appear in the issue of September 16.

All whose articles are published will receive three months' extension of subscription if they have not already received such extension this year. With your article send name and address of member of your family now receiving the Cultivator that the extension may be properly credited. Or, of course, a new subscription may be started instead.

PRIZE WINNERS

Winners of the cash prizes this month are M. Louise Berneike first; Ella M. Tarbet, second. We did not ask for articles with the recipes, but these are so good and the recipes with them so excellent that the cash

prizes were awarded to them. The other contributions also are awarded prizes in the three months' subscription to the Cultivator.

NEW WAYS OF COOKING VEGETABLES

Written for California Cultivator
By M. Louise Berneike, Santa Ana

The cooking of most vegetables may be greatly facilitated and the flavor retained by a procedure which seems to be little known. The writer's attention was first called to this method by a recipe for making a vegetable soup. The recipe proved to be fine and was somewhat as follows: Two-thirds teacup each of diced carrot, turnip and potato. One small onion finely sliced. Three or four parsley leaves, one tablespoon of olive oil or other fat. Melt the fat in the cooking vessel. Add the diced vegetables in the order above named. No water save that which adheres to the diced vegetables as taken from the rinsing water. The easiest vegetable to cook is placed at the top. Sprinkle over them a teaspoon of salt and a little pepper. Cover very tightly and cook five to ten minutes without removing cover. Listen for the sound of frying in the kettle and immediately add boiling water to cover the vegetables. They should not brown. Let them cook a few minutes longer unless already tender. Pass all through a sieve together with a sliced tomato. Add boiling water through the sieve while washing the vegetables to make a quart of soup. Return to the kettle to keep hot till served. Add more salt and pepper to the taste, but do not boil, as the flavor will be impaired.

Try it. You will want more. Vary the soup by using or adding other vegetables as chiles, sweet potato, Jerusalem artichoke, and so forth.

Here, by the way, is a suggestion: Jerusalem artichoke is a fine vegetable in soup, as well as stewed.

Curiosity led me to investigate the contents of the cooking kettle after about two minutes of cooking. The amount of liquid present was astonishing, evidently the juices of the vegetables were withdrawn by the combined action of heated fat and salt, while the closed cover retained the steam. But the most astonishing feature was the rapidity with which these vegetables were cooked. Ten minutes sufficed to make them perfectly tender.

Then came the question, why not apply the same principle to the cooking of vegetables in general? In short, it was soon proved that peas, beans, string beans, sliced carrots, turnips, chayote, cucumbers, and so forth can be stewed in this way with great facility. Ten minutes suffices to cook peas perfectly tender. But remember to add boiling water on removing the cover—never cold water.

With dried beans, peas or lentils, one must first soak them over night in cold water. Turn this off and add fresh cold water in the morning, with one-fourth teaspoon of baking soda to each pint of dried beans used. Let them gradually heat and then boil till the yellow color is withdrawn from beans. Pour off this water and rinse the beans with a little boiling water. Add a tablespoon of olive oil or other

fat and a teaspoon of salt for each pint of dried beans used. Stir until the hot beans are all coated with fat, add half a teacup of boiling water, cover very closely and cook until frying commences, then cover well with boiling water and continue boiling briskly till beans are done which will not be over half an hour unless the beans are very old. A very small onion sliced and added together with a parsley leaf when the fat is first mixed with the beans is greatly relished by most people.

Spinach, lettuce, beet leaves, or other greens are best and most quickly cooked in a tight vessel with no water save that which adheres from the washing. They are so succulent that no fat is needed to assist the process.

The flavor of most vegetables is far better when cooked in this way, perhaps because the flavor is not lost by long boiling. But one must never forget to have boiling water ready to add to hot vegetables. Cold water has the same effect on them as on flannel clothing. It shrinks them and consequently toughens them and lengthens the cooking process.

VEGETABLES FOR SERVICE

Written for California Cultivator
By Ella M. Tarbet, Onarga, Illinois

The nutritious value of vegetables and their healthfulness as a food are largely determined by the method by which they are cooked. Of course a vegetable should be fresh and sweet or if canned goods have to be used a good brand must be selected. Do not overcook vegetables, for this renders them unpalatable and unwholesome.

Succulent vegetables give tone to the blood, nerves and digestive apparatus when they are properly cooked and masticated. A starchy vegetable such as potato, rice or macaroni, and a green vegetable such as carrots, spinach, squash or onions are sufficient to cook for dinner, and if supplemented with a fresh green vegetable served raw as a salad, the kinds being selected as most appetizing in combination with the meat or main dish, the housewife will find she is planning a balanced meal.

Celery contains sulphur and helps to ward off rheumatism. It is also a nerve tonic. Onions aid in the cure of nervousness, and are excellent for colds and coughs. Asparagus stimulates the kidneys. Cabbage helps purify the blood. Tomatoes are good for a torpid liver. Spinach is good for constipation, is often called the "broom of the stomach." Parsnips and carrots possess the same properties as sarsaparilla.

Corn Fondue

Mix well together one cup of milk, one cup of breadcrumbs, one cup of corn, one cup of grated cheese and one level tablespoon of melted butter. Season with salt, pepper and a dash of paprika. Then add the yolks of two eggs which have been well beaten; lastly fold in carefully the stiffly beaten whites of the eggs. Bake in individual molds or baking dish. This is a good meat substitute.

OUT ON ONE COUNT

After preaching a sermon on the fate of the wicked a clergyman met an old woman well known for her gossiping propensities and he said: "I hope my sermon has borne fruit. You heard about the place where I said there shall be wailing and gnashing of teeth?"

"Well, as to that," answered the dame, "if I 'as anything to say, it be this: 'Let them gnash' teeth as has 'em, I ain't.'"—London Opinion.

MORE NEW RECIPES

Baked Asparagus and Cheese

One bunch asparagus, two tablespoons butter, three tablespoons flour, one-fourth teaspoon salt, one cup asparagus juice, one-half cup milk, one egg and a few buttered breadcrumbs. Scrape, wash and cut asparagus in one-inch lengths, cook in boiling water until nearly tender, drain. Make a white sauce of butter, flour and milk, add beaten eggs and cheese. Cook till cheese melts, add one cup water from juice. Place asparagus and white sauce in alternate layers. Sprinkle over buttered breadcrumbs. Cook till brown on top.—Lola De Lefturch, Inglewood.

Filled Cabbage

Hollow out a large, firm cabbage leaving it about one or two inches thick, then fill with round steak that has been run through the food chopper and seasoned with salt, pepper and butter. Place the core on top, also some of the large leaves. Tie these on tightly so that the meat will not come out, then place in boiling water which has been salted. Cook about two hours or until cabbage is thoroughly done. Serve with melted butter in which nutmeg has been grated. It makes an appetizing and artistic dish to place the cabbage in the center of a chop plate and garnish with mashed potatoes, chopped beets, carrots and parsley.—Mrs. R. K. Glasscock, Simi.

Delicious Creamed Cabbage

Chop coarsely one head of cabbage and cook ten minutes in boiling, salted water without covering; drain, mix two level tablespoons of butter with two tablespoons of flour and add half pint of liquid from the cabbage, one cup of scalded milk and salt to taste. Stir over fire until thick. Place alternate layers of cream and cabbage in baking pan, sprinkle with stale bread crumbs and brown in oven.—Mrs. H. W. Schroeder, Marshall, Minnesota.

Cauliflower (French Style)

A French method of preparing cauliflower is one of the most appetizing I know. Boil cauliflower in salted water or use pieces of cooked cauliflower which have been left over. Mash it with a quarter of its bulk of grated cheese; season with salt and paprika and mold into a ball. Place in a baking-dish and cover with a thick cream sauce and brown in a hot oven.

For the sauce use two tablespoons of butter and two tablespoons of flour to a cup of milk.—A. C. Harris, Bowles.

Celeriac Salad

Boil two medium sized celeriac roots in salted water until tender; peel and cut in dice. Arrange on crisp lettuce leaves with tiny cheese balls made by mixing finely chopped walnuts with twice their bulk of cream cheese, adding a little thick cream, seasoned with salt and pepper. Sprinkle finely minced red sweet peppers over the salad and serve with a dressing made with six tablespoons of olive oil, half teaspoon of salt, six drops onion juice, one-fourth teaspoon of paprika, to which has been gradually beaten in three tablespoons of lemon juice.—Mrs. C. B. Kirkpatrick, Los Angeles.

Fried Corn

After washing and removing silk from the corn, cut from the cob. Melt sufficient butter in saucepan to well coat the corn. Put in corn, stirring well to get it all covered with butter. For six ears of corn, take one small bell pepper, from which the seeds have been removed. Chop, put into corn with about one tablespoon of water, cover closely. Cook over a slow

Gas Stove Convenience with Kerosene

Hot in Your Kitchen?

No need of it if you cook with a good oil stove. The heat is concentrated on the cooking—not radiated throughout the room.

New Perfection Oil Cook-Stove

For Best Results Use Pearl Oil

Abundant heat—always ready at the touch of a match—like gas. Can be turned out the minute you finish cooking. Cooks anything your wood or coal range does—and there's no heavy hods to lug—no dirt or ashes. No odor. Does not taint the food. Ask your dealer. See Exhibit, Palace of Manufactures, Panama-Pacific Exposition.

fire, stirring often to prevent sticking, about fifteen minutes; season when removed from the fire.—Miss E. R. Salisbury, Los Angeles.

Fried Corn

Here is a way to prepare sweet corn which is very fine: Brush and silk it as for boiling (when it is just in the milk.) Have a large pan and a sharp knife, cut off the tips of the grains, scraping the rest out, then fry three slices of bacon. Fry the corn in the grease with enough salt and pepper to suit taste. Turn it as often as it browns with a pan cake turner. Takes twenty minutes to half an hour to cook it done.—Mrs. Carrie B. Kuhnert, Merced.

Eggplant Loaf

Remove the skin from a good sized, firm eggplant, cut in small pieces and boil until tender and soft. Drain and mash. Chop fine or put through meat chopper a half pound lean, fresh pork. Add this to the pulp of eggplant and mix thoroughly. Then add a teaspoon of melted butter, pepper, salt, a bit of paprika and two well beaten eggs. Form the mass into a loaf and

HAY

Under date of August 14, 1915, Scott, Magner & Miller say: Receipts of hay for the week have amounted to 3765 tons. The above was sold off to good advantage. A few consignments of fancy wheat hay have been coming in recently. This was quickly placed. A steamer is now receiving hay purchased in this market for the government of Australia and another steamer has been chartered to load a cargo at this port for the same destination. This hay is especially prepared and repressed into the smallest possible volume on account of freight charges. Exportations to Australia during recent months together with other heavy export orders have taken vast quantities of hay and this is bound to result in benefit to all.

The harvest continues in active progress. Much hay is being put into storage. The arrivals of alfalfa continue to be light and the market very steady. There is considerable movement in alfalfa in the interior and the market feeling is apparently a little stronger than heretofore. Straw continues dull and uninteresting.

We quote the average wholesale price of hay in carload lots on today's market as follows:

Fancy Wheat Hay (lt. bales)	13.50@14.50
No. 1 Wheat or Wheat and Oat	11.50@12.50
No. 2 Wheat or Wheat and Oat	8.50@10.00

Citrus Fruit Market

LOS ANGELES, August 18, 1915.

The orange market makes glad the heart of the Valencia grower. There yet remain only about 2000 cars of Valencias to go, and from present appearances there will be good demand up to November.

Notwithstanding the slight impetus given to the lemon market by the few days of hot weather there was another serious sag when the cooler weather returned, and the most discouraging condition prevails in nearly all markets. During last week there were only about 36,000 boxes of foreigners afloat, and 30,000 of these will be cleaned up during the coming week, but notwithstanding this the speculators and larger dealers refused to purchase in any large quantity. It is generally believed that there will be no very active lemon market this season.

Shipments

Shipments of oranges from Southern California to date since November 1, 1914, 30,894, lemons 5810, total 36,704. To same date last season: oranges 35,022, lemons 2568, total 37,590. From Tulare County this season: oranges 5649, lemons 3202, total 5851. Last season same date: oranges 5875, lemons 30, total 5905. From northern counties, oranges 630, lemons 2. Last season same date: oranges 404, lemons 5.

NEW YORK, Aug. 16.—Sixteen cars Valencias, one mixed car and seven cars lemons sold. Market lower on oranges, lemons active, higher. Fair.

HANDBOOK OF BLASTING

The DuPont Powder Company of Wilmington, Delaware, has just from the press a new "Farmer's Handbook of Explosives." It is practically complete as to methods which may be employed in blasting out stumps, breaking up rocks, opening hardpan formations, or any other agricultural use of dynamite.

BILLIKEN HERD

Mr. C. V. Cunningham of Mills, Sacramento County, has sent us a leaflet regarding his herd of registered O. I. C. swine. It is a fine showing of the worth of this old-time favorite of the Middle West. In addition the leaflet contains some most useful suggestions for the swine breeder. We doubt not it will be sent for the asking.

NEW RECIPES

(Continued from Page 189)

bake in a buttered dripping pan or a buttered baking dish. Which ever way the loaf is baked it should be covered with slices of salt pork and baked until the pork is a rich brown. —Nita Ferris, Woodlake.

Stuffed Eggplant

Select full grown egg plant, cut off the top and remove the inside, leaving the shell about one half inch thick; chop the part removed very fine and add an equal amount of well seasoned mashed potatoes and a few bread crumbs. Put a little butter in a frying pan and when hot pour in the mixture and let cook about 15 minutes, stirring to prevent burning. Fill the shell with this and cover the top with the piece which was cut off and bake in a moderate oven half an hour. —Miss D. N. Parker, Caruthers.

Eggplant Cakes

Wash eggplant, slice about one haif inch thick then peel the outside off. Cook in kettle with small amount of water and a pinch of salt until tender. Put in colander and drain well, mash, beat in one egg and a small amount of flour until a stiff batter is formed. Drop in small cakes in hot drippings or lard. These are very nice for breakfast.—Mrs. E. Robertson, Los Angeles.

Spinach and Carrots

Spinach with carrots make a nice entree. Peel three carrots and cut into two inch lengths. Boil in salted water until tender; drain; cut the center from each. Mix four tablespoons of chopped cooked chicken, two tablespoons chopped cooked ham, one tablespoon bread crumbs, one teaspoon of chopped parsley, one tablespoon white sauce and one egg yolk. Season with salt, pepper and nutmeg. Cook until hot. Fill centers of carrots with this mixture, place in buttered pans and bake 15 minutes. Arrange 2 cups of hot chopped cooked spinach in shape of a pyramid on a hot dish; season and surround with baked carrots. Decorate with onions and pour hot gravy around.—Miss A. Butcher, Healdsburg.

Spanish Squash

Peel and cut in small pieces tender summer squash. Heat a large spoon of drippings in stew pan; add to it the squash; also one finely sliced onion and a large tomato cut up with pepper, salt and a bit of butter. Stir constantly, cooking in its own moisture. Delicious.—Mrs. O. P. Hart, Hermosa Beach.

Turnips and Peas

Peel turnips and boil whole. Prepare peas, cook and season for the table. When turnips are tender remove from the water, scoop out centers to form cups; place on a platter or in shallow dish. Fill cups with the peas and place in the oven until the rest of the meal is ready, then serve at once. This is very easily prepared and is delicious.—Miss Elvin Follensbee, Chino.

Fried Summer Squash

Wash young summer squash but do not peel. Slice one quarter of an inch thick. Sprinkle with salt and let stand about half an hour. Take dry bread and brown in oven, then grind in food chopper and sift through sieve about as fine as a flour sieve. Dip the squash in beaten egg, then in fine bread crumbs. Fry slowly to a delicate brown.—Mrs. J. F. C., Hemet.

A POULTRYMAN'S PARADISE

(Continued from Page 185)

eggs, to make a container similar in shape to a wash boiler, in which the eggs could be placed on trays one above the other, and to set it in a rectangular tank. The water should come up as high on the outside of the container as the eggs are inside, and it would be necessary to cover the whole thing or to have it under a roof lest the heat of the sun affect the temperature. It seems to me it would be very easy to work out a scheme of this sort, and the expense would be trifling. The main question is that of temperature. If the water is run directly into the tub at 106 degrees, what will the temperature of the egg chamber be? The temperature of a sitting hen is 105 or 106 degrees, and her eggs are never overheated. What loss of heat will there be when the water is run around the egg chamber? I see no way of finding out except by trying, and this is why I should experiment at first with a few eggs. It may be necessary to cool the water a little before it enters the tub, or to place the container at some distance from the point where the water enters to regulate the amount of water used, so that when more heat is needed, more water can be let in.

Several very nice questions enter into the planning of such an incubator, but that it can be worked out I don't doubt for a minute. The outside weather has always to be reckoned with. If it were not for that, uniform temperature of water would mean uniform temperature in the egg chamber. Then there is the matter of moisture, but it seems to me the air which enters the ventilating holes should be sufficiently moisture laden, after passing over the warm water below it, to keep the air in the egg chamber moist enough, even for Imperial Valley. But then again I do not know just how much humidity there is in the air there. Maybe it is humid enough, just as it is, and the water passing around the egg container would have to be covered to keep the chicks from drowning. One gets into a bottomless sea of speculation if he begins to reason. The best way is to try and see how the eggs hatch. I hope Mr. Brunner will let us know how he succeeds.

The conceited man is certainly an I specialist.—Rural New Yorker

"Creeping Grip" Tractor of General Utility

Tractors of moderate size are proving their great utility and giving good results to the grain rancher as well as to the bean and beet grower. The Bullock Creeping Grip Tractors, equivalent of six to eight horses on soft ground, are delivered to Southern California ranchers for \$1100.00, freight paid by Bullock.

How would you like a Tractor that will do your plowing with 3 14-inch bottom plows, operating on cheap fuel, No. 1 distillate, consuming one and one-half gallons per hour and during that hour plow one acre? This performance may be a gauge to you of other work that may be performed with this Bullock Creeping Grip Tractor that sells for \$1100.00.

The purchase of this moderate size Tractor will prove a profitable investment. The first cost is less than the equivalent power in horses; the operating expense is far less than the horse equivalent and no expense is entailed while idle.

The "Creeping Grip" has that oscillating feature combined with a perfect balance that enables it to traverse rough, uneven ground, and at all times maintain its grip. The traction is perfect, there is no slippage.

On exhibition in Los Angeles.

Catalogues of this and larger size tractors for the asking.

Final Telephone Efficiency

YOU can get it from the instrument shown here. One of the Kellogg kind. Works on any kind of a line and with any kind of telephone. Rings clearly with 40 telephones on the line. Compact, durable, light. Less wall space. Unbreakable receiver and mouth piece. Lightning arrester. Secret service push button to ring Central without ringing neighbors. No repair bills. 5 year guarantee on transmitter.

KELLOGG Telephones Best in the World

because they are made in the largest independent factory in the world and have to undergo the most rigid tests ever devised. There are 37 of the tests and none but a Kellogg made instrument could stand them.

Why not know real phone service. Why take chance on cheaper instruments that only mean in the end repair bills and the uncertain weak transmission of messages that is maddening. The telephone is the greatest aid in the world in linking up the lines of country people with the whole world, but the country man of today wants the best telephone. Send us your name and we'll prove to you that there is a reason for Kellogg world-wide reputation. Also will see that you get much valuable and interesting telephone information free. Jackson
MADE

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

Books

This list is prepared with the purpose of enabling our Cultivator readers to supply themselves with standard books at lowest possible prices. We call especial attention to a few of the new publications. "Citrus Fruits" by Professor Coit, of the University of California, covers all phases of the Citrus Industry under California conditions—the kind of a book we have had many calls for but never before been able to supply. "Productive Feeding of Farm Animals" by Woll, will command special attention. "Poultry for Profit" (The Cultivator Poultry Book) by Koethen, another California book, is new and excellent, telling what to do and what not to do with poultry in California; a sure guide to poultry success. The new Standard Encyclopedia of Horticulture, by Bailey, is not equalled by anything of the kind which has ever been published at any time in any language. Special terms of payment and discounts are offered by the publishers through us on this Encyclopedia. Write us about it.

Summer Care of Heaters

J. E. Adamson of Pomona Writes for the Cultivator Valuable Suggestions on Caring for Heaters. Their Lives are Short at Best. Good Suggestions for More Efficient Frost Fighting

TWO seasons of mild weather have produced a feeling of ease and safety as regards frost in the minds of the growers of citrus fruit. There is little tendency to talk of frost or the means of prevention, and in some cases there is even the apathy which leads to neglect of the apparatus used in the former fight. Most of the neglect is to be found in cases where the apparatus was not installed until after the troublous times of 1912-13. Growers who made the fight and won are generally still alive to the needs of the situation, and are ready to make as good or a better fight the next time danger comes.

There would seem to be little excuse for the deliberate neglect of heaters. The labor of caring for them is not a serious matter even though the most detailed care is given them. Some growers go to a good deal of unnecessary work, such as scraping out the refuse left in the heaters, burning them out, etc., before painting. If the refuse has a considerable proportion of asphaltum in it this will in a large measure act as a preservative.

Paints of several kinds have been offered the growers under the claim of being fireproof, but most of these have turned out to be a delusion. Practically all of them are based on asphaltum and will either burn off or, after being subjected to high temperatures, will shell off.

There would seem to be no better

paint than heavy crude oil applied hot. It will need renewing each year but will stick well and preserve the sheet iron of the heater until it has been burned several times. I know of one lot of heaters which were emptied and then piled in such a manner that

breakage. On our own place we left the heaters in the field last year, but took them in this year and find the cost of taking them up is not greatly in excess of that of setting them back under the trees. There is also the advantage of having the heaters

the stoves, as there is very little tendency to rust deeply on account of the large amount of carbon in the iron. Then also the ideal heater will have the oil fed through pipes and will not be required to be oil tight.

Sheet iron or steel stoves could be used for the pipe system, but would not last long for the reason that sheet steel goes down more rapidly when subjected to high temperatures, as they are in the piped system. The cuts show the cast iron stoves as far as they have been worked out. While in operation the whole stove is red hot, a condition that materially helps the combustion and holds the radiation down near the ground where it will do the most good. It will be noticed that the stove is in two parts, the lower one being a flat plate with legs. The joint being at the bottom no water can accumulate to make trouble when lighting the fires.

The problem seems to be largely a matter of first cost as the cast iron construction calls for a much heavier stove than we are used to. This is offset by the simple form and absence of complications such as dampers, covers, draft tubes, or other items found in the air-tight stoves.

The system commends itself in that there is no oil to care for when the heaters are taken up in the spring and no slopping of oil while filling, as there is no filling to do except at the main tank.

Latest Form of Orchard Heater

the drippings from the upper tiers would flow over the lower ones. Oil was then thrown over the pile several times until the heaters were all well coated. These heaters are three years old and are in good condition, the only loss in that time being caused by

brought under inspection and put in good condition for the next year.

The matter of rapid oxidation of the sheet steel heaters has caused us to look for something more permanent for the heater of the future. This leads us to the use of cast iron for

Early Preparation for Frost Fighting

J. W. Garthwaite of Corona Gives Suggestions of Value in Fitting and Maintaining Frost Fighting Appliances

HAVING placed his order with the manufacturer in the summer for early fall delivery the orchardist will do well to make all his plans for placing his heaters and have everything in readiness when they arrive, because unless the manufacturers have made a very decided change in their methods, the equipment will appear just after the first cold weather and it will seem desirable to rush it from car to field without delay.

In preparing for the placing of heaters the grower should bear in mind that they are constructed of light sheet iron and that rust is their worst enemy. In fact with reasonable care in handling they should last until they have rusted out or until they have been burned through. This last danger can be guarded against by not permitting the heaters to burn dry; under severe weather conditions this

might present practical difficulties, but under no circumstances should it be allowed if possibly avoidable. Delaying of rusting out is merely a matter of care. Dipping in some rust proof material is very useful and important as far as it goes and should be done before the heaters are first put in the field and, if they are stored for the summer, should be done each time they are collected and again before distribution. More important, however, appears the necessity for protecting the bottom of the heater from the damp ground of the orchard. This can be done by setting it on some substantial base. Bases in three forms have come under the notice of the writer. First, a block of concrete large enough to accommodate the heater and about one inch thick. Second, a piece of redwood of similar dimensions, cleated at each end to prevent warping, and dipped in fireproof

paint. Third, a piece of galvanized corrugated iron of fairly heavy gauge. These bases have the added advantage of keeping the heaters level, which is highly important if they are to be filled without spilling or running over. The third form of base permits a circulation of air which is claimed to be beneficial and is virtually indestructible, while the concrete is porous enough to absorb a surprising amount of oil. In the beginning a few growers set their heaters in pans to catch any oil that might be spilled, but when, with the first rains, these filled with water they were discarded.

Most of the heaters that are being made at present are provided with some sort of indicator to show the man who is filling when the proper amount of oil has been poured in; if the heater is set level and the mark watched there should be little danger of spilling. Some of the heaters turned

out hurriedly after the freeze of December, 1911, were not provided with any such mark and one of the growers in this district designed a gauge for this purpose. This is made of fairly heavy galvanized wire hooked at one end and bent into the shape of a "T" at the other. The hooked end is hung over the top of the chimney and the whole is of such a length that when the oil is poured into the heater until it touches the "T" end it is within half an inch of running over.

It is usual for the grower to secure sufficient equipment so that in the absence of very severe conditions it is unnecessary to light all of his heaters at any one time. Frequently the system is to light every other heater in each row. When this is done the lighting should be staggered so that each dark square will have lighted squares on all sides. In order to facilitate the carrying out of this plan

John Deere Implements

A New Book
Free

Just Off the Press

Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions. It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements: Steel plows, cultivators and harrows; corn planters, disc harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side delivery rakes; motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasoline engines.

To get this book free, state what special implements you are interested in and ask for the book as Package No. X-111.

John Deere Publicity Department, Moline, Illinois

John Deere Spreader

The Spreader with the Beater On the Axle

The beater—the business part of a spreader—and all its driving parts, is mounted on the rear axle. This is a patented feature. You cannot get it on any other spreader.

The beater on the axle means there are no clutches to give trouble, less than half the parts heretofore used on the simplest spreader, big drive wheels and a low down spreader without stub axles. Only hip high to the top.

New Revolving Rake

In addition, the John Deere Spreader has a revolving rake that delivers an even amount of manure to the beater. It keeps the beater clear and working free. It works entirely independent of the rest of the spreader and assures uniform spreading. It decreases—not increases—the draft. Another exclusive feature.

Call on nearest John Deere dealer and see the spreader with the beater on the axle. Write for "Farm Manures and Fertilizers," a valuable text book free.

John Deere Motor Press

The Press with the powerful eccentric gears. Gears are mounted off center, giving more power on the working stroke, a quicker return of plunger and very desirable action of the self-feed—the three points of prime importance.

Easily bales 2 to 4 tons per hour without any jar or shock.

Powerful self-feed arm and plunger, improved form of drop blocker and automatic tucker insure well shaped, firmly packed, smooth end bales,—the kind that bring the highest price.

Entire outfit is always ready for work. No lining up of engine required.

Wide track front axles with a fifth wheel is why this press stands up so well and is so easily moved.

Made in three sizes for 14x18, 16x18 and 18x22" bales.

Write if interested in Hay Press, Loader, Stacker, Side Delivery Rake or other hay tools—and ask for free book, "Better Hay—How to Make and Market It".

and to avoid confusion where several men are lighting at one time, a very good practice is to paint the tops of half of the heaters, in the proper arrangement, with a good coat of white which can be easily seen in the dark, or if different types of heaters are used they may be arranged in a similar way; the writer alternates one large heater with two small ones. This practice will also be found useful when the filling gang goes into the orchard. The lighting crew may have gone to bed, but if they report that white or black heaters, as the case may be, have been lighted the filling will be much simplified.

After the heaters are all in place the owner may go out some afternoon and light two or three of them to see how they work. He will probably find them perfect; they will light easily and burn well; but when he tries the same thing at a temperature of 30 degrees he will not find it so simple. Then, unless he has a different sort of heater from any that have come under the notice of the

heaters out of orchards and leaving them unpainted and unrolled in the gutter for the summer must be condemned by all careful orchardists; but it is a practice that is far too common.

OLIVE COOPERATION

By Mark S. Watson

THE success which has crowned the efforts of the orange growers, once they have united, the raisin growers, united, the almond and walnut growers, united, the farmers within a county or group of counties, united, to say nothing of the similar associations in the northwest states, has been so striking that it can not be missed. In some cases success has not been complete, but in every case it has brought to individuals conditions so much better than they would have found without an association that the lesson is reasonably clear.

Only a short time ago it was brought forcibly to the attention of the olive growers who for recent years have been facing conditions far from satis-

Wire Gauge for Indicating Proper Depth of Oil in Heater and Wick of Cotton Waste for Starting

writer, he will find that without wicks which will burn long enough to warm the oil they will be all but useless. A very satisfactory wick for this purpose is made from a piece of cotton waste somewhat larger than a man's fist. This is attached to a piece of wire and hung from the chimney. The proper placing of the waste is very important: enough of it must be in the oil so that it is always saturated but it must never be wholly submerged or it will not burn at all. Renewal of wicks after the first burning each season is not considered necessary as there is usually enough soot clinging to the wire and sides of the heater to do the work.

After the danger season has passed the question arises as to what is to be done with the heaters for the summer. If one is provided with the necessary storage space and cares to go to the expense of handling it is a very good idea to collect the heaters and store them under cover. Where bases, such as were described above, are in use they may be set level under the trees, and the heaters, after emptying and treating with paint or oil against rust, set upon them. If any oil is left a very careful watch must be kept to see that none is spilled or leaks about the tree. Pickers, pruners and all men working in the trees should be instructed to be particularly careful and report at once any overturned or leaky heaters, as oil even in small quantities is very injurious to plant life. The hauling of

factory. There have been sporadic efforts to organize but none have succeeded. Now comes the California Ripe Olive Association with representatives everywhere in the state and headquarters in San Francisco, near the offices of the president, J. J. Avis, himself a grower. At the Palo Alto convention during the annual session of the State Fruit Growers' Association the needs of the olive growers were briefly set forth by some of the leaders and a few days later the Oroville growers also showed their interest by holding an organization meeting.

The olive situation is a curious one, probably the more curious to the man who has seldom been out of California. He is in the habit of seeing ripe olives on almost every restaurant table and in his own home. He eats them with as little special thought as he eats bread.

This man should have taken his stand somewhere in a metropolitan restaurant this year during the heavy tide of travel from the East. He should have seen the average Easterner when the waiter brought ripe olives to the table, the wary way in which the dark skinned fruit was approached, the added suspicion when it proved softer than the green olive, and the deliberation as to the edible possibilities of the "bad olives." The experience would have taught the Californian something of the East's ignorance of one of California's finest products.

The writer talked with one visitor

FIRESTONE TIRES are made for you—for your rush to town on a hot day they were made tough and heat-resisting. For your safety in slippery places there are the strong, gripping Non-Skid letters. whose California uncle, an olive grower, had sent East last Christmas a small keg of his best ripe fruit, packed with most extraordinary care and had made the fatal mistake of referring to the shipment merely as "California olives." The eastern nephew had opened the keg and looked over the supply.

"Didn't you find them wonderfully good?" he was asked.

"I thought they had rotted!" he said mournfully. "I had never seen black olives before, and besides they were not hard like those we eat. I threw the whole keg away. Knowing what I now know I wonder I wasn't struck by a thunderbolt for that deed."

An extraordinary case? Not particularly. The East eats green olives in good quantities, and of course consumes a good deal of olive oil although not nearly as much as it could consume to good advantage. The olives are considered a luxury, an appetizer, and the food value is not guessed by any but a small minority of dietetic experts.

Green olives have been forced on the Eastern public, green olives from Spain and Italy and southern France. Across the Atlantic the olive does not ripen to any such splendid condition as the California fruit, hence the European growers, able to obtain labor for a few cents a day, urge the olive in the best form for them to ship. The European growers are well organized and the jobbers as well.

A pessimist declared the other day that it is too late for California olive growers to organize. "There is an oversupply already" he said. "There must be, or we wouldn't have all this trouble disposing of our fruit at a profit." It would be difficult for anyone to make a statement farther from the fact. The problem is different, far. There are under cultivation today some 1,300,000 acres of olive land. California's olive orchards occupy some 25,000 acres, not all producing.

San Dimas Citrus Nurseries
ESTABLISHED 1900
San Dimas, Cal. U.S.A.

California's capacity is less than two per cent of world capacity, which does not look like pressing the market. But the point is that the other acreage insofar as it concerns the American market is devoted almost exclusively to the green olive, for the excellent reason that the foreign green olive cannot approach competition with the California fruit. Under normal conditions the ripe fruit should be eaten in many times as great quantity as the green.

Here is a demonstration. If one of ten families should eat a California olive a day the country over, every last California olive would be exhausted and a few thousand families would get none toward the end of the year.

Or here's another. A certain popular cigar is said to be sold to the extent of 1,000,000 a week on the Pacific coast. This takes no thought of other cigars at the same price or others at other prices, or cigarets or pipes. It is the report of one cigar brand. Well if olives should be eaten the country over at that rate, every California olive would be gone early in the autumn of each year.

This would indicate that the problem of disposing of California's olives is not a serious one. "It isn't" contends Mr. Avis. "It is simple if the growers will organize. It should not take much of a campaign to convince the East of something that California already knows, that the ripe olive is the best olive. We will have the help of every physician in the country."

"We are standing today just where the other associations stood years ago, and we know from their experience what they did not know for certain, namely that organization will do for agriculture just what it has done for every other industry. We have one great feat to accomplish, the education of the Eastern public, and while that should not be hard for an organization to accomplish it is altogether too expensive for one grower or packer to undertake."

AVOCADO-AHUACATE

Written for California Cultivator
By Edwin C. Hart, President California Ahuacate Association

IN a recent article in the California Cultivator (August 5), discussing the relative merits of the names avocado and ahuacate, letters from Mr. Lake and Mr. Close of the department of agriculture are quoted, as is also that of Mr. Peter Bisset, plant introducer in charge of foreign plant introduction. The position taken by these gentlemen appears to be that where a name has become "thoroughly established," it should not be changed, even though the name so established is not the original name. It is probable that when a name has become thoroughly established it is impossible to change it even though the name is a corruption of the true name or an entire misnomer. A good example of this is the attempt of the United States department of agriculture to popularize the name pomelo. Conceding that pomelo is the correct and more desirable name, it must be admitted there are comparatively few who are not familiar with the fruit under the name of grape fruit.

Therefore, if the name avocado has been generally and thoroughly established, as seems to be assumed by the writers referred to, it would undoubtedly be useless to attempt to rid ourselves of this undesirable term and substitute the correct one. There seems to be, however, no convincing

evidence that that is the case. The fruit in question is known but slightly throughout the United States, and in the cities where it is marketed is not generally referred to under the name of avocado, but under the name alligator pear. Because a small number of growers of this fruit in Florida have seen fit to adopt a name which is not only historically incorrect but actually misleading to the point of absurdity, we do not think that such usage has "thoroughly established" that name, either in pomological literature or elsewhere. In view of this example, one of several that might be quoted, it is well to avoid overestimating the

effect of the adoption up to this time by the United States department of agriculture of the name avocado.

The name ahuacate has been the name of the fruit since the time of Cortez' invasion of Mexico; prior to that time it was called ahuacatl by the Aztecs. Ahuacate is euphonious, easy to pronounce, impresses itself upon the memory, and is historically correct. Ahuacate is undoubtedly the most commonly used name, considering the world as a whole, and the only name used in 75 per cent of the area in which the fruit is produced.

The term alligator pear has some value because of its peculiarity, which

AWARDED GOLD MEDALS San Francisco 1915

ZEROLENE OILS & GREASES RED CROWN GASOLINE

The Exposition jury found Zerolene first in lubricating efficiency; Red Crown, first in carbureting qualities, in purity and uniformity. A victory for Standard products made from California crudes, in competition with other gasolines and automobile oils!

Standard Oil Company
(California)

Quick—Nitrogen

is obtained by using strong, active, virile nitrogen-producing bacteria that come in FARMOGERM to inoculate your cover crop or alfalfa seed. Extensive government experiments reported an average deposit of 122 lbs. of nitrogen per acre by well-inoculated legumes, besides that taken off in the crop, (equivalent to 1000 lbs. of nitrate of soda), and the Experiment Stations in sixteen States testify that FARMOGERM is a most successful inoculation.

The Standard Inoculation

FARMOGERM

High-Bred Nitrogen Gathering Bacteria

is a moist, jelly-like substance, containing billions of nitrogen-gathering bacteria. It is put up in a patent bottle, which keeps the jelly (containing bacteria food) moist at all times.

Bacteria cannot live long in cotton wads, granular media, or in any other dry state. The nitrogen-gathering bacteria live for years in the moist jelly-like media of Farmogerm.

Results Guaranteed

Prices: 1 Acre, \$2.00; 5 Acres, \$6.00; 50 Acres, \$55.00.

LOS ANGELES, CALIFORNIA

arouses curiosity and makes it easily remembered, and because it is English. It already has a stronger hold upon the public of the United States than any other name of the fruit it stands for.

Avocado is used only in parts of the United States, together with alligator pear and ahuate. Avocado is the past participle, of the Spanish verb "avocar," meaning "to call up by a superior from an inferior," generally used in times past by a superior judge taking a case out of an inferior judge's court without the necessity of an appeal. The practice is obsolete now and the word has fallen into disuse. The Century dictionary also gives it as a corruption of the Spanish word "abogado," meaning advocate.

There is small reason to doubt that Southern California can produce a better quality and better crop of ahuate than any other considerable section of the United States. We are today doing more experimenting and planting more trees than any other place in the world. We have a great opportunity to legitimately advertise our product as against our only competitor (Florida) by refusing to allow to be forced upon us the corruption avocado in place of the proper and more generally known name ahuate. So far as our experience has shown we are producing a fruit superior to that of Florida, and by sticking to the name ahuate we can make a distinction between our fruit and that of Florida. The name ahuate will serve as our trade mark; and if we stay by our guns and persist, it will not be long before the name ahuate will mean an unusually good alligator pear, and the name avocado a second class product.

The question of name may not seem important, but it is undoubtedly desirable, if not possible in the early stages of an industry or enterprise, to promulgate the true name rather than the corruption. Languages, however, have a capricious way of their own of adding terms regardless of logic and history, and it may be that neither ahuate nor avocado will find a permanent place in our language, but that the establishment of the name ahuate, used by millions of persons where

the fruit is now grown, in connection with the California product has the advantage of furnishing a good trade name, as well as the correct name, is indisputable.

(Ahuate is easy to pronounce and is pleasing to the ear. It is pronounced a-wa-ka-ta, with the accent on the third syllable, the a's in the first three syllables having the sound of a in arm; the final vowel, the sound of a in say.—Editor.)

AVOCADO-AHUACATE

We recently referred to the terms avocado and ahuate, giving correspondence from different members of the United States department of agriculture in which the term "avocado" was given preference. The state experiment station has issued a bulletin on avocados in which the original term has been used. This has caused Mr. Edwin G. Hart, president of the California Ahuate Association, to reply as may be seen in the preceding columns on this page. This association was formed some months ago in Los Angeles and is officered as follows: President, Edwin G. Hart; 1st vice-president, Wm. A. Spinks; 2nd vice-president, Charles Silent; secretary, D. W. Coolidge; treasurer, C. P. Taft; the executive committee consists of F. O. Popenoe, chairman, C. P. Taft, W. L. Rideout; the directors are C. P. Taft, Orange, Joseph Sexton, Goleta, W. A. Spinks, Monrovia, Edwin G. Hart, San Marino, D. W. Coolidge, Pasadena, W. L. Rideout, Whittier, J. Eliot Coit, Berkeley, Charles Silent, Glendora, F. O. Popenoe, Altadena.

Mr. Hart writes regarding this association:

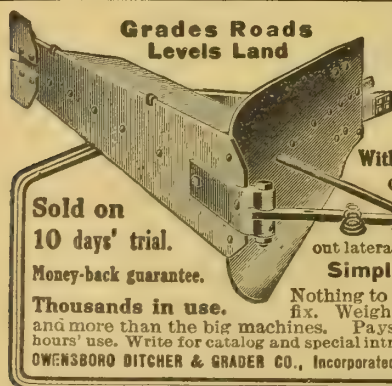

"We expect the association to be of great assistance to all those who are pioneers in the introduction of this new and important industry. Our main work at present will be to furnish our members information that will benefit them in their efforts and to educate the public as to the merits of the ahuate as fast as possible. As an association we are in position to get valuable help both from the state agricultural department and the department at Washington. The membership fee is five dollars."

CALIFORNIA WALNUT PROSPECTS

CIRCULAR is being mailed to the trade by the California Walnut Growers' Association which contains so much valuable information regarding crop and marketing conditions that we quote largely from it:

We have not put out a trade circular sooner this year owing to the fact that up to this time crop prospects have been constantly changing. The original setting of walnuts was the heaviest ever known. The walnut blight, which attacks the growing walnuts generally most severely in May and June and which ruins 90 per cent of all nuts infected, did not develop as early as usual this year but has worked later. The blight has been extremely severe, in some districts ruining over 40 per cent of the crop. The damage to the total California crop is estimated at 22 per cent. We still believe, however, that the shipments for 1915 will be at least as heavy as they were on the last year of good production, 1912, when 12,500 tons left the state. In fact our estimate now is for 13,200 tons. The blight has had no effect on the walnuts which will be shipped under the Diamond Brand as nuts which have been blighted are ruined for commercial shipments and those which are not blighted are in no way affected by this bacteria. Therefore unless an unusually hot spell is encountered between now and harvest time the quality of the shipments will be fully equal to those of last season. We have noticed printed reports in some of the trade journals which undoubtedly originated from sources not well posted or where the contributor was estimating the crop in some particular section only, which might give the impression that the crop is double that of last season. Some of these reports are undoubtedly true as far as certain definite sections of the walnut district are concerned, as some districts will possibly develop double last year's light production, but the California walnut producing district is 175 miles long and we believe the estimates above given will be closely borne out by actual shipment figures. For the last two seasons our final estimates made just prior to naming prices have been within five per cent of actual production, and in both years our estimates were higher than actual deliveries.

Improvements

The California Walnut Growers' Association has spent this year \$12,000 in an effort to improve the quality of Diamond Brand walnuts. At a cost of \$8,000 cash we have secured the license to use a patented method of bleaching walnuts eliminating entirely the use of sulphur. Hereafter no sulphur fumes will be used in bleaching Diamond Brand walnuts. It has been generally conceded that sulphured walnuts become rancid and deteriorate more quickly than unsulphured goods. We want our product to give satisfaction after it is delivered and in the hands of the consumer. We are this year purchasing at a cost of \$4,000 a new set of graders for every one of our twenty packing houses. The screens used in segre-

ating the No. 2's from the No. 1's this year will be made of galvanized iron punched with a steel die, openings slightly larger than the size of the openings heretofore used. We believe that Diamond Brand walnuts will be the only ones graded over a larger opening this season. Obviously this will increase the minimum size of the No. 1 walnuts by allowing the smaller ones to go into the No. 2 grade and will make the maximum size of the No. 2's larger for the same reason, thus improving the appearance of both grades. The crop will develop a larger percentage of No. 2's this year than last year. This will tend of course to decrease the output of No. 1's and increase the output of No. 2's. Thorough sampling tests we have just made in all districts indicate that the crop will average 12 per cent No. 2's against only six per cent last year. Fortunately as the best posted Eastern trade have satisfied themselves that it will be impossible to secure new crop foreign walnuts in time for distribution for the holiday trade, and realizing the necessity of having a supply of cheaper walnuts of good quality for the less particular trade, think our No. 2's will fill this requirement, and increased bookings have recently been coming in freely on this grade.

French Crop Prospects

We have just received the first definite cablegrams from our European agent giving a brief outline of the foreign situation, after making a tour through the Grenoble and Bordeaux districts of France. His advice is that French crops promise good normal yields; that few future sales have as yet been made but these have been at higher prices than last year and for local consumption; that practically no foreign contracts have been entered into; that exportation will be exceedingly difficult and delayed; labor for picking and curing scarce, and that it appears improbable that importations in any preceptible quantity will reach America even for the Christmas trade. As soon as we receive full reports by mail on the foreign situation additional information will be passed to you.

Additional Acreage

The California Walnut Growers' Association this season will ship a larger per cent of the California walnut crop than ever before, having secured much new membership in the old local associations and also the exclusive marketing of the output of the Moorpark Walnut Growers' Association and the Simi Valley Walnut Growers' Association, both located in Ventura County, there being approximately 1500 acres of walnuts in each of the above named associations. The Bishop and the Stow ranches at Santa Barbara, whose outputs have heretofore been marketed through the Johnson Fruit Company of Santa Barbara, have also become members of this association and we will handle their output. The Hemet Walnut Growers' Association of Hemet has also affiliated with us exclusively. There are about 800 acres in this association.

Maturity and Prices

The crop promises to mature about

as early as last season. This will enable us to give every customer his delivery in ample time for distribution for the Thanksgiving trade. Association prices will doubtless be announced towards the last of September and owing to the crop's large volume will undoubtedly be lower than have prevailed in the last two seasons. We hope our figures will be attractive enough to move the entire crop promptly without a carry over. If we can develop such a condition there will doubtless be more than the usual profit in walnuts for every handler and a necessarily larger volume of business must be expected.

STANDARD FOR PACKING AND MARKETING APPLES

The last legislature appropriated \$5,000 for the payment of the cost of printing, traveling and other expenses, together with salaries, of inspectors who shall be appointed by the state commission of horticulture to enforce

California, in any container upon which or the label of which the word 'Standard' is used as the brand or label or any part thereof, or as qualifying the pack, container, or the contents of the container, and to such container.

"Sec. 3. No apples shall be packed, shipped, delivered for shipment, offered for sale or sold, in the state of California, in any container upon which or the label of which the word 'Standard' is used as the brand or label or any part thereof, or as qualifying the pack; container or the contents of the container, unless such apples and such container shall comply with all of the requirements of this act.

"Sec. 4. The following standards for apple boxes and for the packing, labeling and branding of apple boxes to which this act is made applicable, are hereby established:

"(a) The standard container shall be a box of the following dimensions inside measurements, when measured

side of one or both ends thereof, in plain words or figures, and in the English language, the following statement. The number of apples in the box; the style of pack used; the variety of the apples contained, unless the variety be unknown to the packer, in which case the variety shall be stated as 'unknown;' the name and business address of the person, firm, company, organization, or corporation, who first packed, or caused the same to be packed, and, if re-packed, the name and address of the person, firm, company, organization, or corporation re-packed, or caused the same to be re-packed; the name of the locality where said apples were grown; the date when such apples were first packed; if the apples have been re-packed, the date of re-packing; and the stamp hereinafter provided for, canceled as required by the state commissioner of horticulture of California. A variation of three apples more, or less, than the number stated, shall be allowed.

"(d) The apples contained within each box shall be well grown specimens of one variety, hand picked, well colored for the variety, reasonably uniform in size, properly matured, well packed, and practically free from dirt; and shall be free from insect pests, diseases, rot, insect bites, bruises and other defects, except such bruises and defects as are necessarily caused in the operation of packing; provided, however, that a variation from the standard as to insect pests, diseases, rot, insect bites, bruises, and other defects, shall be allowed, not to exceed ten per cent total such defects, nor to exceed three per cent of any one such defect.

"Sec. 5. The state commissioner of horticulture of California shall be charged with the enforcement of the provisions of this act, and for that purpose shall have power:

"(a) To enter and to inspect every place within the state of California where apples are packed, shipped, delivered for shipment, offered for sale

SOME GROWTH OF PEACH TREE

The above shows a peach tree of the "Red Bird" variety planted in January, 1914. The bud was one year old at that time and it was headed back to 28 inches. The photograph was taken in July of this year, at which time the second summer's growth was perhaps half made. The circumference of the trunk at the time of photographing, 15 inches from the ground,

was nine and a half inches and its height 14 feet. The branches have a spread of 15½ feet and the yield of fruit was two-thirds of a bushel, 95 per cent of which was extra fancy stock. The size of the fruit was very uniform, running about eight and three-fourths inches in circumference. The tree was grown on the place of Mr. A. D. Nichols, Riverside, and the photograph was made by Mr. Avery E. Field, also of Riverside.

without distention of its parts: "Depth of end, 10½ inches; width of end 11½ inches; length of box, 18 inches; and having a cubical content of as nearly as possible, 2,173½ cubic inches; provided, that a smaller box may be used if plainly marked on one side and on the labeled or branded end with the words 'short box.'

"(b) No statement, design, or device, appearing upon any box within which apples are contained, or upon the brand, or lining thereof, or upon the wrapping of any apple, or upon any sign, or placard used in connection therewith, and having reference to or regarding the box or the apples contained therein, shall be false or misleading in any particular.

"(c) Every box, within which apples are contained, shall bear upon the out-

the standard apple act of 1915. This bill was passed by the legislature and approved by the governor on June 10, 1915. The attorney general has ruled that this law applies only to interstate shipments. It is:

"An act to establish a standard for the packing and marketing of apples, fixing penalties for the violation of its provisions, and providing for its enforcement and making an appropriation to carry into effect the provisions, which are:

"Section 1. This act shall be known, and for any and all purposes may be referred to, as 'The standard apple act of 1915.'

"Sec. 2. The provisions of this act shall be applicable to all apples packed, shipped, delivered for shipment, offered for sale or sold in the state of

Maiers' Dry Walnut Huller

This machine has no equal; it is the greatest labor-saving machine ever invented. One man can run the machine and do the work of ten men. Interesting literature and prices sent on application. It is the quickest and most economical way of hulling walnuts.

The Lawn and Flower Garden

OLD GARDEN LORE

Written for the California Cultivator
 By Ernest Branton

OLD garden literature has always held a peculiar charm for me and I never lose a chance to secure old books, pamphlets, etc., of this class, even reprints are almost sacred if the subject matter dates back some centuries.

In reprints from Gerarde's quaint old Herbal of 1597 may be found some very curious descriptions and lists of uses of plants then new and rare, but now common everywhere. Of our Indian corn, then known as Turkey wheat, he says:

"Turkey wheate doth nourish far less than either wheate, rie, barley or

Chrysanthemum Care

The care to be given chrysanthemums at this time is considerable if one is to have fine flowers. No more cultivation should be given. The ground should be ridged or basined so that water will be certain to reach plant roots in liberal volume or failure of flower crop will result. It is hardly possible to give the plants too much water from now on until flowers are picked, and one may safely water at any time of day or night. Do not be afraid to sprinkle the whole plant even on the hottest day. If possible mulch all plants with stable manure; it matters little how much one uses if fresh manure is not put against the stem of the plant. A heavy supply of plant food is needed until the first bud shows

In the Tropics.

otes. The bread which is made thereof is meanly white; it is hard and dry as bisket is, and hath in it no clamminus at all, and for which cause it is of hard digestion, and yieldeth to the body little or no nourishment. We have as yet no certaine proore or experience concerning the virtues of this kind of corn, although the barbarous Indians which know no better, are constrained to make a virtue of necessitie, and think it a good foode; whereas we may easily judge that it nourisheth but little, and is of hard and evil digestion, a more convenient foode for swine than for men."

Of garden radishes he says: "Radish are eaten raw with bread instead of other foode; but being eaten after that manner, they yield very little nourishment, and that faultie and ill. But for the most part, they are used as a sawce with meats to procure appetite, and in that sort they engender blood less faultie, than eaten alone or with bread onely; but seeing they are of harder digestion, they are also many times troublesome to the stomacke; nevertheless, they serve to distribute and disperse the nourishment, especially taken after meate, and taken before meate, they cause belching, and overthrow the stomacke."

color, when all feeding should cease. Keep plants well staked and tied, also thoroughly disbudded and clear of side growths and crown suckers.

A Dark Rose Needed

While rose hybridizers are devoting so much time to the production of new tints in roses it may be well to remind them that California needs a good dark rose of the Black Prince or Camille de Rohan type. Both of those named are unsatisfactory over a large part of this state, though we have none better than these two old-timers. It is high time we had some new ones that will thrive in the exacting climate (for roses) of the southern end of the state.

Compost Heaps

In cities the gardener too seldom has room for a compost heap for one must remain in place for a whole year after the last material is added before it is fit to use and it will be available then only when it has been thoroughly wetted at frequent intervals. In rural districts more space is generally available and compost heaps may be kept out of the garden proper. For the best soil for ferns, begonias and many other plants we must either insure the decay of quantities of vegetable matter or hike to the foothills and canyons for

leaf-mold. Good ferns may not be permanently had except such material is to some extent mixed with the soil.

The Least Resistance

Very often I see garden owners year after year hanging on to some plant that will never thrive with them. Why work so hard against natural forces? So much misplaced care is given rose bushes of weakly habit or constantly attacked by mildew. If you find some sorts are so subject to this fungus that fine blossoms cannot be grown, throw all such bushes away and get others. The fact that you have rose bushes free from mildew proves there are others also free. If all in a varied collection are attacked it clearly indicates that the care-taker is at least partly to blame or, as our legal friends say: guilty of contributory negligence. When fighting mildew use preventive rather than curative measures. The ounce of prevention rule most heavily applies to war against mildew.

A Shade Flower

Wish't somebody would go into a shaded, watered canyon, pick some seeds from ripened heads of what looks like a clear yellow sunflower with light-green foliage and then plant these seeds when rains come, on a very shady side of the house. The plant belongs to the sunflower family yet will not grow in the sun, therefore is

a shade flower. Let us call it by this name for it has no popular name in local circles and botanists know it as *Venegasia carpesioides*. I first saw it well up in Laurel Canyon, Hollywood; next in Griffith Park. It is not common anywhere and is not a coarse plant or flower but one of delicate beauty when compared with the common wild sunflower.

The Best Rose

In the midst of many claimants what shall we say when asked what is the one best rose for the southern end of California? It will not do to name a new and untried one; neither one that is strong only when budded upon a more vigorous stock. What is desired is the name of a rose that with average care, in average soil, will produce a full crop of good blossoms over a fairly long season and that may be grown upon its own roots by all who wish to raise them from cuttings. Such a rose is Kaiserin Augusta Victoria and the writer knows of none superior to it in the essential points herein outlined. Who has a better one to champion?

Digging Gladiolus

Several have asked me of late when comes the proper time to dig bulbs of gladioli. When the tops begin to turn brown on the edges the bulb is ripe; no need to wait for it to die. Cut top off three inches above bulb, store latter in dry, cool place until at least January, that being one of the best months for planting.

ON THE MARINA AT THE EXPOSITION JUST BEFORE THE ASCENT OF THE AVIATOR

THIS WEEK AT THE EXPOSITION

TOMORROW, Friday, is Southern California Counties' Day. Saturday is California High School Day. The Single Taxers are just ending their convention, and this is also Lawyers' Week.

The California State Veterinary Association meets on August 30 and holds sessions until September 3.

The principal event in connection with the exposition this week is the meeting of the Society for Horticultural Science. It is to be held at the University of California, across the bay, but of course the exposition is one of the principal "exhibits" which will be used by this great society.

The sessions will be held at 9:30 a. m., 1:30 p. m. and at 8 p. m., in a hall to be designated later, in the agricultural department of the University, to which the general public is cordially invited. Side trips will be made to the fruit and vegetable growing sections of Santa Clara, Alameda, Contra Costa and Marin Counties. Arrangements for these trips will be made after the convention starts.

The American Pomological Society convenes in Berkeley September 1, 2 and 3. The Eastern delegates to this convention are in California at this writing, observing orchard practices and packing methods in Southern California.

The Eucalyptus Hardwood Association holds its meeting September 8.

Perhaps most important of all the congresses, from the standpoint of arid America at least, is the International Irrigation Congress which will hold several sessions in California: at Stockton September 13, 14; Fresno, 15, 16; Sacramento, 17, 18; San Francisco, September 20.

SIGNS OF THE NEW AGRICULTURAL ERA

By Leonard Carpenter

The farmer's business is the last great industry to feel the real effects of the era which started with the invention of the steam engine, but if the exhibits which have been made at the Panama-Pacific International Exposition are taken as an indication the revolution of methods within the next few years is going to be tremendous.

A few minutes' stroll through the seven and a half acres of the Palace of Agriculture will do more to open the eyes of people generally, and farmers especially, to the possibilities of power on the farm than any other method.

There is very little about the exposition, now being visited by tens of thousands every day, at San Francisco of an historical value, for it has been the intent of the directors to make the showings as nearly contemporaneous as possible. There are however some exceptions to the rule, and one of them is to be found in the Massachusetts space where is shown the plow with which Daniel Webster was wont to turn the soil on his father's farm near Marshfield. The Websters have discarded the dog-fish skin which was usually stretched tightly over the mould-board of the plow and have substituted iron strips. Except for these strips the plow is entirely made of wood. With a coat of paint, however, it might readily pass for a plow of twenty years ago instead of one more than a hundred years old.

Between the Webster plow and the steel plow of today there is not a great deal of difference. Between the oxen which he used and the horses which the modern farmer used there is even less difference. Any tool has been good enough for the farmer and while year after year has found the less efficient machines in most branches of

POTATO CERTIFICATION

AS THERE is so much interest in the movement for certified potatoes we quote Assembly Bill No. 1573 which was enacted by the last session of the state legislature. It is entitled:

"An act to establish a standard for California certified seed potatoes and to prevent the sale of other potatoes as California certified seed potatoes, making the violation of this act a misdemeanor and fixing a penalty therefor."

Section 1. No potatoes shall be sold in the state of California as California certified seed potatoes except those which have been inspected and certified to in accordance with the following requirements:

(a) The growing potato crop shall be inspected by an inspector who shall be appointed in accordance with the provisions of section three once during the blooming period of the plants and again as the plants begin to mature, but before 40 per cent of the plants are dead. A third inspection shall be made after the crop has been harvested and graded.

(b) Potato fields showing a mixture of more than 250 hills per acre with any other variety or varieties, or showing more than 500 weak hills, or more than 50 hills affected with black-leg (*Bacillus phytophthorus* Appel) shall be disqualified for certification, unless such mixed and weak or diseased hills shall be removed from the fields at this time under the supervision of the inspector.

(c) At the time of the second inspection the inspector shall dig, or cause to be dug under his supervision, and weigh at least 100 hills per acre, and if five per cent of the hills so dug shall each weigh less than 30 per cent of the weight of an average hill, the crop shall be disqualified for certification.

(d) After the crop has been graded it shall be inspected and shall meet the following requirements:

The selected potatoes after being graded shall be free from any infestation of eelworms (*Heterodera radiciola*), larva of tuber moth (*Phthorimoea operculella* Zeller), or infection of wart disease (*synchytrium endobioticum* Perc.) or powdery scab (*Spongospora solani* Brunch.), and shall be practically free from net necrosis or infection of late blight (*Phytophthora infestans* De By.). They shall be in the judgment of the inspector free from serious infection of scab (*Oospora scabies* Thax.) or Rhizoctonia, with not over five per cent light infection of scab (*Oospora scabies* Thax.) or ten per cent light infection of Rhizoctonia. They shall not contain more than eight per cent light infection of wilt diseases (*Fusarium oxysporum* or *Verticillium albo-atrum* Reink. and Berth.), and not over two per cent of deep infection of wilt (*Fusarium oxysporum* or *Verticillium albo-atrum* Reink. and Berth.) They shall also be free from any mixture of colors or distinct types, and shall be reasonably sound and free from cuts or bruises or second growth, and shall conform in shape to the

varietal type. Not over five per cent of the tubers shall weigh less than one and three-fourths ounces and not over five per cent shall weigh more than twelve ounces.

Sec. 2. The owner of potatoes which meet the requirements as stated in section one of this act shall be given by the inspector at the time of making the last inspection a certificate stating that such potatoes have been inspected by him in accordance with the provisions of this act and that they meet all the requirements as California certified seed potatoes. All potatoes sold as California certified seed potatoes shall bear on the package or container the certificate of inspection, which shall state the net weight of contents at time of packing, the date of inspection, and the date of packing. The inspector shall determine the weight of the potatoes which have passed inspection and are eligible for certification and shall only issue to the grower sufficient certificates to label this amount of seed.

Sec. 3. The matter of inspection shall be in charge of the state commissioner of horticulture, and the cost of inspection shall be borne by the grower of the potatoes inspected.

Sec. 4. Any one who shall violate any of the provisions of this act shall upon conviction be deemed guilty of a misdemeanor, and shall be punished as provided in section 19 of the Penal Code.

POTATO CONVENTIONS

Regarding the troubles which are now confronting the potato grower and the necessity of securing better seed Commissioner Cook writes:

"I learned a year ago or more that potatoes were very rapidly declining in yield and quality, that the cause was mainly fungoid diseases, and that with proper care and education the difficulties could be met. This is the reason we are taking so much pains to educate the people. This is why we are to hold the potato conventions at Bakersfield, Tuesday, September 14; El Monte, Los Angeles County, September 16; Perris, Riverside County, September 17; Salinas, Monterey County, September 20; Stockton, San Joaquin County, September 23.

"We hope to make it possible to secure sound seed in our own state at no distant day. This will secure two valuable assets: better yield and non-poisoning of the soil which results from planting diseased seed. This poisoning lasts for a number of years, possibly six or eight, so you see it is a matter of great importance.

"The law is not mandatory. People can act or not as they desire, but they cannot label their potatoes "certified seed" except they comply with the law, in which case the growing of the seed and the seed itself after digging will be thoroughly inspected by competent men. This has been the rule for some time in Maine, Michigan, Wisconsin, etc., and they have found that it has served them excellently well. We must fall into line."

One may love the friend whose faults he points out, but there are several more effective ways to prove it.

POTATO CAMPAIGN

The decline of the yield of potatoes to one-fifth that of five years ago in most of the potato growing sections of California is both startling and alarming. The cause is well known by the few. It is fungous attack. Methods to destroy these fungi are known. Disease-free seed is scarce and difficult to procure. Certified seed, known to be sound, brings from two to five times that which has not been inspected and so is very likely infected with disease germs. It follows that education regarding these handicaps to successful potato production is a vital need of our potato growers. This has led to the following schedule of potato meetings in September: Bakersfield, Kern County, September 14; El Monte, Los Angeles County, September 16; Perris, Riverside County, September 17; Salinas, Monterey County, September 20; and Stockton, San Joaquin County (meeting of the West Coast Potato Association) Thursday, September 23. Education along these lines means thousands of dollars to our state and to the potato growers.

W. N. Shear, of the United States department of agriculture, and A. J. Cook, state commissioner of horticulture, will address each of these meetings. Full discussion by the growers present will be a valuable feature of each conference. Any effort to secure large attendance of those interested at these meetings by growers, county commissioners, and by the press will be greatly appreciated.

KEEP UP THE PRESSURE

"Often one hears the argument that heat causes expansion of the air in a tire sufficient to produce a blow-out," says P. W. Litchfield, factory manager, The Goodyear Tire & Rubber Co. "Many motorists thus excuse their habit of running tires under-inflated. Even experienced garage men advise that tires be run at 15 to 20 pounds lower pressure in hot weather. We have to admit, of course, that heat does expand air and raises the pressure in a tire, but in its practical effect the rise in temperature is insufficient to cause even the slightest danger.

"To satisfy ourselves on this point we recently made an unusually severe test, using a runabout equipped with 33x4 tires. We selected a day, which according to the local records was the hottest June day ever recorded. The tires were pumped up to 80 pounds with the car standing in the cool of the garage. It was driven intermittently for about an hour, and when not running was allowed to stand in the sun. Then it was taken for a spin at 40 miles an hour over brick and tarred wood-block pavements. On measuring the pressure we found it had increased just four pounds.

"As far as the welfare of the tire is concerned a difference of four pounds is really no difference at all. Tires are now built with such a high factor of safety that an increase in pressure of many times four pounds would not cause a blowout unless already ruined by overloading and under-inflation. We have often inflated up to 300 pounds without any damage to the tire.

"The most serious variation in tire pressure is caused by leakage. Rubber is to a small degree porous and will allow air under pressure to leak through it. A certain amount of leakage through both tube and valve is normal and to be expected. Your pressure may maintain itself for a considerable time, but it is never safe to

count on it. You cannot put it too strong that under-inflation, not over-inflation, is the condition to guard against."

WHAT GOOD THINKING CAN DO

Every day are the brain-proud American farmers being taught simple, homely, and mighty forcible lessons in farming by the farm peasantry of Europe. Wisconsin holds a lot of such experience. The old New England, New York, and Ohio farmers, who first took up these new fine Wisconsin lands, proved most reckless forgetters of the simple truths of soil preservation. They farmed these lands to grain for 30 to 40 years, until they would no longer return a profit; then they sold them to a German or Scandinavian farm peasant who knew but little out of the book but had been well schooled back in the fatherland to wise handling of the soil. It took only a few years to show a wonderful change in the productivity of these soils. Today, under the influence of live stock farming in the form of dairying, these old lands range in value from \$150 to \$250 per acre. The real science of the thing was worked out by the intelligent owners and managers of the big estates on which the European farm peasants learned the lessons of wise farm practice.

H. W. Collingwood, the able editor of the Rural New Yorker, is writing a series of readable articles for The Country Life. It is good to read the experience and well grounded conclusions of this great student of the soil. Here is an extract which tells the story of many a noble old farm in the east and middle west:

"Down in Delaware I had seen an old, wasted, slave plantation come back to fertility. Most of us have let the historians do all the thinking and reasoning for us so that we have come to believe that in New England and the Middle West are the sections which show the real miracles of history. As a matter of fact, the sands of the Delaware peninsula have their marvels to relate. I have heard of an old mansion, the pride of a great estate from the earliest Calverts through generations of proud slave holders until the war left it with one shattered soldier and his frail daughter. With the scattering of slave labor this farm went back to a sand heap and became a loafer farm of scrub oak and melancholy pines. The last lady of this long line of aristocracy died, and this proud estate is said to have passed to a colony of poor Russian Jews, who are bringing the farm back with crimson clover, cowpeas, and lime, until it is more productive than ever before.

"It is one of the wonders of this land of freedom that human society can turn such somersaults and land upon its feet. The poor Jew, crushed down by generations of oppression, steps into the place of the proud master and does so because he is able to force the abandoned land into the task of making itself over. There is no stronger method by which a race or broken down family can redeem itself more thoroughly than by fighting the battle which saves a farm and brings it back into productive life."

ANOTHER ON US

An Easterner who had bought a farm in California had heard of his neighbor's talent for raising large potatoes, so sent his farm hand over to get a hundred pounds. "You go back home," answered the talented farmer to the messenger, "and tell your boss that I won't cut a potato for anyone!"—Everybody's Magazine.

TAKE CARE OF FARM TOOLS

Entirely too many people take no care of farm tools and farm implements. The waste from this source amounts to thousands of dollars every year. The self binder or header remains in the harvest field where it was last used; the cultivator is put in the corner of the corn or kafir field; the drill, the hay rake, and the harrow with many other pieces of farm machinery are drawn up against the barnyard fence at the close of the season and left there exposed to the weather all winter and spring until needed for the next crop.

The annual depreciation of farm machinery should not exceed ten per cent, but on many farms it often amounts to 50 per cent or more. Every farmer can save hundreds of dollars by having a good machinery shed in which all tools and implements can be stored when not in use.

Wagons and buggies when not in use always should be placed under shelter. Planters, cultivators, plows, harvesters and all machinery when left in the fields at the close of every day's work should be covered with a water-proof tarpaulin or covering that will protect the machinery from wind, dust, rain and other deteriorating influences. At the close of the season the machinery should be well oiled and put into thorough repair for the next year's crop, and then placed in

the machinery shed. The life of the wood work of the machinery will be prolonged greatly if given at least one good coat of paint every year. Plow shares, mold boards, cultivator shovels, sickles and sickle bars and the like should be given a good coating of axle grease or neat's foot oil.

A good piano often lasts a lifetime because of the excellent care we take of such an instrument. If we were to leave it out in the rain and weather in the back yard it would be ruined in a short time and the neighbors would think that the owner was a fit subject for the insane asylum. Yet that is exactly what most farmers do with some of their most expensive machinery. Give the farm tools and farm implements the same care that is given the piano and they will last a lifetime.—Oklahoma Farmer.

CALIFORNIA

California, Its Resources and Possibilities, or the annual report of the California Development Board for the year 1914, is just from the press and is being mailed to all who may request it. We doubt not if a letter is written to the office of the board at the Ferry Building, San Francisco, the booklet will be mailed to Eastern people who may be looking for information as to California opportunities. There are many tables as to productions of the state and an excellent map showing counties, railway and steamship lines.

SHIFTLESSNESS ON THE AMERICAN FARM

Foreigners cannot understand our methods of haphazard farming. The foreigner that comes here and goes to farming practices no such prodigal methods as we natives do. He keeps his farm as clean as a kitchen floor and husbands what he owns as though it were of his own blood.

The average American farmer is too apt to defer painting his outbuildings when they require it, or to keep them in repair. As a result old ramshackle buildings, fit only as fire traps and breeding places for rats and vermin, grace many of our farms. To let an old barn or other outbuilding stand decaying until it falls from its own weight is a crime. It teaches growing generations to be slothful and at the same time valuable ground space that might be put to profitable use is permitted to go to waste.—Farm Engineering.

ARE YOU ONE?

The requirements of a good farmer are at least four:

The ability to make a full and comfortable living from the land.

To rear a family carefully and well.

To be of good service to the community.

To leave the farm more productive than it was when he took it.—L. H. Bailey.

"Every Day is Bargain Day" to the Man who Buys BUILDING MATERIAL from WHITING MEAD'S Big CATALOG! 1915 Edition is FREE to you—Saves 20% to 40%

\$15 to \$18 Front Doors \$10 Veneered Oak with Plate Glass

—A typical value from our Sash and Door Dept., finest quality veneered oak doors with plate glass panels at top. Secured by special purchases recently and not mentioned in our catalog. All standard sizes and styles. Write for further details.

Screen Doors 25% Off

—New screen doors, the overstock of a famous door factory, made of best selected sugar pine in standard stock sizes. These doors can be duplicated in any first class yard at 25% to 40% more.

Style No. 8, \$1.25

—This door usually sells for \$1.65. Made of clear sugar pine and fitted with black screen wire, like picture, at our price. \$1.25

Style No. 9, \$1.40

—Made of sugar pine, with three lower panels and fitted with galvanized screen wire. A door that will stand lots of use; our price. \$1.40

Odd Doors \$1 and \$1.25

—Inside doors of best sugar pine, 5 panel Colonial and 5 panel O. G., styles a big lot of them, in all sizes.

Oregon Pine \$10 to \$15

—Good new rough Oregon Pine lumber, all sizes, at \$10 to \$15 per thousand.

—Oregon Pine lath, 4 ft., new, \$2.50 per thousand.

—Best grade Slashed Grain Oregon Pine, sanded finish, \$37.50 per thousand. This makes a beautiful interior finish.

—These prices will give you an idea of how our lumber department can save you money. Send in your lists and let us give you our price delivered.

Paints \$1.50 Gal.

—You can buy paints cheaper from us than any other dealer in the West. We buy in large quantities at special prices.

—Standard House and Floor Paints, \$1.50 per gal.

—Standard makes of varnishes at 25% off regular prices.

—Everything in Paints, Wall Tints, Brushes, etc., at big savings to you.

Dutch Kalsomine 4 1/2 c per lb.

Black Graphite Roof 50c

Standard Roof Paints—red, green, gray—per gal. 85c

Shingle Stain, made from pure ground colors 50c

"Standard" Roofing Paper

—A splendid quality of roofing paper that most firms would sell 20 to 40 per cent higher. Each roll complete with necessary cement, nails, etc., ready to lay.

1-ply, double-sanded, per roll of 108 square feet. \$1.15

2-ply, double-sanded, per roll of 108 square feet. \$1.40

3-ply, double-sanded, per roll of 108 square feet. \$1.65

1-ply, "King" smooth, per roll of 108 square feet. \$1.25

2-ply, "King" smooth, per roll of 108 square feet. \$1.50

3-ply, "King" smooth, per roll of 108 square feet. \$1.75

—Send for free sample. Remember we ship direct to you.

SHOVELS!—At Wholesale Cost—SHOVELS!

—You may go a life time before you get such an opportunity again. These shovels are in A-1 order but have been slightly smoked by means of a fire while in transit.

—Every one in perfect working condition, all styles and sizes; note the prices:

Long Handle, Round Point Shovels, per doz. \$4.85 or 50c each

Long Handle, Square Point Shovels, per doz. \$4.85 or 50c each

D Handle, Round Point Shovels, per doz. \$4.15 or 50c each

D Handle, Square Point Shovels, per doz. \$4.15 or 50c each

Long Handle Spades, per dozen. \$3.75 or 40c each

D Handle Spades, per dozen. \$3.75 or 40c each

Long Handle Scoops, per dozen. \$3.75 or 40c each

D Handle Scoops, per dozen. \$3.50 or 40c each

Dana Freezers at Half

—A big lot of Dana freezers. Send in your order today. We've sold hundreds of them at these prices and have yet to hear a single complaint.

3-quart size, regular \$2.50, now \$1.00

4-quart size, regular \$2.50, now \$1.25

\$30 Wallboard for \$19

—The highest grade wallboard on the market; made of 3 layers of moisture-proof fibre, with asphaltum between each layer; or cream white fiber board.

—Cheaper and neater than plaster or lumber, and anyone can install it in one-quarter of the time. Per 1000 square feet. \$19.00

This Special Steel Enamelled Bath Tub \$8

—One of the greatest bargains we ever offered! Made of best galvanized 24 gauge steel.

Outside is finished in a rich sky blue enamel with bronze trimmings and hardwood edge. Priced only \$8.

—Other larger sizes at \$8.50, \$9 and \$10.

Low Down Enamel Steel Toilet Combination. \$11.50

Complete to floor—wonderful value.

Low Down Vitreous China Closet Combination. \$15.50

Special value—worth \$22.50.

Big value in High Tank Toilet Combinations. \$10.00

Complete to floor—a bargain.

Special Bankrupt Stock of Kitchen Sinks.

All sizes—up from. \$1.00

Best Quality Porcelain Lavatories; every one guaranteed—\$10 down to. \$3.75

—\$10 down to. \$3.75

—\$10 down to. \$3.75

geles, California, as Second-Class Matter.**Thursday, August 26, 1915****OUR ADVERTISERS RELIABLE**We guarantee our subscribers against
loss through dishonesty of any adver-
tiser in the Cultivator. We do not at-
tempt, however, to adjust trifling differ-
ences between subscribers and honest,
responsible advertisers, nor will we pay
the debts of honest bankrupts. Notice
of complaint must be sent us within 30
days from date of the transaction, and
the subscriber must have mentioned the
Cultivator when writing the advertiser.**OLD FIRM RETIRES**

For a third of a century farm-
ers of Southern California have pur-
chased farm implements and vehicles
of Hawley-King & Company of Los
Angeles, a firm which has handled
reliable goods and dealt absolutely on
the square with its patrons. Mr. F.
W. King, who has been at the head of
the concern for years, has decided to
retire and close up this large business.
We doubt not there will be many a
farmer in California who will regret
to see this old-time firm terminate its
business-career.

HONOR DUE

In placing a caption over the
beautiful road scene on the cover of
the Cultivator of August 12 we spoke
of it as one of Los Angeles County's
good roads. This was an error. We
should have said that it was a view
of the famous Magnolia Drive between
Riverside and Corona in Riverside
County. We hope soon to give other
scenes showing more of Riverside
County's good roads.

VETERINARIANS

The New York state veterinary
college is sending out its report filled
with information as to the pathologi-
cal side of the live stock industry.
New York maintains a state veterinary
college in connection with Cornell
University. This report is too volu-
minous to even make reference to the
various features of work carried on
in New York state, but we may be per-
mitted to refer to the fact that the
recent outbreak of foot and mouth
disease in this country has shown the
necessity for a more exact knowledge
of animal diseases. Gasoline will not
displace the animal industry of the

United States; it will increase as the
country grows. May we have more of
such institutions as that of Cornell,
and that connected with our own state
university or rather may we have more
and better men graduate from them.

PROCEEDINGS OF CONVENTION

We referred last week to the val-
uable report of the State Fruit Grow-
ers' Convention which we have in this
office for any of our subscribers who
may wish to call for it. Since then
we have received request for copies to
be mailed. The mailing is not done
from this office, the copies which we
have being only for those who call
for them. Those who wish to receive
copies through the mail should send
request directly to A. J. Cook, state
horticultural commissioner, Sacra-
mento.

ONE EFFECT OF THE WAR

Great steel works, ammunition
and auto truck factories of various
Eastern states have received a won-
derful amount of business and profit
because of the war in Europe. Most
of the rest of us, unless it be the
wheat growers, are receiving quite the
reverse. As one indication we may
mention that the exports of American
agricultural implements during the
fiscal year ending July 1, 1915, totaled
about \$10,000,000, while those of the
year preceding were \$40,600,000. It
will probably be many years before
the \$40,000,000 exports of agricultural
implements will be reached again, for
should the war end today, the recon-
struction period will occupy months
and years, and during that time the
money to pay for American agricul-
tural implements will be limited. To
show that this is almost entirely the
result of the war we may state that
European Russia during the past year
imported \$83,000 worth of farm im-
plements; the preceding year she im-
ported \$6,438,000 worth. France did
better; she received during the last
year \$1,153,000 worth, and the preced-
ing year, \$3,884,000. Germany shows
the greatest falling off. During the
past year we exported to her less than
\$20,000 worth of implements while the
preceding year she required \$3,132,000
worth.

GREAT CONVENIENCE

It is a common expression,
"The auto has brought the farm homes
much nearer to the town and to the
pleasures which come through the
more densely inhabited sections." Not-
withstanding our knowledge of the
convenience of this modern vehicle
we were not prepared for the shock
when a neighbor informed us recently
that he left his home between Los An-
geles and Pasadena at eight o'clock in
the morning with two passengers. He
went to San Diego and out to the ex-
position grounds, spending two hours
there, then drove over to Coronado
and took a dip in the surf, had lun-
cheon and returned home to Los An-
geles and was in bed by eleven
o'clock.

The distance from Los Angeles is
about 130 miles, but the speedometer
indicated about 300 for the round trip.
We grant that but few of the more
careful drivers would have made such
distances and seen so much, but this
feat indicates a bit of the pleasure
that may be had through auto owner-
ship. To have driven this distance
with the ordinary ranch team would
have required a week at least, yet this
trip accomplished on a Sunday per-
mitted the driver to appear at his

desk on Monday morning, ready for
duty excepting a bit of soreness in
ribs and arms. Truly, the auto has
materially lessened the size of the
earth.

35 CENT DOLLAR

To the many whose peaches
are being fed to the hogs there occurs
an inquiry as to the quotations on
peaches and other fruits on the last
two pages of the Cultivator, peaches
being quoted at from 50 cents to a
dollar for small lug boxes. These
look like fairly good prices, and in-
deed they are and practically the
same prices as prevailed last year
when peaches had more real value.
In other words, the consumer is pay-
ing today (where he is securing his
goods through the usual channels of
trade) practically the same that he
did two or three years ago. As the
wholesaler and retailer will express
it "This is certainly true for we are
charging the consumer for our serv-
ices as much as we are for the goods
he consumes." As a matter of fact
at the present time they are charging
vastly more. Mr. Stafford of Los An-
geles, a subscriber who has a few acres
of miscellaneous fruits in the out-
skirts of the city and who is able
to take his fruit directly to the mar-
ket, gives the following prices re-
ceived by him for his fruit delivered:
August 6, two boxes peaches 25 cents
each; Satsuma plums, 30 cents. Au-
gust 10, four boxes peaches 25 cents
each; two Damson plums 35 cents.
August 12, two boxes plums 32½ cents
each; two boxes peaches 20 cents
each; or a total for the 14 boxes of
\$3.85 from which commission was de-
ducted, leaving only \$2.45. In this
case there was no freight, but con-
sidering the three deliveries, cost of
raising and picking, how much was left
for net profit? Mr. Stafford concludes
that the only salvation of the small
fruit grower is cooperation. With
one selling head it will be possible to
secure for each grower at nominal
cost a far better return. At present
he is not receiving by any means even
one-third of the consumer's dollar.

THE POWER OF CREDIT

In an address made by David
Lubin before the Cincinnati chamber
of commerce he said in part: "Some
two years ago when the American
Commission was at Nieweid, a town
several hours from Coblenz on the
Rhein, there was a celebration com-
memorating the life of one of the
founders of rural credit in Germany,
Father Reiffeisen, and the committee
of arrangements asked me to speak in
the name of the American Commis-
sion. I did so by stating that in my
opinion there was one nation among
the great powers that possessed great-
er resisting force; that would when
put to the test transcend the strength
and endurance of all the other powers
that might be brought to bear against
it—that this power was Germany. A
close study will show that the real
strength of the German nation came
as a result of her landwirtschaftsrat
system of scientific distribution of her
agricultural products and her efficient
and effective systems of rural credit,
especially her landschaft system of
rural credit. It was these two sys-
tems that enabled the farmers of Ger-
many to see, hear and walk within the
field of commercial experience as radi-
cally and normally as those engaged
in financial and commercial projects
in the cities. This is the cause that
made Germany strong."

Now we are told that Germany is not
only conducting a great war but is
keeping up improvement of her water-
ways and even extending her railway
systems. Prussia, which is only a
little more than twice the area of the
state of California, has spent \$130,000
on her waterways and in her state-
owned railways has in excess of
\$2,225,000,000 invested. In other
words, Germany has become great
because of building up and car-
ing for its own. Here is a great les-
son for America which is ably touched
upon in "National Defense, the Pa-
triotism of Peace," by George H. Max-
well. We will touch upon this book
and the suggestions of Mr. Maxwell
in next week's Cultivator.

Agricultural Notes

According to a list issued by the
agricultural societies' branch of the
department of agriculture of Ontario,
Canada, 308 fairs are to be held in the
province the coming fall.

An Eastern farmers' club has been
discussing the question of what kind
of phosphoric acid a man has to eat
in order to give him what is called a
"bonehead." The decision is that the
bonehead seems to belong to the one
who does not use any phosphoric acid.

The department of agriculture,
which has been investigating the pro-
cess of pasteurizing milk in bulk and
bottling while hot in hot steamed bot-
tles, has found that the new process
eliminates danger of bottle infection,
with the further advantage of saving
in loss of milk by evaporation over the
old method.

The harvest of winter wheat in
European Russia is forecasted at
301,508,000 bushels by the Interna-
tional Institute of Agriculture at
Rome; rye at 941,736,000 bushels.
These are increases over last year of
40.3 and 19.6 per cent, respectively.
The figures refer to all European
Russia, except Poland.

The American Chamber of Com-
merce of China has been organized at
Shanghai to affiliate with the Chamber
of Commerce of the United States, in
particular, and with other commercial
organizations in general. Provision is
made for admission to membership of
all Americans engaged in business, in-
cluding those employed by foreign
firms that promote American trade.

"Fairs for Farmers, Not Fakers," is
becoming the slogan of many Eastern
county and local fairs. It has become
the practice the United States over
to turn agricultural fairs into vaude-
ville, this under the claim that the
vaudeville stunts are necessary to se-
cure attendance. We do not believe it
and are glad to see that many mana-
gers of Eastern agricultural fairs are
likewise skeptical.

The department of agriculture has
been making investigations as to the
variation in yield of sugar beets.
They find that the yield in the United
States is lower than that of any other
beet producing country excepting Rus-
sia. The average in Germany is 14.84
tons, in Russia 8.93 and in the United
States 10.17, yet there are many grow-
ers in the United States producing 20
and 30 tons per acre.

European countries find the feeding
of the thousands and even hundreds
of thousands of prisoners which have
been taken no small problem. In fact,
it seems to be the policy to "permit"
the prisoners to work in the fields,
thus growing to an extent at least
their own food. The wages earned by
the prisoners shall contribute to the
improvement of their condition and
the surplus shall be paid over to them
at the time of their liberation after de-
ducting the cost of their maintenance.

Rural sanitation is being discussed
in many European states. It has been
charged that the less sanitary sections
of the great cities are often better
cared for and afford better conditions
than some of the so-called mountain
resorts which have not been under
sanitary policing. Impure water and
many conditions have been found so
unsanitary that some "resorts" have
been condemned until conditions are
corrected. This campaign is extending
to many farms. The statement is
made that fully one-half of the cases
of typhoid occurring in large cities are
contracted in country districts during
the vacation season. The movement
is a wise one.

Agricultural News Notes

of the Pacific Coast

Northern California

The Yuba City cannery has opened for the season and is operating on Phillips Clings.

Rice farmers in the Richvale Colony, Butte County, are organizing a cooperative marketing association.

Woodland, Yolo County, is considering joining with Esparto in its Almond Festival to be held September 4.

The recently enacted pure milk law, which has aroused much interest among dairy owners, will not go into effect until October, 1916.

The last of the 1914 hop crop of Mendocino County has been sold at a reported price of 13½ cents, the highest price reported for the year in that section.

Report comes from Newman, Stanislaus County, that within the past few weeks 100 head of cattle on the Miller and Lux ranch have died from Texas fever.

Big preparations are making for the St. Helena Vintage Festival and Napa County farm bureau fair. There will be a stock parade on September 4 at 10 o'clock.

Beekeepers of Yolo County have presented a petition to the supervisors asking for the appointment of an inspector to go through the apiaries of the county to inspect for foul brood.

A bunch of 25 fruit growers in the Healdsburg section who brought suit against the Producers' Fruit Company of Sacramento to collect for fruit sold two years ago have won their case.

Sheep raisers of northern Sonoma and southern Mendocino Counties met in Cloverdale last Tuesday with State Veterinarian Keane. The object of the meeting was to discuss plan for eradicating sheep scabies.

A number of olive growers of Oroville, Butte County, are talking of establishing a cooperative pickling plant at that place. A committee on organization was appointed consisting of E. P. Hilborn, H. Davis, W. J. Moore, E. W. Fogg, N. B. Crane.

The question has been raised that a misplaced comma in the title of the new fruit standardization law might change the intent of the law so that its provisions would apply to fruit intended for sale within the state. Attorney General Webb has ruled that it does not.

The state veterinarian was given additional powers by the recent legislature that will enable him more effectively to control infectious diseases among stock. The provisions of the new law went into effect August 7. This bill was passed with particular reference to control of hog cholera.

Mr. R. N. Hagen, assistant state leader in boys' agricultural clubs, recently visited the members of the agricultural high school clubs at Orland and Willows. The boys in these clubs are carrying on a corn contest, the Orland boys raising corn under irrigation and the Willows club making their trials under dry land methods.

Central California

Bean growing is being demonstrated a success in Kern County.

Experimental rice crops planted in Merced County are averaging 40 sacks to the acre.

The San Joaquin County Dairy-men's Association has now more than 1000 cows on test.

Merced is making many shipments of horses and mules to eastern points for transshipment to Europe.

Farm Adviser Mills of Solano County is starting a campaign for planting the main highways with nut trees.

The packing of raisin grapes has started in Fresno County vineyards. The first to ripen are the Seedless.

A minimum price of 75 cents has been fixed for Red Pearmain apples by the Watsonville Apple Distributors.

The beet slicing campaign of the Spreckels sugar factory at Spreckels, Monterey County, will begin Monday, August 30.

The first car of Thompson Seedless from the Alta district of Tulare County averaged \$1.77 per crate on the Chicago market.

The Terra Bella Irrigation district has been organized. The project involves the impounding of the waters of Deer Creek.

Peach growers have lowered prices for cutting to two and a half cents for a 40-pound and three cents for a 50-pound box. The price for day labor has also been cut to \$1.75.

Peach growers of Fresno County met at the chamber of commerce rooms in Fresno on August 18 to consider plans for an organization to handle this year's crop.

Kings County alfalfa growers are receiving eight dollars a ton for all the alfalfa hay they will sell, but most of them are holding for better prices, many expecting to get ten dollars.

The Associated Raisin Company is discouraging early picking of raisin grapes because both quality and weight suffer when the fruit is put on the trays before it is completely cured.

The Watsonville Apple Distributors condemn the shipment of immature apples from the state. They claim that several non-members of the association are guilty of this practice.

The railroads operating in Fresno County are joining in a request to the supervisors to appoint an assistant inspector to Horticultural Commissioner Collins. The railroads declare they are losing much business because of the inability of the commissioner to handle the great number of shipments.

Five hundred and ninety-two rabbits bagged in four hours from one acre of oats is the story that comes from the Blanco district of Monterey County. The story goes that R. J. Vierra was mowing a 100-acre oat field when he noticed the numerous rabbits. He left one acre of grain standing in the center of the field and then called in his neighbors and the neighbors' dogs.

Southern California

The Pala Indians will hold their festival August 25 to 28 at Pala, San Diego County.

Fruit growers of the Sespe district of Ventura County have formed a fumigating district and will purchase a machine.

Lima bean growers of Orange County are considering a proposition to market their beans for three years through A. & H. Levy Company.

An Oxnard bean broker is offering five cents for limas, contingent on his being able to contract 75 per cent of Ventura County's crop.

Members of the Ventura County Cured Fruit Association are reported to be receiving one cent per pound more than growers outside the association.

The record for daily shipment of cantaloupes out of Imperial Valley was broken early this month when the Southern Pacific hauled out 237 carloads within 24 hours.

W. S. Palmer of Claremont has assumed the management of the Rialto Orange and Lemon Association. He was formerly manager of the Claremont Citrus Association.

A crowd of 150 ranchers of Villa Park, Orange County, listened to the first of a series of talks on orchard culture by members of the staff of the citrus experiment station, Riverside.

Several bean growers in the Saticoy district of Ventura County have entered into an agreement to market their beans together. Their combined crop will amount to some 67,000 sacks.

Ventura County reports the sale of about 1000 tons of apricots at prices ranging from five to six and one-half cents. Many growers are holding with the hope of getting seven cents.

The Hemet Walnut Growers' Association met at the Little Lake schoolhouse Wednesday evening, August 18, to hear an address by Manager Thorpe of the California Walnut Growers' Exchange.

At the meeting of the Orange County Cured Fruit Association, held in Santa Ana last Saturday, it was decided to leave the fixing of prices entirely in the hands of the board of directors.

Packing houses of the California Walnut Growers' Association have given up the sulphur bleaching process and will use another bleach which will be much more satisfactory in that the nuts will not become rancid so quickly.
